PHYSICS ABSTRACTS

Physics Abstracts is one of a series of abstracts publications produced by INSPEC. Published twice monthly by the Institution of Electrical Engineers, it forms the world's major English-language abstracting service for the physics community.

SUBJECT SCOPE & COVERAGE

Physics Abstracts covers the whole field of physics. An impression of its scope can be gained from the classification scheme. The information contained in *Physics Abstracts* is derived from a wide range of sources including journals, reports, books, dissertations and conference papers published in all countries and languages of the world.

The number of items included is currently running at over 100,000 per year.

JOURNALS SCANNED

A list of the journals scanned for the INSPEC services is published with the twice-yearly author indexes to *Physics Abstracts*. Additions and amendments to this list are included in *Physics Abstracts* towards the end of the first issue for each month.

FORM OF ENTRY

All entries in *Physics Abstracts* follow the same basic pattern. The following example identifies the individual parts of a typical entry for an article from a journal.

Entry No. in PA ↓ **Title of paper** ↓

87093 PAC study of molecular rotational motions in dilute solutions.

Authors → A.Baudry, P.Boyer, J.D.Fabris, P.Vulliet (Lab. d'Interactions Hyperfines, CENG, Grenoble, France). ← **Author's affiliation**

Source of paper → *Hyperfine Interactions (Netherlands)*, vol.10, no.1-4, p.1057-62 (June 1981). (Proceedings of the Fifth International Conference on Hyperfine Interactions, Berlin, Germany, 21-25 July 1980).

The rotational tumbling of neutral chelates of hafnium dissolved in several organic solvents was studied via ^{181}Ta DPAC experiments. The results are compared with the predictions of a hydrodynamic model with partial slip boundary conditions. The influence of solute-solvent interactions and/or associations on the quadrupole relaxation is discussed. (16 refs.) } **Abstract**

Entries for other types of material differ mainly in the reference to the source, e.g., a report will refer to the report series and the number of the individual report. A conference paper on the other hand will normally refer to the title, place and date of the conference at which the paper was given.

SUBJECT ARRANGEMENT & SUBJECT GUIDE

The abstracts are arranged by subject in accordance with the scheme in the CLASSIFICATION and CONTENTS which appears opposite. The page number for the start of each subject section is given. An alphabetical index to the scheme—the SUBJECT GUIDE—follows the CLASSIFICATION and CONTENTS.

SUBJECT INDEXES

Detailed twice-yearly subject indexes to the individual entries are provided separately, covering the periods January-June and July-December. In these SUBJECT INDEXES each major concept occurring in each paper abstracted is indexed under headings drawn from the INSPEC Thesaurus.

AUTHOR INDEX

At the end of each issue, an alphabetical index of authors is provided showing the entry number of the items written by them. These indexes are cumulated every six months and, with the addition of the title of the individual papers, are published separately to cover the periods January-June and July-December of each year.

SUBSIDIARY INDEXES

Where appropriate, the following subsidiary indexes are included for the convenience of users:

Bibliography index of articles where a significant list of references or bibliography is contained.

Book index of books received and abstracted.

Corporate Author index where a corporate organisation rather than an individual is responsible for publication. This index includes all reports.

Conference index with reference to individual papers.

Subscription prices and ordering procedure are shown on the inside back cover.

PHYSICS ABSTRACTS is published twice monthly by the Institution of Electrical Engineers in association with the Institute of Electrical and Electronics Engineers Inc. Printed by Unwin Brothers Limited, The Gresham Press, Old Woking, Surrey. 2nd Class postage paid at Piscataway, N.J. 08854, USA. POSTMASTER: Send address changes to INSPEC/IEEE SERVICE CENTER, 445 Hoes Lane, Piscataway, N.J. 08854.

Physics Abstracts

CLASSIFICATION AND CONTENTS

The abstracts are arranged by subject in accordance with the following scheme. The page number for each section is given. The CLASSIFICATION AND CONTENTS is followed by an alphabetical guide to the scheme, the SUBJECT GUIDE.

The classification scheme is the result of cooperation between INSPEC, the American Institute of Physics, the European Physical Society and the Physics Working Group of the ICSU-AB.

1340F *Electromagnetic form factors; electric and magnetic moments* 7957
1340H *Electromagnetic decays* 7958
1340K *Electromagnetic corrections to strong and weak interaction processes* 7958
1360 Photon and charged-lepton interactions with hadrons 7958
1360F *Elastic and Compton scattering* 7958
1360H *Total and inclusive cross sections* 7958
1360K *Meson production* 7958
1360M *Meson-resonance production* —
1360P *Baryon and baryon resonance production* —
1365 Hadron production by electron-positron collisions 7958
1375 Hadron-induced low- and intermediate-energy reactions and scattering, energy ≤ 10 GeV 7958
1375C *Nucleon-nucleon interactions, including antinucleon, deuteron, etc. (energy ≤ 10 GeV)* 7958
1375E *Hyperon-nucleon interactions (energy ≤ 10 GeV)* —
1375G *Pion-baryon interactions (energy ≤ 10 GeV)* 7958
1375J *Kaon-baryon interactions (energy ≤ 10 GeV)* 7958
1375L *Meson-meson interactions (energy ≤ 10 GeV)* —
1385 Hadron-induced high- and super-high-energy interactions, energy > 10 GeV 7959
1385D *Elastic scattering (energy > 10 GeV)* 7959
1385F *Inelastic scattering, two-particle final states (energy > 10 GeV)* —
1385H *Inelastic scattering, many-particle final states (energy>10GeV)* 7959
1385K *Inclusive reactions, including total cross sections, (energy > 10 GeV)* 7959
1385M *Cosmic ray interactions* 7960
1388 Polarisation in interactions and scattering 7960
1390 Other topics in specific reactions and phenomenology of elementary particles 7960

1400 PROPERTIES OF SPECIFIC PARTICLES AND RESONANCES 7960
1420 Baryons and baryon resonances 7960
1440 Mesons and meson resonances 7960
1460 Leptons 7960
1480 Other and hypothetical particles 7960

2000 **NUCLEAR PHYSICS** 7961

2100 NUCLEAR STRUCTURE 7961
2110 General and average properties of nuclei; properties of nuclear energy levels 7961
2110D *Binding energy and masses* 7961
2110F *Shape, charge, radius and form factors* 7961
2110H *Spin, parity, and isobaric spin* 7962
2110J *Spectroscopic factors* —
2110K *Electromagnetic moments* 7962
2110M *Level density and structure* 7962
2130 Nuclear forces 7962
2140 Few-nucleon systems 7962
2160 Nuclear-structure models and methods 7962
2160C *Shell model* 7963
2160E *Collective models* 7963
2160F *Models based on group theory* 7963
2160G *Cluster models* 7964
2160J *Hartree-Fock and random-phase approximations* 7964
2165 Nuclear matter 7964
2180 Hypernuclei 7964
2190 Other topics in nuclear structure —

2300 RADIOACTIVITY AND ELECTROMAGNETIC TRANSITIONS 7964
2320 Electromagnetic transitions 7964
2320C *Lifetimes and transition probabilities* 7965
2320N *Internal conversion and extranuclear effects* 7965
2340 beta decay; electron and muon capture 7965
2360 alpha decay 7965
2390 Other topics in nuclear decay and radioactivity 7965

2400 NUCLEAR REACTIONS AND SCATTERING: GENERAL 7966
2410 Nuclear reaction and scattering models and methods 7966
2410H *Optical and diffraction models* 7966
2430 Resonance reactions and scattering 7966
2450 Direct reactions 7966
2460 Statistical theory and fluctuations 7966
2470 Polarization in reactions and scattering 7967
2475 General properties of fission 7967
2490 Other topics in nuclear reactions and scattering, general —

2500 NUCLEAR REACTIONS AND SCATTERING: SPECIFIC REACTIONS 7967
2510 Nuclear reactions and scattering involving few-nucleon systems 7967
2520 Photonuclear reactions and photon scattering 7967
2530 Lepton-induced reactions and scattering 7967
2540 Nucleon-induced reactions and scattering 7967
2550 ^{2}H- and ^{3}H-induced reactions and scattering 7968
2560 ^{3}He- and ^{4}He-induced reactions and scattering 7968
2570 Heavy ion induced reactions and scattering 7968
2580 Meson- and hyperon-induced reactions and scattering 7969
2585 Fission reactions 7969
2588 Fusion reactions 7970
2590 Other topics in nuclear reactions and scattering: specific reactions —

2700 PROPERTIES OF SPECIFIC NUCLEI LISTED BY MASS RANGES 7970
2710 $A \leq 5$ 7970
2720 $6 \leq A \leq 19$ 7970
2730 $20 \leq A \leq 38$ 7970
2740 $39 \leq A \leq 58$ 7970
2750 $59 \leq A \leq 89$ 7970
2760 $90 \leq A \leq 149$ 7970
2770 $150 \leq A \leq 189$ 7971
2780 $190 \leq A \leq 219$ 7971
2790 $220 \leq A$ 7971

2800 NUCLEAR ENGINEERING AND NUCLEAR POWER STUDIES 7971
2820 Neutron physics 7971
2841 Fission reactor theory and design 7971
2842 Fission reactor materials 7972
2842H *Fuel preparation and reprocessing* 7977
2843 Fission reactor operation 7977
2844 Fission reactor protection systems, safety and accidents 7977
2850 Fission reactor types and applications 7979
2852 Fusion reactors 7979
2858 Integrated reactor systems 7980
2870 Nuclear explosions 7980
2880 Radiation technology, including shielding 7980
2890 Other topics in nuclear engineering and nuclear power studies 7981

2900 EXPERIMENTAL METHODS AND INSTRUMENTATION FOR ELEMENTARY-PARTICLE AND NUCLEAR PHYSICS 7981
2910 Preacceleration (injection) 7981
2915 Electrostatic and linear particle accelerators 7982
2920 Cyclic accelerators and storage facilities 7987
2925 Particle sources and targets, preparation and technology 7996
2930 Radiation spectrometers and spectroscopic techniques 8015
2940 Radiation detectors 8015
2960 Counting circuits and nuclear electronics 8017
2970 Radiation measurement, detection and counting 8017
2975 Polarization analysis —
2980 Nuclear information processing 8018
2990 Other topics in high-energy and nuclear experimental methods and instrumentation 8018

3000 **ATOMIC AND MOLECULAR PHYSICS** 8018

3100 THEORY OF ATOMS AND MOLECULES 8018
3110 General theory of structure, transitions and chemical binding 8018
3115 General mathematical and computational developments 8019
3120 Specific calculations and results 8019
3120D *Complete ab initio calculations (exact or nearly exact calculations on small species)* —
3120E *Ab initio LCAO and GO SCF calculations* 8021
3120G *Other accurate, or nearly ab initio calculations (DIM method, SAMO method, etc.)* 8022
3120L *Statistical model calculations (Thomas-Fermi and Thomas-Fermi-Dirac models)* 8022
3120N *Semi-empirical NDO calculations (CNDO, INDO, MINDO, PCILO methods, etc.)* 8022

		page
3120P	*Other semi-empirical calculations (Hückel, generalized Hückel, PPP methods, etc.)*	—
3120R	*Valence bond calculations (ab initio or not)*	8022
3120T	*Electron correlation and CI calculations*	8022
3120W	*Empirical methods (nonquantum methods for conformations, as Wiberg method, Westheimer method, etc.)*	—
3130	Corrections to electronic structure	8023

3320B	*Radiofrequency and microwave spectra*	8030
3320E	*Infrared spectra*	8031
3320F	*Raman and Rayleigh spectra*	8033
3320K	*Visible spectra*	8033
3320L	*Ultraviolet spectra*	8034
3320N	*Vacuum ultraviolet spectra*	8034
3320R	*X-ray spectra*	8034
3325	Nuclear magnetic resonance and relaxation; nuclear quadrupole resonance (NQR)	8034
3330	Electron paramagnetic resonance and relaxation	8035
3335	Double resonances and other multiple resonances	8035
3335H	*MODR and PMDR (microwave optical double resonance and phosphorescence microwave double resonance)*	8035
3340	Mössbauer spectra	8036
3345	Magneto-optical and electro-optical spectra; dichroism	8036
3345B	*Zeeman and Stark effects*	8036
3345C	*Magnetic circular dichroism*	—
3350	Fluorescence, phosphorescence; radiationless transitions (intersystem crossing, internal conversion)	8036
3365	Photoelectron spectra	8037
3370	Intensities and shapes of molecular spectral lines and bands	8038
3380	Photon interactions with molecules	8038
3380B	*Level crossing and optical pumping*	8038
3380E	*Autoionization, photoionization, and photodetachment*	8038
3380G	*Diffuse spectra; predissociation, photodissociation*	8039
3380K	*Multiphoton processes*	8040
3390	Other topics in molecular spectra and interactions with photons	—
3400	ATOMIC AND MOLECULAR COLLISION PROCESSES AND INTERACTIONS	8040
3410	General theories and models	8040
3420	Interatomic and intermolecular potentials and forces	8040
3440	Elastic scattering of atoms and molecules	8042
3450	Inelastic scattering of atoms and molecules	8042
3450E	*Rotational and vibrational energy transfer*	8043
3450H	*Electronic excitation and ionization (inc. beam-foil excitation and ionization)*	8044
3450L	*Chemical reactions, energy disposal, and angular distribution, as studied by atomic and molecular beams*	8044
3470	Charge transfer	8044
3480	Electron scattering	8045
3480B	*Elastic scattering of electrons by atoms and molecules*	8045
3480D	*Atomic excitation and ionization by electron impact*	8046
3480G	*Molecular excitation, ionization, and dissociation by electron impact*	8046
3490	Other topics in atomic and molecular collision processes and interactions	8047
3500	PROPERTIES OF ATOMS AND MOLECULES; INSTRUMENTS AND TECHNIQUES	8047
3510	Atoms	8047
3510B	*Atomic masses, mass spectra, abundances, and isotopes*	8047
3510D	*Electric and magnetic moments, polarizability*	8048
3510F	*Relativistic corrections, fine- and hyperfine-structure constants*	8048
3510H	*Ionization potentials, electron affinities*	8048
3510W	*Weak Interactions*	8048
3520	Molecules	8048

7450 Proximity effects, tunnelling phenomena, and Josephson effect 8210
7455 Type-I superconductivity 8210
7460 Type-II superconductivity 8211
7460E *Mixed state, H_{c2}, surface sheath* 8211
7460G *Flux pinning; fluxon-defect interactions* 8211
7460J *Critical currents* 8211
7470 Superconducting materials 8211
7470D *Material effects on T_c, K, critical currents* 8211
7470G *Type-I superconductors (non transition metals)* 8212
7470L *Type-II superconductors (transition metals, alloys and compounds)* 8212
7470N *Dirty superconductors* 8212
7470P *Materials for high-field applications* —
7490 Other topics in superconductivity 8212

7500 MAGNETIC PROPERTIES AND MATERIALS 8212
7510 General theory and models of magnetic ordering 8212
7510D *Crystal-field theory and spin Hamiltonians* 8212
7510H *Ising and other classical spin models* 8212
7510J *Heisenberg and other quantized localized spin models* 8213
7510L *Band and itinerant models* 8213
7520 Diamagnetism and paramagnetism 8213
7520C *Nonmetals* 8213
7520E *Metals and alloys* 8214
7520H *Local moment in dilute alloys; Kondo effect* 8214
7525 Spin arrangements in magnetically ordered materials (neutron studies, etc) 8214
7530 Magnetically ordered materials, other intrinsic properties 8214
7530C *Saturation moments and magnetic susceptibility* 8214
7530D *Spin waves* 8215
7530E *Exchange and superexchange interactions* 8216
7530G *Anisotropy* 8216
7530H *Magnetic impurity interactions* 8216
7530K *Magnetic phase boundaries* 8216
7530S *Magnetocaloric effect* 8217
7540 Critical-point effects, specific heats, short-range order 8217
7540D *Ising and other classical spin models* 8218
7540F *Heisenberg and other quantized spin models* 8219
7550 Studies of specific magnetic materials 8220
7550B *Ferromagnetism of Fe and its alloys* 8220
7550C *Ferromagnetism of other metals* 8220
7550D *Ferromagnetism of nonmetals* 8220
7550E *Antiferromagnetics* 8220
7550G *Ferrimagnetics* 8220
7550K *Amorphous magnetic materials* 8220
7550M *Magnetic liquids* 8220
7560 Domain effects, magnetization curves, and hysteresis 8221
7560C *Domain walls and domain structure* 8221
7560E *Magnetization curves, hysteresis, Barkhausen and related effects* 8221
7560G *High coercivity materials* 8222
7560J *Fine-particle systems* 8222
7560L *Magnetic aftereffects* 8222
7560N *Magnetic annealing and temperature-hysteresis effects* 8222
7570 Magnetic films and plates 8222
7570K *Domain structure (magnetic bubbles)* 8222
7580 Magnetomechanical and magnetoelectric effects, magnetostriction 8223
7590 Other topics in magnetic properties and materials 8223

7600 MAGNETIC RESONANCES AND RELAXATION IN CONDENSED MATTER; MÖSSBAUER EFFECT 8223
7620 General theory of resonances and relaxation 8223
7630 Electron paramagnetic resonance and relaxation 8223
7630D *Ions and impurities: general* —
7630F *Iron group (3d) ions and impurities (Ti-Cu)* 8224
7630H *Platinum and palladium group (4d and 5d) ions and impurities (Zr-Ag and Hf-Au)* 8224
7630K *Rare-earth ions and impurities* 8225
7630L *Other ions and impurities* 8225
7630M *Colour centres and other defects* 8225
7630P *Conduction electrons* 8225
7630R *Free radicals* 8225
7640 Diamagnetic and cyclotron resonances 8225
7650 Ferromagnetic, antiferromagnetic, and ferrimagnetic resonances; spin wave resonance 8226
7660 Nuclear magnetic resonance and relaxation 8226
7660C *Chemical and Knight shifts* 8226
7660E *Relaxation effects* 8227
7660G *Quadrupole resonance* 8227
7660L *Spin echoes* 8227
7670 Magnetic double resonances and cross effects 8227
7670D *Electron-nuclear double resonance (ENDOR)* 8227
7670E *Dynamical nuclear polarization* 8227
7670F *Double nuclear magnetic resonance (DNMR)* —
7670H *Optical double magnetic resonance (ODMR)* 8227
7670K *Electron double resonance (ELDOR)* —
7680 Mössbauer effect; other gamma-ray spectroscopy 8228
7690 Other topics in magnetic resonances and relaxation 8228

7700 DIELECTRIC PROPERTIES AND MATERIALS 8229
7720 Permittivity 8229
7730 Polarization and depolarization effects 8229
7740 Dielectric loss and relaxation 8230
7750 Dielectric breakdown and space-charge effects 8230
7755 Dielectric thin films 8230
7760 Piezoelectricity and electrostriction 8231
7770 Pyroelectric and electrocaloric effects 8231
7780 Ferroelectricity and antiferroelectricity 8231
7780B *Transitions and Curie point* 8231
7780D *Domain structure and effects; hysteresis* 8232
7785 Electrical resonances —
7790 Other topics in dielectric properties and materials 8232

7800 OPTICAL PROPERTIES AND CONDENSED MATTER SPECTROSCOPY AND OTHER INTERACTIONS OF MATTER WITH PARTICLES AND RADIATION 8232
7820 Optical properties and materials 8232
7820B *General theory (for pure homogeneous materials)* —

page
7820D *Optical constants and parameters* 8232
7820E *Optical rotatory power* 8233
7820F *Birefringence* 8233
7820H *Piezo-, elasto- and acousto-optical effects* 8233
7820J *Electro-optical effects* 8234
7820L *Magneto-optical effects* 8234
7820N *Thermo-optical effects* —
7830 Infrared and Raman spectra and scattering 8234
7835 Brillouin and Rayleigh scattering 8237
7840 Visible and ultraviolet spectra 8238
7845 Stimulated emission 8238
7850 Impurity and defect absorption in solids 8238
7855 Photoluminescence 8239
7860 Other luminescence spectra and radiative recombination 8242
7860F *Electroluminescence* 8242
7860H *Cathodoluminescence, ionoluminescence* 8242
7860K *Thermoluminescence* 8243
7860M *Sonoluminescence, triboluminescence* —
7860P *Chemiluminescence* —
7865 Optical properties of thin films 8243
7870 Other interactions of matter with particles and radiation 8244
7870B *Positron annihilation* 8244
7870C *X-ray scattering* 8245
7870D *X-ray absorption and absorption edges* 8245
7870E *X-ray emission threshold and fluorescence* 8245
7870G *Microwave and radiofrequency interactions* 8245
7890 Other topics in optical properties of condensed matter and other interactions of matter with particles and radiation 8246

7900 ELECTRON AND ION EMISSION BY LIQUIDS AND SOLIDS; IMPACT PHENOMENA 8246
7920 Impact phenomena 8246
7920D *Laser-light impact phenomena* 8246
7920F *Electron impact: Auger emission* 8246
7920H *Electron impact: secondary emission* —
7920K *Other electron impact phenomena* 8246
7920N *Atom, molecule, and ion impact* 8247
7920R *Atomic and molecular beam interactions* —
7940 Thermionic emission 8247
7960 Photoemission and photoelectron spectra 8247
7970 Field emission and field ionization 8248
7975 Exoelectron emission 8248
7980 Resonance tunnelling —
7990 Other topics in emission and impact phenomena in condensed matter —

8000 CROSS-DISCIPLINARY PHYSICS AND RELATED AREAS OF SCIENCE AND TECHNOLOGY 8248

8100 MATERIALS SCIENCE 8248
8110 Methods of crystal growth and purification 8248
8110B *Growth from vapour* 8248
8110D *Growth from solutions* 8249
8110F *Growth from melts* 8249
8110H *Zone melting and zone refining* 8249
8110J *Growth from solid phases* 8249
8115 Methods of thin film deposition 8249
8115C *Deposition by cathodic sputtering* 8249
8115G *Vacuum deposition* 8250
8115H *Chemical vapour deposition* 8250
8115J *Ion plating and other vapour deposition* 8251
8115L *Deposition from liquid phases (melts and solutions)* 8252
8120 Other methods of preparation of materials 8252
8120C *Vacuum methods* —
8120E *Powder techniques, compaction and sintering* 8252
8120G *Specific metals and alloys (compacts, pseudoalloys)* 8253
8120J *Dispersion-fibre-, and platelet-reinforced metal-based composites* 8253
8120L *Ceramics and refractories* 8253
8120N *Cermets, ceramic and refractory composites* 8254
8120P *Glasses* 8254
8120Q *Glass-based composites, vitroceramics* —
8120S *Polymers* 8254
8120T *Reinforced polymers and polymer-based composites* 8254
8130 Phase diagrams and microstructures developed by solidification and solid-solid phase transformations 8254
8130B *Phase diagrams of metals and alloys* 8255
8130D *Phase diagrams of other materials* 8256
8130F *Solidification* 8256
8130H *Constant-composition solid-solid phase transformations: polymorphic, massive, and order-disorder* 8257
8130K *Martensitic transformations* 8257
8130M *Precipitation* 8258
8140 Treatment of materials and its effects on microstructures and properties 8259
8140C *Solid solution hardening, precipitation hardening, dispersion hardening* 8259
8140E *Cold working, work hardening; annealing, recovery and recrystallisation; textures* 8259
8140G *Other heat and thermomechanical treatments* 8260
8140J *Elasticity and anelasticity* 8262
8140L *Deformation, plasticity and creep* 8263
8140N *Fatigue, embrittlement, and fracture* 8267
8140P *Friction, lubrication, and wear* 8274
8140R *Electrical and magnetic properties (related to treatment conditions)* 8274
8140T *Optical properties (related to treatment conditions)* 8274
8160 Corrosion, oxidation and surface treatments 8274
8160B *Metals and alloys* 8276
8170 Materials testing 8279
8190 Other topics in materials science —

8200 PHYSICAL CHEMISTRY 8285
8220 Chemical kinetics 8285
8220K *Potential energy surfaces for chemical reactions* 8285
8220M *Nonequilibrium kinetics* 8285
8220R *Energy distribution and transfer, relaxation* 8285
8230 Specific chemical reactions; reaction mechanisms 8285
8235 Polymer reactions and polymerization 8287
8240 Chemical kinetics and reactions: special regimes 8288
8240D *Atomic and molecular beam reactions* 8288
8240T *Chemiluminescence and chemical laser kinetics* 8288
8245 Electrochemistry and electrophoresis 8288
8250 Photochemistry and radiation chemistry 8289
8250E *Photodissociation, photoionization as studied by luminescence and radiationless transitions* 8291
8255 Radiochemistry —
8260 Chemical thermodynamics 8291
8265 Surface processes 8292
8270 Disperse systems 8293
8280 Chemical analysis and related physical methods of analysis 8294
8290 Other topics in physical chemistry —

8600 ENERGY RESEARCH AND ENVIRONMENTAL SCIENCE 8296
8610 Energy resources and their utilisation 8296
8610B *Fossil and other fuels* 8296
8610D *Wind energy* 8297
8610F *Tidal and flow energy* —
8610H *Geothermal energy* 8297
8610K *Solar energy* 8297
8610N *Nuclear energy* 8299

SUBSIDIARY INDEXES

SUBJECT GUIDE

The SUBJECT GUIDE is an alphabetical index to subjects covered in the classification scheme, by which the abstracts are arranged. The numbers given are classification codes. The CLASSIFICATION AND CONTENTS, which precede the Guide, gives the page number for each section.

	Classification
A mesons	1440
Ab initio calculations	3120
Aberrations	4180, 4230, 4278
Abrasion	4630P, 6220P, 8140P
Absorptive models	1240P
Acceleration measurement	0630G
Accumulation layers	7320, 7340Q
Acoustic devices	4385
Acoustic holography	4363
Acoustic noise	4350, 4360, 4388, 8670J
Acoustic nuclear magnetic resonance	7660
Acoustic paramagnetic resonance	7630
Acoustic properties of gases	5140
Acoustic properties of liquids	6260
Acoustic properties of solids	6265
Acoustic signal processing	4360
Acoustic wave propagation	4320, 4325, 5140, 6260, 6265
Acoustics	43
Acousto-optical effects	5140, 5170, 7820H
Acoustoelectric effects	4388, 5140, 5150, 7250
Adaptive optics	42
Adherence	4630P
Adhesion	4630P, 6825, 8190
Adsorption	6845, 8265
Aerodynamics	4740
Aeroelasticity	4630C, 4630M
Aeronomy	94
Aerosols	4755K, 8270, 92
Aerospace	9480, 9555
Aerospace biophysics	8765
Ageing	8140G
Airglow	9410Q
Algebra	0210
Alpha decay	2360
Alpha particle-nucleus reactions	2560
Alpha particle-nucleus scattering	2560
Alpha particle spectroscopy	2930
Alpha particles	2140, 2710
Amorphous semiconductors	6140, 7125M, 7220, 7280N
Amorphous state	6140, 81
Anderson model	7110, 7125M, 7155
Anelasticity	4630J, 6240, 8140J

98613 Energy 83. Towards an Energy Policy for Australia.
Barton, Australia: Instn. Eng., Australia (1983), 329 pp.
Conference held at: Canberra, Australia. Date 11-13 May 1983. Sponsors: Australian Inst. Energy; Instn. Eng., Australia. The following topics were dealt with: policy factors affecting energy use and development, resource and production factors both as opportunities and limitations followed by utilisation factors stimulating energy consumption. 18 papers were presented, of which all are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

01.30 PHYSICS LITERATURE AND PUBLICATIONS

01.30B Publications of lectures (advanced institutes, summer schools, etc.)

Polymer physics: organization of macromolecules in the solid state ....See Entry 101592

01.30C Conference proceedings

98614 CRYOSEM '81. Second International Seminar on Low Temperature Physics.
Acta Phys. Acad. Sci. Hung. (Hungary), vol.53, no.3-4 (1982). [received: Aug. 1983]
Conference held at: Visegrad, Hungary. Date 8-10 Oct. 1981. The following topics were dealt with: flux pinning in superconductors; superconducting magnets; properties of type II superconductors; semiconductor physics; thermal conductivity of metals and alloys; metallic glasses. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

98615 Niagara River-Lake Ontario Pollution Problem.
J. Great Lakes Res. (USA), vol.9, no.2 (1983).
Conference held at: Sault Ste. Marie, Ont., Canada. Date May 1982. The following topics were dealt with: Niagara River, Lake Ontario, Canada, pollution, sediment, metals, major elements, geochemistry, radiodating, sedimentology, chlorinated hydrocarbonds, nepheloid layer, P, halocarbon, stratigraphy, bar, water quality, bacteria level, nutrient, Welland River, surface microlayer, biota, phytoplankton, agal membranes, fish and vegetation.

98616 Proceedings of the Topical Meeting of the COSPAR Interdisciplinary Scientific Commission B and Symposium 6 of the COSPAR Twenty-Fourth Plenary Meeting.
Adv. Space Res. (GB), vol.2, no.12 (1982). [received: May 1983]
Conference held at: Ottawa, Canada. Date 16 May-2 June 1982. Sponsors: COSPAR; IAU; et al. Discusses meteorites, inclusions, presolar grains, early Solar System magnetic history, lunar palaeomagnetism, impact magnetisation, interstellar magnetism, comet spacecraft missions, Periodic Comet Halley (1982i), impact processes, asteroids and cratering.

98617 Proceedings of Symposium 1 and Workshop V of the COSPAR Twenty-Fourth Plenary Meeting.
Adv. Space Res. (GB), vol.3, no.2 (1983).
Conference held at: Ottawa, Canada. Date 16 May-2 June 1982. Sponsors: COSPAR; Int. Union Geol. Sci.; URSI; et al. The papers presented at this symposium describe various studies involving the use of remote sensing techiques for geological exploration. Ore and petroleum deposits were considered in a number of papers and describe work in a wide range of countries including the USSR, Yugoslavia, India, Spain, Nepal, China, Sudan, Sierra Leone, USA and Egypt. Other papers describe the geology and crust structure of various regions. Vegetation, chemistry and temporal aspects of ore discovery were also studied. The last group of papers presented discussed the selection of spectral bands for various remote sensing applications. Altogether 42 papers were published which are published in full in the present proceedings.

98618 Proceedings of Symposium 3 of the COSPAR Twenty-Fourth Plenary Meeting.
Adv. Space Res. (GB), vol.3, no.3 (1983).
Conference held at: Ottawa, Canada. Date 16 May-2 June 1982. Sponsors: COSPAR; IAU; URSI; et al. The following topics were dealt with: radiowave emissions from the giant planets, planetary magnetospheres, ring systems, photopolarimetry of Saturn and Titan, Saturnian equatorial haze, Io plasma torus. Altogether 16 papers were presented at this conference.

98619 Proceedings of the 4th ADINA Conference.
Comput. & Struct. (GB), vol.17, no.5-6 (1983).
Conference held at: Cambridge, MA, USA. Date 15-17 June 1983. The conference dealt with applications of the finite element computer program for automatic dynamic incremental nonlinear analysis (ADINA) in a variety of mechanical and civil engineering problems. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

98620 Symposium on Environmental Effects on Fibre-Reinforced Plastics.
Composites (GB), vol.14, no.3 (July 1983).
Conference held at: London, England. Date 12-13 July 1983. Sponsors: Carr Reinforcements; Ciba-Geigy Plastics Div.;Fothergill Rotorway Composites; Hysol Grafil; Pilkington/Fibreglass. The following topics were dealt with: accelerated ageing; analysis of moisture gradients; effect of moisture, acidic and aqueous environments on the properties of fibre reinforced composites; environmental and post-impact fatigue; thermal expansion and long-term durability; stress corrosion cracking and stress-rupture life. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

98621 Optics and Images in Law Enforcement II.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.339 (1982). [received: Aug. 1983]
Conference held at: Arlington, VA, USA. Date 4-5 May 1982. The following topics were dealt with: photographic surveillance using Kodak scientific type emulsions; new directions in the use of infrared technology for drug detection; optics development in the Scientific Research and Development Branch (SRDB); image processing system for the enhancement and deblurring of photographs; disguise detection and identification using infrared imagery; image dynamic range compression for law enforcement; law enforcement applications of high speed videography; image processing operations and systems for legal applications; design of an automatic vehicle surveillance system; second generation night surveillance and low-cost instant surveillance systems.

98622 Field Measurement and Calibration Using Electro-Optical Equipment: Issues and Requirements.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.356 (1983).
Conference held at: San Diego, CA, USA. Date 24-25 Aug. 1982. The following topics were dealt with: measuring the characteristics of the ambient atmosphere; determining the parameters of the battlefield environment; instrumentation and requirements for measurement of transmission and radiance in the field research in remote sensing. 22 papers were presented, of which 14 are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

98623 Industrial and Commercial Applications of Holography.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.353 (1983).
Conference held at: San Diego, CA, USA. Date 24-25 Aug. 1982. The following topics were dealt with: holographic overviews; holographic displays; holographic optical elements; holographic materials and applications of holography. 22 papers were presented, of which 21 are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

98624 Modern Utilization of Infrared Technology VIII.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.366 (1983).
Conference held at: San Diego, CA, USA. Date 26-27 Aug. 1982. The following topics were dealt with: data processing approach to jitter suppression; optical technique for increasing fill factor of mosaic arrays; application of fast IR detectors to detonation science; automatic testing of IR components; atmospheric transmittance derived from radiance measurements; IR imaging techniques for flaw detection in composite materials; near-IR mapping spectrometer for investigation of Jupiter and its satellites; Monte Carlo sets of synthetic background scenes; alternate approaches to cryogenic cooling; advanced low altitude IR Earth sensors; detection range computation by convolution for IR detectors; atmospheric IR emission; observed at altitude of 27000 to 28000 in and transition flow effects on plume radiation. 21 papers were presented, all of which are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

98625 Symposium on Halide and other Nonoxide Glasses.
Glass Technol. (GB), vol.24, no.3 (June 1983).
Conference held at: Cambridge, England. Date 23-26 March 1982. The following topics were dealt with: beryllium fluoride glasses; zirconium as raw material for special glasses; optical properties of fluoride glasses; infrared transmitting materials; chalcogenide glass optical fibres; fluoride glasses of 3d transition metals. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

98626 Meeting of the Nordic Association for Applied Geophysics.
Geoexploration (Netherlands), vol.21, no.4 (1983).
Conference held at: Copenhagen, Denmark. Date 10-12 Jan. 1983. Discusses gravity fields, Nordkalotte Project, data analysis, Greenland, Caledonides, Norway, geomagnetism, Finland, impulse radar, aeromagnetics, trough depths, potential fields, magnetotelluric data, Denmark, Faeroe Islands, thermal conductivity, Scandinavia, temperature logging, marine slides, seismic monitoring, North Sea, Kattegat, faulted reservoir, coal seams, fault structure, Sweden, Libya, prospecting, resistivity, fracture zones, radioactive waste disposal, induced polarisation, Spitzbergen and chemical waste.

98627 Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS.
Helv. Phys. Acta (Switzerland), vol.56, no.1-3 (1983).
Conference held at: Lausanne, Switzerland. Date 28-30 March 1983. Sponsors: Swiss Nat. Sci. Found.; Swiss Soc. Natural Sci.; Federal Inst. Technol. The following topics were dealt with: localisation; quantum Hall effect; itinerant magnetism and valence fluctuations; superconductivity; excitations and electronic states in metals; metallic glasses; polymer glasses; and glass topology; deep centres in semiconductors; semiconductor applications; picosecond spectroscopy; core level spectroscopy; positronium and muonium in solids; atomic structure of solids; interface structure and electronic properties; small particles, clusters and colloids; lattice dynamics; excitations in low dimensional systems; phase transitions; structural glasses; sol-gel transitions and percolation; two dimensional melting; macroscopic quantum phenomena; chaos and driven systems. 70 papers are published in full in the present proceedings and

4 as abstracts only. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

98628 8th IEEE International Semiconductor Laser Conference.
IEEE J. Quantum Electron. (USA), vol.QE-19, no.6 (June 1983).
Conference held at: Ottawa, Ont., Canada. Date 13-15 Sept. 1982. The following topics were dealt with: materials characterisation; temperature dependence of long-wavelength lasers; laser modes; high power lasers; short wavelength lasers; new structures; dynamic effects; amplification and reliability. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

98629 On the 90th Anniversary of the Birth of O.Yu. Shmidt.
Izv. Akad. Nauk SSSR Fiz. Zemli, vol.18, no.6 (1982). [received: June 1983]
Conference held at: Moscow, USSR. Date 26-27 Oct. 1981. The following topics were dealt with: cosmogony of the solar system, planetary satellite origin, Earth origin and evolution, and atmospheric and oceanic circulation.

98630 Anton L. Hales Symposium on 'Some Recent Advances in Geophysics'.
J. Geophys. Res. (USA), vol.88, no.B4 (10 April 1983). [received: Aug. 1983]
Conference held at: Dallas, TX, USA. Date 5-6 Oct. 1981. Global seismicity, earthquakes, teleseismic propagation, Rayleigh wave attenuation, crustal structure, East Pacific Rise thermal structure, lithosphere subduction and tectonics.

98631 Analysis and Interpretation of Atmospheric CO_2 Data.
J. Geophys. Res. (USA), vol.88, no.C6 (20 April 1983).
Conference held at: Bern, Switzerland. Date 14-18 Sept. 1981. The following topics were dealt with: the global distribution CO_2 in the atmosphere, CO_2 exchange between the atmosphere and ocean, C isotopes in the atmosphere including tree ring evidence, fossil fuel combustion CO_2, air pollution and C isotope fallout due to nuclear weapons testing.

98632 Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors.
J. Nucl. Mater. (Netherlands), vol.117 (July 1983).
Conference held at: St. Louis, MO, USA. Date 25-28 Oct. 1982. Sponsors: TMS-AIME/ASM Nucl. Metall. Committee; ASM Electr., Magnetic & Opt. Phenomena Activity. The following topics were dealt with: radiation damage analysis in the fusion program; energy dependence of defect production; defect behaviour under fusion irradiation environments; helium partitioning and transport; pulsed irradiation microstructures; ion irradiation effects; effect of irradiation on segregation; irradiation induced creep; martensitic stainless steel fusion structures; neutron irradiation effects in austenitic stainless steels. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

98633 Proceedings of the Conference on Mathematical Analysis and Applications.
J. Math. & Phys. Sci. (India), vol.17, no.2 (April 1983).
Conference held at: Madras, India. Date 12-13 Nov. 1982. The following topics were dealt with: maximum entropy principle; renewal processes; redundant systems; harmonic maps; function algebra; graphs; table matrix L-systems; Dirac equations; Malcev vatieties; lattices. 7 papers were presented, all of which are published in full in the present proceedings. Abstracts of some of the individual papers can be found under the relevant classification codes in this or future issues.

98634 Vacuum Symposium Proceedings (Kobe 1982).
J. Vac. Soc. Jpn. (Japan), vol.26, no.5 (1983).
Conference held at: Kobe, Japan. Date 1982. The following topics were dealt with: diffusion; outgassing; leak detection; diffusion pumps; ion pumps; time-of-flight mass spectrometer; RBS; contamination; surface segregation; sputtering; surface roughness; electron beam bombardment; flash desorption spectroscopy; discharge cleaning; adsorption; electron diffraction; field emission; valves; extended appearance-potential fine structure analysis; ion bombardment; atom-probe analysis; adhesion; film thickness control; ion gun; coating techniques; and ionization. 72 papers were presented, 40 of which are published in full in the present proceedings, and 32 as abstracts only.

98635 European Geophysical Society Symposium on Plasma and Energetic Particles in the Magnetosphere.
J. Geophys. (Germany), vol.52, no.3 (1983).
Conference held at: Leeds, England. Date 23-27 Aug. 1982. The following topics were dealt with: auroral ion precipitation, magnetosphere, density, plasmasphere irregularities motion, magnetopause, boundary layer, flux transfer events, ring current, radiation belts composition, He ions, charge and high energy electrons.

98636 Proceedings of the Workshop on 'Cosmic Magnetic Fields' in Honour of Giorgio Abetti.
Mem. Soc. Astron. Ital. (Italy), vol.53, no.4 (1982). [received: June 1983]
Conference held at: Florence, Italy. Date 21-23 Oct. 1982. The following topics were dealt with: magnetic fields on Sun, planetary magnetism, interplanetary fields, interstellar fields, stellar magnetism and high energy sources.

98637 Frascati Workshop 1982: The First Stellar Generations.
Mem. Soc. Astron. Ital. (Italy), vol.54, no.1 (1983).
Conference held at: Vulcano, Eolie, Italy. Date 6-10 Sept. 1982. The following topics were dealt with: early enrichment in the galactic halo, Population II stars, asymptotic giant branch evolution, halo stars, cool stars, abundances, nucleosynthesis, metal-poor stars, globular clusters, galactic disks, molecular clouds, open stellar systems, Population III stars, star formation, zero metal stars, s and r process element abundances, supernova remnants, supernovae, and heavy element formation.

98638 Proceedings zum Kolloquium WOPHYS '82. Meteorologische Probleme der Wolkenphysik und ihre theoretische und instrumentelle Bearbeitung (Proceedings of Colloquium WOPHYS ' 82. Cloud Physics Meteorological Problems Theoretical Instrumentational Workings).
Meteorol. Rundsch. (Germany), vol.36, no.3 (June 1983).
Conference held at: Konigstein, Germany. Date 17-19 May 1982. The following topics were dealt with: The ice production processes in clouds, a probe for measuring cloud droplet concentration, cloud droplet spectrometer probes, cloud condensation nuclei counters, chemical composition of rain, particle scavenging by rain and cloud drops, cloud ice droplet growth and far infrared radiation flux, cloud microphysics and radiation fog.

98639 Symposium uber Kosmologie und Relativistische Astrophysik (Symposium on Cosmology and Relativistic Astrophysics).
Mitt. Astron. Ges. (Germany), no.58 (1983).
Conference held at: Konstanz, Germany. Date 21-25 March 1983. The following topics were dealt with: X-ray sources and pulsars, light element abundances, quantum gravity, and galaxy formation.

98640 Meeting of the Basic Science Section of the British Ceramic Society, 'Fabrication Science 3'.
Proc. Br. Ceram. Soc. (GB), no.33 (May 1983).
Conference held at: London, England. Date 13-14 Dec. 1982. The following topics were dealt with: preparation of powders; vibrocompaction; fibre preparation; superplastic forming. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

98641 Symposium on the Rheological Properties of Polymers. 65th Chemical Conference of the Chemical Institute of Canada.
Polym. Eng. & Sci. (USA), vol.23, no.8 (mid-June 1983).
Conference held at: Toronto, Ont. Canada. Date 30 May-2 June 1982. The following topics were dealt with: the role of rheology in plastics processing; and the use of rheology in characterisation of materials. 22 papers were presented, of which 7 are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

98642 Proceedings of the Fourth Europhysical Topical Conference on 'Lattice Defects in Ionic Crystals'.
Radiat. Eff. (GB), vol.72, no.1-4 (1983).
Conference held at: Dublin, Ireland. Date 29 Aug.-3 Sept. 1982. Sponsors: Aer Lingus; Bank of Ireland; An Bord Bainne; et al. The following topics were dealt with: laser spectroscopy of colour centres; defect structure analysis and deexcitation of defects, relaxation measurements of colour centres; carrier trapping, defect formation, and luminescence properties, irradiation and annealing effects on colour centres. 37 papers were presented, all of which are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

98643 Third Symposium on Recent Crustal Movements and Phenomena Associated with Earthquakes and Volcanism.
Tectonophysics (Netherlands), vol.97, no.1-4 (1983).
Conference held at: Tokyo, Japan. Date 12-13 May 1982. The following topics were dealt with: new results in recent crustal movement studies at a local or regional scale, crustal deformations associated with volcanism, crustal deformations associated with seismic activity, error analysis, computations, and methods of measurements.

98644 Neutron Radiography. Proceedings of the First World Conference.
Dordrecht, Netherlands: Reidel (1983), xvii+1072 pp. [90 277 1528 9]
Conference held at: San Diego, CA, USA. Date 7-10 Dec. 1981. Sponsors: ASTM; American Soc. Nondestructive Testing; British Inst. Nondestructive Testing. The following topics were dealt with: neutron radiography; reactor facilities with nuclear applications; reactor facilities with general applications; general industrial applications; applications in the nuclear industry (fuel); general nuclear industry applications; nonindustrial applications; real-time applications. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

98645 Ninth International Symposium on Machine Processing of Remotely Sensed Data with Special Emphasis on Natural Resources Evaluation.
West Lafayette, IN, USA: Purdue Univ. (1983), x+430 pp.
Conference held at: West Lafayette, IN, USA. Date 21-23 June 1983. Sponsors: IEEE; Crop Sci. Soc. America; Soc. American Foresters; et al. The following topics were dealt with: image science, agricultural applications of remote sensing, natural resource evaluation, feature analysis and transformation, international and domestic technology transfer, scene simulation and modelling, image enhancement, supervised and unsupervised classification, thematic mapper data processing, and geographical information systems.

98646 Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting.
Richland, WA, USA: Battelle Press (1983), xiii+658 pp. [3 540 90856 0]
Conference held at: Richland, WA, USA. Date 19-22 April 1982. The following topics were dealt with: national overviews; high level waste management practices; decontamination and size reduction, incineration technology; high level waste vitrification technology; LLW and ILW management practices; transuranic waste management; alternative high-level waste forms; aqueous treatment technology for non-HLW; remote aspects of treating and handling radioactive wastes; treatment of defense high-level waste; immobilisation technology for non-HLW; treatment of West Valley high-level waste; low-level waste handling; transportation and disposal. 114 papers were presented, of which all are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

98647 Cosmochemistry and the Origin of Life. Proceedings of the NATO Advanced Study Institute.
Dordrecht, Netherlands: Reidel (1983), viii+386 pp. [90 277 1544 0]
Conference held at: Maratea, Italy. Date 1-12 June 1981. Discusses cosmochemistry, origin of life, chemical elements synthesis, interstellar matter, comets, Solar System, chemical evolution, terrestrial early atmosphere composition and climatology, sediment dating, biologically mediated isotope fractionations and molecular fossil record.

98648 Laser Diagnostics and Photochemical Processing for Semiconductor Devices. Proceedings of a Symposium.
New York, USA: North-Holland (1983), xiii+298 pp. [0 444 00782 2]
Conference held at: Boston, MA, USA. Date Nov. 1982. Sponsors: Air Force Office Sci. Res. The following topics were dealt with: photodeposition of metal structures; photoetching of electronic materials; diagnostics of semiconductor structures; photoformation of insulators; diagnostics of conventional and laser processing; photodeposition of semiconductors; photochemical doping. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

98649 Greater Los Angeles Area Energy Symposium.
North Hollywood, CA, USA: Western Periodicals Company (1980), ix+211 pp.
Conference held at: Los Angeles, CA, USA. Date 28 Oct. 1980. Sponsors: Los Angeles Council Eng. Sci. The following topics were dealt with: energy management in industry, commerce, residences and hospitals; transportation fuel and energy conservation; power from central receivers and parabolic dishes; solar powered flight; uranium resources; LWR plant costs; LMFBR conceptual design and safety; nuclear waste disposal; biomass and solid waste energy sources; cogeneration; shale-oil products; geothermal energy; and wind energy. 34 papers were presented, of which 31 are published in full in the present proceedings, and three as abstracts only. Abstracts of individual papers can be found under the relevant classfication codes in this or other issues.

98650 Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics.
Berlin, Germany: Springer-Verlag (1983), xiv+298 pp. [3 540 12276 1]
Conference held at: Sitges, Barcelona, Spain. Date 5-11 Sept. 1982. The following topics were dealt with: random processes; chaotic systems; strange attractors; dynamical systems. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

98651 Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop.
Cambridge, England: Cambridge (1982), xiii+432 pp. [0 521 24732 2]
Conference held at: London, England. Date 3-21 Aug. 1981. The following topics were dealt with: quantum gravity; fields; topology; spontaneous symmetry breaking; supergravity; cosmology; the early Universe; quantisation; supersymmetric Yang-Mills theories. 26 papers were presented, all of which are published in full in the present proceedings. Abstracts of individual papers can be found under the relevent classification codes in this or future issues.

98652 Alloy Phase Diagrams. Proceedings of a Symposium.
New York, USA: North-Holland (1983), xi+436 pp. [0 444 00809 8]
Conference held at: Boston, MA, USA. Date Nov. 1982. The following topics were dealt with: alloy phase stability; applications of thermodynamic models in phase diagram data evaluation; rapid solidification processing; constrained equilibria and specialized phase diagrams; experimental determination of phase diagrams. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

98653 Cohesive Properties of Semiconductors under Laser Irradiation. Proceedings of the NATO Advanced Study Institute.
The Hague, Netherlands: Martinus Nijhoff (1983), xix+614 pp. [90 247 2857 6]
Conference held at: Cargese, Corsica, France. Date 19-30 July 1982. The following topics were dealt with: reordering processes in laser irradiated semiconductors; laser and speckle patterns; laser irradiation and transport theory; phase diagrams, crystal growth and solidification; optical properties and recombination mechanisms of semiconductors; dense plasmas and time resolved Raman studies; plasma annealing and laser sputtering; defects, semiconductor synthesis and laser annealing. 27 papers were presented, all of which are published in full in the present proceedings.

98654 Sixth ESA Symposium on European Rocket & Balloon Programmes & Related Research (ESA SP-183).
Paris, France: ESA (1983), xxi+479 pp.
Conference held at: Interlaken, Switzerland. Date 11-15 April 1983. The following topics were dealt with: national balloon and sounding rocket programmes; the energy budget of the middle atmosphere; Middle Atmosphere Physics Projects; range facilities and range improvements; ionospheric/magnetospheric coupling; ground-based observations; sounding-rocket and balloon technology, and new measuring techniques; materials and life sciences; astrophysics; and the future of sounding-rocket and balloon research in Europe. 80 papers were presented, of which 79 are published in full in the present proceedings, and one as abstract only.

98655 Physics of Superionic Conductors and Electrode Materials. Proceedings of a NATO Advanced Study Institute on the Physics of Superionics Conductors and Electrode Materials.
New York, USA: Plenum Press (1983), vii+281 pp. [0 306 41271 3]
Conference held at: Odense, Denmark. Date 4-22 Aug. 1980. The following topics were dealt with: ion transport models; lattice sums calculations; molecular dynamics and Monte Carlo simulations. 15 papers were presented, all of which are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

98656 Planet Mars. Proceedings of a Workshop (ESA SP-185).
Paris, France: ESA (1982), v+120 pp.
Conference held at: Leeds, England. Date 27 Aug. 1982. The following topics were dealt with: the Martian magnetic environment; the geological evolution of Mars; Martian tectonics; the gravity field of Mars; Kepler at Mars; the aeronomy of the lower atmosphere of Mars; the atmospheres of the terrestrial planets; the solar radiation incident at the top of the Martian atmosphere; CO_2, O_2 and H_2O in the Martian atmosphere; ultraviolet absorption in the Martian atmosphere; the Martian airglow and scattered sunlight; the initial thermal history of Mars; permafrost melting and dissolution of the Martian landscape; Martian volcanic eruptions; and multispectral imaging of Mars. 16 papers were presented, all of which are published in full in the present proceedings.

98657 Laser-Solid Interactions and Transient Thermal Processing of Materials.
New York, USA: Elsevier (1983), xvii+769 pp. [0 444 00788 1]
Conference held at: Boston, MA, USA. Date 1-4 Nov. 1982. Sponsors: US DOE. The following topics were dealt with: energy transfer and phase transformations; crystallisation of amorphous semiconductors; solid and liquid phase phenomena; rapid crystallisation; impurity incorporation and metastable surfaces; transient thermal processing of silicon for devices; crystallisation of silicon on insulators; compound semiconductors; metallic surface alloys. 98 papers were presented, all of which are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

98658 Proceedings of the 1982 CERN School of Physics (CERN 83-05).
Geneva, Switzerland: CERN (1983), ix+304 pp.
Conference held at: Cambridge, England. Date 5-18 June 1982. The following topics were dealt with: experimental tests of gauge theories; fundamentals of QCD; applications of QCD; unification and ground unification; results from the CERN proton-antiproton collider; lattice gauge theory; astrophysics, cosmology and high energy physics. 8 paper were presented, of which all are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

98659 Space Biology with Emphasis on Cell & Developmental Biology Proceedings of a Workshop (ESA SP-206).
Noordwijk, Netherlands: ESA (1983), xiv+123 pp.
Conference held at: Cologne, Germany. Date 9-11 March 1983. Sponsors: Eur. Low Gravity Res. Assoc.; ESA; German Aerospace Res. Establ. The topics dealt with included: the significance of gravity on biological systems; the sensitivity of plants towards gravity; the effects of space environmental factors on cell proliferation; the effect of spaceflight on lymphocyte activation; the effects of microgravity on the mechanisms for genetic recombination; dosimetric mapping inside the Biorack; problems of 0 g simulation with the fast-running Clinostat; the influence of gravity on cell growth and migration; the scientific goals of the D1-mission. 26 papers are published in full in the present proceedings.

98660 Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981.
New York, USA: Plenum (1983), ix+378 pp. [0 306 41038 9]
Conference held at: Freiburg, Germany. Date 31 Aug.-11 Sept. 1981. Sponsors: NATO. This volume explores elementary particle physics and statistical mechanics and by comprehensively comparing their structures and methods gives a deeper understanding of each. Leading physicists from a number of countries examine the structural similarities between elementary particle physics and statistical mechanics, tracing the similarities to their origins. They also provide a comparison of solution and approximation schemes and report on those new results and methods in both fields that are indicative of an intimate connection between them. The contributors present up-to-date information on basic topics in statistical mechanics and phase transitions, dynamical systems, solvable lattice models, lattice gauge theories, and a number of topics illustrative on the interrelationship between the two fields. Supplementary information is provided on experimental implications and neighboring fields. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

98661 Astrophysical Jets. Proceedings of an International Workshop.
Dordrecht, Netherlands: Reidel (1983), xvi+327 pp.
Conference held at: Torino, Italy. Date 7-9 Oct. 1982. Sponsors: Osservatorio Astron. Padova; Soc. Astron. Italiana; et al. The following topics were dealt with: small scale structure of radio sources; radio jets; the quasar 3C 273; the radio galaxy NCG 6251; variable radio sources; optical jets; the BL Lacertae object PKS 0521-36; the spiral galaxy NGC 3310; Centaurus A (NGC 5128); Markarian 335; SS 433; X-ray emission from jets; the Seyfert galaxy NGC 4151; supercritical accretion discs; black hole driven hydromagnetic flows; pressure-confined supersonic jets; magnetic fields; reflection jets; and instabilities in astrophysical jets. 35 papers were presented, all of which are published in full in the present proceedings.

Proceedings of Workshop I of the COSPAR Twenty-Fourth Plenary Meeting .

01.30E Monographs, and collections

98662 Origin and evolution of planetary atmospheres. A.Henderson-Sellers.
Bristol, England: Adam Hilger (1983), xv+240 pp. [0 85274 385 8]
The author describes the development of planetary atmospheres, using the temperature as the fundamental characteristic of the atmospheric environment. The first chapters of the book describe the origin of the Sun and the other bodies of the solar system, and the mechanisms which control the structure of planetary atmospheres during the evolutionary processes. The later chapters deal with the primary evolutionary histories of the planets and their major satellites, and review shorter term climatological changes. The history of the Earth's atmosphere is described in detail, with particular reference to the origin and evolution of life. The book is intended to serve both as a text for taught courses and as a monograph for the research community.

01.30K Handbooks, dictionaries, tables and data compilation

98663 The First Dictionary of the Nomenclature of Celestial Objects (solar system excluded). A.Fernandez, M.-C.Lortet, F.Spite.
Astron. & Astrophys. Suppl. Ser. (France), vol.52, no.4, 186 pp. (June 1983).
Lists acronyms which are used (generally as the leading characters) in source names; it is not a general list of the abbreviations of the names of catalogues. References to the catalogues are given together with notes on X- and γ-ray sources, nomenclature based on constellation names, and objects having individual names. (900 refs.)

98664 Thermochemical properties [of titanium, its compounds and alloys]. O.Kubaschewski (Tech. Hochschule Aachen, Aachen, Germany).
At. Energy Rev. Spec. Issue (Austria), no.9, p.3-71 (1983).
Data tables are given showing heat capacities, entropies, enthalpies and Gibbs free energies of Ti, Ti-H_2, Ti-D_2, halides, oxides, titanates, chalcogenides, pnictides, Ti-C, Ti-Si, Ti-B, Ti-Al, Ti-Cr, Ti-Cu, Ti-Fe, Ti-Hg, Ti-Ir, Ti-Mo, Ti-Mo, Ti-Nb, Ti-Ni, Ti-Pd, Ti-Pt, Ti-V, and Ti-Zr. (219 refs.)

98665 Phase diagrams [of titanium alloys]. O.Kubaschewski-Von Goldbeck (Tech. Hochschule Aachen, Aachen, Germany).
At. Energy Rev. Spec. Issue (Austria), no.9, p.75-197 (1983).
Phase diagrams are given for Ti-Ag, Ti-Al, Ti-As, Ti-Au, Ti-B, Ti-Ba, Ti-Be, Ti-Bi, Ti-C, Ti-Ca, Ti-Cd, Ti-Co, Ti-Cr, Ti-Cu, Ti-Fe, Ti-Ga, Ti-Ge, Ti-H, Ti-Cu, Ti-Fe, Ti-Ga, Ti-Ge, Ti-H, Ti-Hf, Ti-Hg, Ti-In, Ti-Ir, Ti-K, Ti-Li, Ti-Mg, Ti-Mn, Ti-Mo, Ti-N, Ti-Na, Ti-Nb, Ti-Ni, Ti-O, Ti-Os, Ti-P, Ti-Pb, Ti-Pb, Ti-Pt, Ti-Pu, Ti-Re, and all the Ti-rare earth alloys except those with Eu and Yb. (344 refs.)

98666 Crystal structure and density data. I. Intermetallic compounds of titanium. P.Rogl (Inst. of Phys. Chem., Univ. of Vienna, Vienna, Austria).
At. Energy Rev. Spec. Issue (Austria), no.9, p.201-369 (1983).
Deals with binary, ternary, and multi-component compounds of titanium with the metallic elements of the Periodic Table. Not treated are halides and chalcogenides and compounds with the elements of Group VA, with H, B, C, Si and Ge. The first table given comprises structural data of titanium as well as binary intermetallic compounds of titanium. The alloy systems concerned are listed in alphabetical order and the intermetallic compounds of each elemental combination are arranged with increasing content of titanium. The references and notes for each elemental combination indicated under the alloy systems are again listed in alphabetical order. Information on binary compounds in general has been extracted from the higher-order intermetallic systems, but some information is also contained in ternary or high-order combinations with elements not covered (borides, carbides, silicides, germanides, etc.). (769 refs.)

98667 Crystal structure and density data. II. Titanium halides and chalcogenides. H.F.Franzen (Dept. of Chem., Iowa State Univ., IA, USA).
At. Energy Rev. Spec. Issue (Austria), no.9, p.371-438 (1983).
For pt.I see ibid., no.9, p.201 (1983). Data is given on the unit cell dimensions, number of formula units in the unit cell, structural type, crystal system and space group for titanium oxides, sulphides, selenides, tellurides, fluorides, chlorides, bromides, iodides, oxygluorides, oxychlorides, oxybromides, and many different titanates. (370 refs.)

98668 Diffusion [in titanium and its alloys]. O.Kubaschewski (Tech. Hochschule Aachen, Aachen, Germany).
At. Energy Rev. Spec. Issue (Austria), no.9, p.441-60 (1983).
The results of measurements of diffusion rates in titanium and its alloys and compounds are listed in the form of Arrhenius constants, $D=D_0.e^{-Q/Rt}$, where D_0 is given cm^2/s and Q in kcal/mol, which may be converted into kJ/mol by multiplication with 4.185, if required. In the case of titanium the plots of the log D versus 1/T do not always constitute straight lines. The object of this compilation is not to discuss the reasons for this phenomenon but to present data. Curved log D versus 1/T plots are therefore either represented by two Arrhenius equations or pertinent remarks are added as notes. (81 refs.)

98669 Nuclear data sheets for A=108. R.L.Haese, F.E.Bertrand, B.Harmatz, M.J.Martin (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Nucl. Data Sheets (USA), vol.37, no.2, p.289-391 (Oct. 1982).
Nuclear structure information pertaining to A=108 has been reviewed. The level properties obtained from decay and reaction experiments are shown in the drawings. Experimental methods, references, and comments are given in the text. (151 refs.)

98670 Traceable temperatures. An introductory guide to temperature measurement and calibration. J.V.Nicholas, D.R.White.
Wellington, New Zealand: Science Information Division, DSIR (1982), 226 pp. [0 477 06708 5]
This book is an introduction to temperature measurement and calibration. The concept of traceability is used to ensure that a thermometer's calibration is traced to international standards. Organisations which can assist in this are outlined. Various temperature scales are examined and the International Practical Temperature Scale (IPTS) is detailed. Mercury-in-glass thermometers, thermocouples, and platinum resistance thermometers are considered in detail and their care and the best means of calibrating them are also described. Systematic and random errors and the methods of calibration required to evaluate them are discussed. Guidance is given on how to use thermometers to avoid the most common sources of error. Some additional topics included are: thermodynamics, heat transfer, error treatment, and instrumentation for resistance measurement. Other temperature-measuring devices—thermistors, solid state detectors, radiation pyrometers, and resonance thermometers—are outlined.

Ion-implantation dense cascade data .... See Entry 101731

01.30M Textbooks for graduates and researchers

98671 AC loss and macroscopic theory of superconductors. W.J.Carr,Jr..
New York, USA: Gordon & Breach (1983), xii+158 pp. [0 677 05700 8]
The chapters of the book are arranged into three parts; part I deals with introductory material, part II with hysteresis loss in bulk superconductors and part III with multifilament conductors. An attempt has been made to establish a reasonably rigorous framework from which losses in superconductors can be calculated. Emphasis has been placed on simplicity and generality rather than on maximum accuracy for a particular problem. For this reason the London-Bean approximation is used in most of the hysteresis calculations, and for the multifilament conductor, simplifications such as constant permeability are assumed. Some of the results presented are new and untested, and may, in fact, require modification. Loss expressions are given in terms of the magnetic field applied to an individual conductor, and for such a conductor in a coil, careful analysis is required just to obtain the 'applied' field. The book does not include an extensive review of the underlying microscopic physics of superconductors. The focus is on the macroscopic description of bulk material. The principal novel feature is the use of macroscopic field theory to investigate the losses in multifilament conductors. The use of this approach reduces the problem to a solution of a set of Maxwell equations and allows the investigation of a wide range of problems which would be difficult to examine by other means. (50 refs.)

98672 Spectroscopy and excitation dynamics of condensed molecular systems. V.M.Agranovich, R.M.Hochstrasser [Ed.]
Amsterdam, Netherlands: North-Holland (1983), xvi+692 pp. [0 444 86313 3]
This volume is largely concerned with electronic and vibrational excitations having a distinctly molecular identification so that the spectroscopy has a molecular character. These molecular levels are subject to perturbations resulting from interactions amongst the molecules or between the molecules and their environment. Such properties set this class of materials apart from wider band molecular systems and conducting polymers. The subject of this compilation is therefore more concerned with fundamental processes and novel properties, than with new molecular materials. Nevertheless, the subject matter deals with the behavior of many different classes of materials, including molecular crystals, chemically and isotopically mixed crystals, and glasses. Condensed phase spectroscopy originating from the early explorations of molecular luminescence and electronic states, especially in glasses, followed by the postwar decades of experimental and theoretical study of insulating molecular crystals. But new technology has originated new directions for this field. Many of the contributions to the present volume—and indeed a large proportion of current researches in spectroscopy—are dependent on laser methods. Experiments based on lasers have resulted in measurements being made of condensed phase properties that were hitherto unknown. These include homogeneous lineshapes, inelastic interactions, coherent energy transport, quasiparticle scattering and new optical effects. The measurements have in turn stimulated new theoretical investigation especially in quantum statistical mechanics.

98673 Vacuum technology, thin films, and sputtering. An introduction. R.V.Stuart.
London, England: Academic Press (1983), viii+151 pp. [0 12 674780 6]
This book is written to provide an introduction to vacuum technology in general and the sputtering process in particular. It is written for the novice, whether lab assistant, technician, technologist, engineer, or manager, whose vocation, avocation, and interests necessitate investigating the applications of vacuum technology, thin films, and sputtering. It is expected that those for whom this book is written will have a sufficient technological orientation that their background will enable them to grasp the fundamentals in the manner in which they are presented. It is hoped that experts in the field will find this book helpful in reducing demands on their time for teaching newcomers.

98674 Size effects in thin films. C.R.Tellier, A.J.Tosser.
Amsterdam, Netherlands: Elsevier (1982), ix+310 pp. [0 444 42106 8]
The book contains four chapters concerned with how size effects in thin films affect the (i) electrical properties, (ii) galvanomagnetic properties, (iii) thermoelectric properties, and (iv) mechanical and electromechanical properties. New developments in the theory are presented and the results discussed in the light of experimental findings. Those subjects which could be of interest in the next few years are indicated: such topics include quantum size effects in semiconductors, the effect of a transverse quantizing magnetic field, the correlation between transport properties of metal films and sophisticated models of surface scattering. For any transport property simple analytical expressions are given, if they are known, since they could facilitate a rough qualitative description of the observed phenomena. The authors also attempt to point out the intrinsic limitations of the conduction models in order to avoid blind alleys when interpreting experiments. The book should be useful to those researching in the field or as a reference textbook.

98675 Charged beam interaction with solids. Y.-H.Ohtsuki.
London, England: Taylor & Francis (1983), viii+248 pp. [0 85066 239 7]
The theory of the interactions of electrons, positrons, protons and light and heavy ions with solids and solid surfaces is treated in detail. The phenomena dealt with include channelling and blocking, inelastic scattering of electrons and ions, dechannelling, the effect on the solid of impact of the charged particle and resulting effects on the particle itself, and finally the interactions of charged particles with solid surfaces. Discussion is limited to the first stages of the interactions, and the author does not therefore touch on secondary phenomena, such as secondary particle emission. The book should prove useful to a graduate beginning his or her research in the field, since quite a wide range of material is covered in detail, using mathematics not beyond undergraduate level. (392 refs.)

98676 Quantum theory of magnetism. Second corrected and updated edition. R.M.White.
Berlin, Germany: Springer-Verlag (1983), xi+282 pp. [0 387 11462 9]
The text presents a uniform treatment of the physical principles underlying magnetic phenomena in matter in the context of linear response theory. It provides the reader with a conceptual framework for understanding the wide range of magnetic phenomena as well as the relationship of magnetism to other areas of physics. Since the first edition was published in 1970 there have been numerous advances, and new phenomena have been discovered. These new developments have been incorporated into the original organization, thereby bringing the book up to date as well as indicating the generality of the approach. (186 refs.)

98677 Medical imaging systems. A.Macovski.
Englewood Cliffs, NJ, USA: Prentice-Hall (1983), xiv+256 pp. [0 13 572685 9]
This book is based on a continuously updated set of notes for a graduate course in electrical engineering. It comprises 11 chapters dealing with the following subjects: introduction; linear systems; physics of projection radiography; source considerations in radiographic imaging; recorder resolution considerations; noise considerations in radiography and fluoroscopy; tomography; nuclear medicine; basic ultrasonic imaging; ultrasonic imaging using arrays; selected topics in medical imaging. (61 refs.)

98678 Quantum theory of light. Second edition. R.Loudon.
Oxford, England: Clarendon Press (1983), xiv+393 pp. [0 19 851152 3]
With a view to providing a detailed account of the basic theory required for an understanding of the properties of light and its interaction with atoms, the book bridges the gap between the more formal development of quantum electrodynamics and the application of the theory to the explanation of experimental results written at a post-graduate level, the topics covered include; Planck's radiation law and the Einstein coefficients, quantum mechanics of the atom-radiation interaction, fluctuation properties of chaotic light, the quantised radiation field, interaction of the quantised fields with atoms, photon optics, generation and amplification of light, resonance fluorescence, light scattering and nonlinear optics. (207 refs.)

98679 Quantum processes in polar semiconductors and insulators. H.Stumpf.
Braunschweig, Germany: Vieweg (1983), 2 vol. xii+850 pp.
In this book the physics and the corresponding theory of processes and reactions of ideal and non-ideal, i.e. impure polar semiconductors and insulators are discussed and developed. In particular, binary compounds of the type I-VII and the technically interesting II-VI and III-V types are treated. Based on the quantum theoretical microscopic description of crystals as many-particle systems of electrons and nuclei, a complete deduction is given starting at the microscopic level and finally obtaining quantities which can be compared to the experiment, i.e. average equilibrium and non-equilibrium values of quantum statistical reaction kinetic quantities for combined electron, phonon, and photon processes and reactions with and without external fields. (3522 refs.)

98680 Introduction to optical fibers. A.H.Cherin.
New York, USA: McGraw-Hill (1983), x+326 pp. [0 07 010703 3]
The book is written at senior level undergraduate/first year graduate level and comprises 11 chapters dealing with the following subjects: introduction to optical fibres; EM theory review; basic waveguide equations (wave and ray optics); the dielectric slab waveguide; the step-index fibres; the graded-index fibre; fabrication of optical fibres; fibre measurements; packaging of optical fibres; source coupling, splices and connectors; fibre system examples.

01.30T Bibliographies

98681 **Recent publications in the area of organic conductors and related phenomena.** A.J.Hodina.
Synth. Met. (Switzerland), vol.6, no.1, p.73-98 (June 1983).
A bibliography is given of recent publications in the following areas: general organic conductors; (CH)$_x$ (polyacetylene and derivatives); TTF (tetrathiafulvalene and related compounds); TCNQ (tetracyanoquinodimethane and related compounds); TMSF (tetramethyltetraselenafulvalane and related compounds); miscellaneous charge transfer salts and complexes; one-dimensional systems; NbSe$_3$ and TaS$_3$ (niobium triselenide, tantalum trisulphide and related compounds); charge and spin density wave dynamics; graphite intercalation compounds; and other related intercalation and layered compounds. (238 refs.)

01.40 EDUCATION

98682 **Doing applied science in a college.** R.P.Riesz (Post-Graduate Phys. Dept., American Coll., Madurai, India).
Eur. J. Phys. (GB), vol.4, no.1, p.34-7 (1983).
The under-utilisation of educational resources including teaching staff and the physical assets of colleges is a worldwide phenomenon, which has special consequences for developing nations and other situations with limited resources. The improvement of this situation in a particular Indian college through the introduction of a non-teaching Department of Applied Science is described. The object of this department is to use the ordinary resources of the college, both in manpower and equipment, for non-tutorial purposes in the service of the community, without disturbing or threatening the tutorial role of the college and without any financial cost to the college. Other roles of such a department are described, and a method is described for extending the concept of such a department to other situations. (no refs.)

98683 **Preliminary study of operational level of University students.** M.C.D.Ure (Univ. Federal Fluminense, Niteroi, Brazil).
Rev. Bras. Fis. (Brazil), vol.12, no.2, p.363-74 (June 1982). In Portuguese.
The reasonings used by elementary physics students at UFF to solve four Piagetian tasks (floating bodies, pendulum, probability and correlations) are studied through clinical interviews. These are compared to the answers given by Genevan adolescents, and the differences are examined and discussed. A rough estimate of the percentages of responses corresponding to each operatory level is obtained, for comparison to those obtained by other authors while the difficulties in interpreting them when dealing with adults are considered. (11 refs.)

98684 **Evaluation of laboratory instruction: an alternative proposal.** A.M.F.Passos (Dept. de Ciencias, Univ. Federal do Acre, Rio Branco, Brazil), M.A.Moreira.
Rev. Bras. Fis. (Brazil), vol.12, no.2, p.375-86 (June 1982). In Portuguese.
A study is described, carried out in the area of laboratory instruction in which an alternative is proposed for the evaluation of this instruction, which tries to investigate to what extent students are able to identify the physical phenomenon underlying an experiment, the method used and the answer (results) obtained for the basic question. The research findings suggest that many times the students are not able to identify these aspects which might be characterized as constituting the 'structure' of the experiment. (5 refs.)

98685 Influence of organisation of content on students' cognitive learning: a comparative study. S.S.Peduzzi (Dept. de Fisica, Univ. Federal de Santa Catarina, Florianopolis, Brazil), M.A.Moreira.
Rev. Bras. Fis. (Brazil), vol.12, no.2, p.ds387-404 (June 1982). In Portuguese.
An experiment was carried out in order to investigate possible differences, concerning student's cognitive learning, which could arise from two different approaches to the organization of the content of electricity and magnetism: one based on the learning theory of David Ausubel and the other the traditional one. The experiment was performed with students enrolled in the Physics III course of UFSC. (16 refs.)

01.50 EDUCATIONAL AIDS

98686 Atomic hydrogen and fundamental physical constants. G.W.Series (J.J. Thomson Phys. Lab., Univ. of Reading, Reading, England), D.N.Stacey.
Eur. J. Phys. (GB), vol.3, no.3, p.129-35 (1982). [received: Aug. 1983]
The authors describe techniques which allow the study in undergraduate laboratories of the spectrum of atomic hydrogen. The Rydberg constant, the electron-proton mass ratio, and the fine-structure constant are evaluated from the measurements. The key to the series of experiments is a discharge tube in which atomic lines dominate over the molecular lines. (5 refs.)

98687 A Josephson effect apparatus for the undergraduate laboratory. B.P.Allen, J.E.Whitehouse (J.J. Thomson Phys. Lab., Univ. of Reading, Reading, England).
Eur. J. Phys. (GB), vol.3, no.3, p.136-8 (1982). [received: Aug. 1983]
An apparatus to enable the observation of the Josephson effect is described. Simplifications in the construction make it suitable for use as an undergraduate laboratory experiment. The superconducting tunnel junction is formed after cooling to liquid helium temperature in an ordinary storage dewar. The conductors of a coaxial waveguide serve to draw together the two elements of the junction, which is then irradiated with X-band microwaves transmitted by the guide. Accurate determination of the microwave frequency and the voltage interval between the current steps lead to a value of e/h. (6 refs.)

98688 Use of computers in science education. H.-M.Staudenmaier (Inst. fur Anwendungen der Informatik, Univ. Karlsruhe, Karlsruhe, Germany).
Eur. J. Phys. (GB), vol.3, no.3, p.144-51 (1982). [received: Aug. 1983]
In University teaching computers have mainly been used in computer assisted instruction projects. The author presents further methods for applying computers in science education. The author's approach was to combine the teaching aims of a particular subject—e.g. physics—with aspects of computing relevant to a given application. The author developed a special course as well as two laboratories and now reports on methods and practical experiences. (27 refs.)

98689 On the stability of the hydrogen atom. G.Sauer (Liebig-Schule, Giessen, Germany), W.Kuhn.
Eur. J. Phys. (GB), vol.3, no.3, p.155-8 (1982). [received: Aug. 1983]
Reference to the solution of the Schrodinger equation does not give much physical insight into the problem of stability because it is far from obvious how the conclusion follows from the equation. The common arguments derived from the Heisenberg uncertainty principle are not sufficient to establish the existence of a stable ground state. The proof for a lower bound of the hydrogen hamiltonian may be recast into physical terms by introducing an effective localisation potential. (6 refs.)

98690 Beware of surface tension!. E.Guyon, J.Prost (Lab. d'Hydrodynamique et de Mecanique Phys., Paris, France), C.Betrencourt, C.Boulet, B.Volochine.
Eur. J. Phys. (GB), vol.3, no.3, p.159-68 (1982). [received: Aug. 1983]
Interfacial phenomena play such a crucial role in life processes that the teaching of them must be an essential part of undergraduate programmes in life sciences. However, the role of interfacial tension, seen as a force per unit length of the separation perimeter between different media, is not always clearly seen in this teaching. The authors illustrate the difficulties by considering several problems of radial symmetry, in particular that of a liquid drop laid down on a solid plane or on top of an immiscible liquid, the role of gravity being taken into account. In addition to the boundary condition at the rim of the drop (the classical Young's relation), the balance between the Laplace and the hydrostatic force over the surfaces can be expressed as a condition at the perimeter which should not be confused with the previous condition. The confusion is the cause of unsatisfactory derivations of relations such as capillary ascent in a tube (Jurin's formula). (14 refs.)

98691 A model of the eye for use in medical education. J.Dekker, J.Steketee, G.S.A.M.van de Ven (Dept. of Biological & Medical Phys., Erasmus Univ. Rotterdam, Rotterdam, Netherlands).
Eur. J. Phys. (GB), vol.3, no.3, p.169-73 (1982). [received: Aug. 1983]
A model simulating the operation of the human eye has been constructed for use in a practical medical physics course. The following experiments carried out with the aid of this model are described: (i) Refractive power measurements to determine whether the eye is myopic or hypermetropic, calculation of the refractive power of the lens needed to correct this condition if present and testing of the lens prescribed in this way. (ii) Accommodation measurements. (iii) Simulation of the surgical removal of the crystalline lens of the eye which is often necessary in the treatment of cataract, and calculation of: (*a*) the power of the lens to be implanted in the eye to correct this aphakia, or (*b*) the power of the lens needed to correct the aphakia if no lens is implanted; and testing of the prescribed lenses. (iv) Demonstration of the effect of pupil diameter on depth of focus. (v) Demonstration of the influence of ocular opacity—caused e.g. by cataract—on the sharpness of the image on the retina. (no refs.)

98692 Implicit meanings in physics: students and constants. L.Viennot (Lab. de Didactique de la Phys., Univ. Paris VII, Paris, France).
Eur. J. Phys. (GB), vol.3, no.3, p.174-80 (1982). [received: Aug. 1983]
Statements with implicit meanings are often used in physics. The paper deals with the importance and the possible consequences of such a practice, in the specific realm of constants. The question in fact is what meanings are triggered by common statements containing the word 'constant' and the ensuing difficulties which result. The word 'constant' may evoke a range of meanings with the two following notions at each end: number, the essential being its numerical value; and a constant function of certain variables, the important thing now being the listing of these variables. In this way constants appear as a particular aspect of functions of several variables. The results of an investigation among French and Belgian students at the beginning of their studies at University are reported and analysed. The usual interpretation of the word 'constant' is biased towards the numerical aspect of this notion, at the expense of its functional meaning. Lastly a plea follows for using excercises of 'text criticism' as pedagogical tools in teaching. (3 refs.)

98693 On the mathematical uniqueness of Minkowski space. P.J.Lemos (Dept. of Phys., North Texas State Univ., Denton, TX, USA).
Eur. J. Phys. (GB), vol.4, no.1, p.1-2 (1983).
By using the formalism of Real Clifford Algebras, it is shown that the largest number of dimensions N for which a vector space $\mathbf{V}_{NQ}$ ($Q=+1$ or -1) over the Reals (i.e. one that has a Clifford Algebra $\mathbf{C}_{NQ}$ with pseudoscalar i satisfying $i^2=Q$) gives a unique geometry is $N=4$ with corresponding $Q=-1$. Moreover, the uniquely defined geometry is the one given by the Minkowski metric. (6 refs.)

98694 On the phases of atomic eigenfunctions. M.A.B.Whitaker (New Univ. of Ulster, Coleraine, N Ireland).
Eur. J. Phys. (GB), vol.4, no.1, p.3-4 (1983).
Attention is drawn to the fact that in a number of recent books the relative phases of the given spherical harmonics are not such as will lead to the commonly accepted matrices for quantities such as I_x. Some historical discussion is added. (12 refs.)

98695 Dirac-bracket quantisation of a constrained nonlinear system: the rigid rotator. N.K.Falck, A.C.Hirshfeld (Inst. fur Phys., Univ. Dortmund, Dortmund, Germany).
Eur. J. Phys. (GB), vol.4, no.1, p.5-9 (1983).
The authors discuss the Dirac-bracket quantisation procedure for the nonrelativistic rigid rotator. In cartesian coordinates this system exhibits two important features which are also characteristic of the nonabelian gauge theories, it is constrained, and nonlinear. By comparing to the known solution in polar coordinates the author demonstrate that simple hermiticity conditions are sufficient to allow the unambiguous application of the Dirac quantisation method to such nonlinear dynamical systems. (11 refs.)

98696 Volcanoes on Io. L.M.Celnikier (Lab. d'Astron., Univ. Pierre et Marie Curie, Paris, France).
Eur. J. Phys. (GB), vol.4, no.1, p.10-15 (1983).
The tidal forcing phenomenon used to predict the existence of volcanic activity on Io, is treated from a very simple point of view which nevertheless reproduces to a sufficient accuracy the final conclusions of the prediction, while highlighting the essential physical processes involved. (11 refs.)

98697 Angular momentum in quantum mechanics as a group study topic. W.E.Burcham, M.Jobes (Dept. of Phys., Univ. of Birmingham, Birmingham, England).
Eur. J. Phys. (GB), vol.4, no.1, p.16-23 (1983).
A largely practical approach to the teaching of angular momentum in quantum mechanics at the undergraduate level is described. In an intensive seven week period towards the end of their final year, under-graduates working in pairs perform experiments in nuclear physics which demonstrate some of the important properties of angular momentum. Three experiments are selected and discussed in this article to illustrate the teaching method. The existence of intrinsic spin and parity is investigated by measuring the polarisation of annihilation radiation; the conservation of angular momentum is demonstrated by a measurement of orbital angular momentum in a nucleon transfer reaction and the coupling of angular momenta is illustrated by the method of angular correlation. (12 refs.)

98698 A dynamic model for the demonstration of planetary motions or 'celestial mechanics on the desk'. L.S.Toth (Inst. for General Phys., Eotvos Univ., Budapest, Hungary), A.Bardocz.
Eur. J. Phys. (GB), vol.4, no.1, p.24-33 (1983).
A dynamic model for the demonstration of planetary motion is described. It is a rubber membrane strained on a ring and pulled down in its middle. The 'planets' of the model are small balls moving on the rubber surface. The force acting on the balls is inversely proportional to the distance from the centre so only Kepler's second law is valid for the motion of the balls. The velocity hodograph of the Kepler motion is analysed theoretically and experimentally. The phenomenon of the perturbation of the real planet's motion is modelled, too, with the help of a somewhat bigger ball which also deforms the rubber-surface in its neighbourhood. All the essential cases of the perturbation are modelled, as is the special case: the motion in the Lagrangian-5 resonance point. (1 ref.)

98699 Analogue solutions of linear programs. J.N.Boyd, P.N.Raychowdhury (Dept. of Math. Sci., Virginia Commonwealth Univ., Richmond, VA, USA).
Eur. J. Phys. (GB), vol.4, no.1, p.38-41 (1983).
The general linear program with all variables non-negative is modelled with a circuit of batteries, resistors, voltmeters, and ammeters. From this model, a general analogue solution of the linear program follows. A specific example is taken from game theory. It is suggested that use of analogue techniques may be useful in examining changes in program solutions as the constraints of the problem are varied. (5 refs.)

98700 Quick and easy measurement of the band gap in semiconductors. Y.Canivez (Service de Phys. du Solide, Univ. de l'Etat, Mons, Belgium).
Eur. J. Phys. (GB), vol.4, no.1, p.42-4 (1983).
A simple method for measuring band gap in semiconductors is described, involving transport measurement in a p-n junction. Fairly accurate results are given for germanium, silicon and gallium arsenide. (6 refs.)

98701 Nonlinear optical experiments with solid-state lasers. I.S.Ruddock, G.Scott (Dept. of Natural Philosophy, Univ. of Strathclyde, Glasgow, Scotland).
Eur. J. Phys. (GB), vol.4, no.1, p.45-7 (1983).
A low cost method of recording data in undergraduate experiments employing single-shot solid-state lasers is described. It is demonstrated by its use in the study of optical phase conjugation. (6 refs.)

98702 Magnetic field measurements near a steel plate. L.Kristjansson (Sci. Inst., Univ. of Iceland, Reykjavik, Iceland).
Eur. J. Phys. (GB), vol.4, no.1, p.48-52 (1983).
Measurement of the components of the magnetic field caused by the edge of a large steel plate, provides a simple introduction to the study of potential fields. Results can be compared quantitatively to theoretical derivations. This experiment is particularly useful in geophysics instruction. (2 refs.)

98703 Thermodynamics of stability of nonequilibrium steady states. R.P.Rastogi, Ram Shabd (Gorakhpur Univ., Gorakhpur, India).
J. Chem. Educ. (USA), vol.60, no.7, p.540-5 (July 1983).
Thermodynamic theory of the stability of equilibrium states is well established and good accounts are available in standard textbooks. The stability of nonequilibrium states is of considerable current interest in view of its application to oscillatory processes, limit cycle behavior, and bifurcation phenomena. The thermodynamic theory of stability is well advanced. The purpose of the article is to present a concise and critical account of this important development in nonequilibrium thermodynamics. The criterion for the stability of nonequilibrium steady states has been critically examined for consecutive and monomolecular triangular reactions, autocatalytic reactions, auto-inhibited reactions, and the Lotka-Volterra model. (19 refs.)

98704 External weighing with analytical balances: determination of magnetic susceptibility of inorganic compounds. H.E.Toma, A.M.C.Ferreira, V.K.Lakatos Osorio (Inst. de Quimica, Univ. de Sao Paulo, Sao Paulo, Brazil).
J. Chem. Educ. (USA), vol.60, no.7, p.600-1 (July 1983).
Recently, Eaton and Eaton (1979) have reported a way of working with magnetic susceptibility determination, without changing the functional aspects of a standard analytical balance. Their procedure consists essentially in using small, strong permanent magnets as the weighing body placed directly on the pan, while the sample under investigation is kept suspended by a fixed holder. The paper describes another approach, which has proved highly efficient in providing accurate weighings under circumstances where the sample cannot be placed directly on the balance pan. The approach is based on external weighing, and uses a new, simple apparatus which may be designed for any kind of analytical balance. It has the advantage of not requiring a hole through the base of the balance, as in previous work employing external weighing. (14 refs.)

98705 An inexpensive high pressure optical absorption cell for IR-VIS-UV studies. V.E.Rodgers, C.A.Angell (Purdue Univ., West Lafayette, IN, USA).
J. Chem. Educ. (USA), vol.60, no.7, p.602-4 (July 1983).
Describes an optical cell suitable for high pressure studies between at least −130°C and +150°C which can be assembled for about $50.00 and which is simple to use. (12 refs.)

98706 Two readily-constructed instruments for the teaching laboratory (colorimeter and polarimeter). N.S.Isaacs (Univ. of Reading, Reading, England).
J. Chem. Educ. (USA), vol.60, no.7, p.607-10 (July 1983).
The perennial problem of providing reliable instrumentation in the teaching laboratory on a diminishing budget is seldom solved by the substitution of cheaper models since their performance may be inadequate for the experiments to be performed. The author reports designs for a colorimeter (absorptiometer) and for a polarimeter both of which may be constructed readily with average workshop facilities. Both use light emitting diodes as light sources of various wavelength and photoresistors as the active light receptors, these components being both inexpensive and rugged. Stability and reproducibility are ensured by the use of the double beam principle. The principles of each instrument may be readily understood by the students who use them. (no refs.)

98707 Preparation of polarising sheets. V.R.Dumke, G.Woehl,Jr. (Centro Politecnico Univ. Federal do Parana, Curitiba, Brazil).
Rev. Bras. Fis. (Brazil), vol.12, no.2, p.405-10 (June 1982).
The purpose of the work is to indicate a process for obtaining polarizing sheets in teaching laboratories, increasing the possibilities of experiments and, in some cases, reconditioning damaged equipment. (5 refs.)

98708 On-line computer demonstrations in a visual perception class. M.W.Vernoy (Univ. of California, Irvine, CA, USA).
1982 Western Educational Computing Conference and Trade Show, San Diego, CA, USA, 18-19 Nov. 1982 (CA, USA: California Educ. Comput. Consortium 1982), p.98-102
Several different on-line computer demonstrations for use in a visual perception class are discussed. Included are demonstrations involving such topics as color vision, psychophysical methods, shape constancy, visual information processing and geometrical illusions. Similar demonstrations could be used in many types of science classes. Off-line uses of the materials generated by these programs is also discussed. (6 refs.)

01.60 BIOGRAPHICAL, HISTORICAL, AND PERSONAL NOTES

98709 Abbe's error. J.Rienitz (Inst. of Sci. Microscopy, Univ. of Tubingen, Tubingen, Germany).
Microsc. Acta (Germany), vol.87, no.3, p.335-52 (May 1983).
Up to the present it is considered as one of Abbe's major achievements to have found out a fundamental difference in the image formation of self-luminous and illuminated objects. This idea of Abbe is, however, erroneous. The author first sketches the relevant findings before Abbe. Then some ideas of Abbe as well as his error are described and the latter is refuted. It follows that Abbe's diffraction experiments, originally intended to support the Abbe theory of image formation of illuminated objects, can be interpreted by means of aperture diffraction which Abbe merely conceded to self-luminous objects. Thus aperture diffraction on the one hand and the Abbe manner of consideration on the other are, if the distribution of coherence is considered, two different but completely equivalent manners of representation of the image formation in the microscope. (22 refs.)

Scattering electrons in Budapest (and elsewhere) .... See Entry 98714

01.65 HISTORY OF SCIENCE

98710 Advances in quantum molecular sciences—a tribute to Kenichi Fukui. P.-O.Lowdin (Dept. of Quantum Chem., Uppsala Univ., Uppsala, Sweden).
THEOCHEM (Netherlands), vol.12, p.3-24 (Aug. 1983).
The authors presents a brief historical survey of the development of various concepts in chemistry which has led to the establishment of modern theoretical chemistry and particularly quantum chemistry—to which Professor Fukui has contributed so much. (no refs.)

98711 The Universe from $<10^{-36}$ second to $>10^{30}$ years. II. M.J.Rees (Inst. of Astron., Univ. of Cambridge, Cambridge, England).
Curr. Sci. (India), vol.52, no.11, p.509-17 (5 June 1983).
For pt.I see ibid., vol.20, p.443 (1983). The author traces the history of scientific cosmology and expounds his ideas on various aspects of the Universe, viz. the 'observable Universe', the ultra-early Universe, the far future: 'unseen mass', fine tuning and the anthropic principle. (18 refs.)

98712 The equation of state for solids 1843-1926. E.Mendoza (Dept. of Sci. Teaching, Hebrew Univ., Jerusalem, Israel).
Eur. J. Phys. (GB), vol.3, no.3, p.181-7 (1982). [received: Aug. 1983]
The equation of state for solids was published by Gruneisen in 1926; however it had a long and chequered history before that. A closely similar equation was first written down as early as 1843 on theoretical grounds—where it must be understood that the theories were those prevailing at the time and the mathematical methods were those then acceptable among physicists. The basis was the plausible idea that forces produced by heat (or caloric) were identical with mechanical forces, so that in all metals the thermal expansion coefficient should be proportional to Young's modulus. When the problem was tackled again in the present century, the theoretical model assumed that the law of force between atoms in metals was universal. Only when Gruneisen came to write his third paper was the equation fully understood. (24 refs.)

98713 The inhabitants of the Earth are always burning things. I.J.Murgatroyd (Christ's Coll., Cambridge, England).
Eur. J. Phys. (GB), vol.3, no.3, p.188-90 (1982). [received: Aug. 1983]
A third-year undergraduate's essay written as part of the final honours examinations in science at Cambridge University is presented. It describes the history of the use of combustion by the human race, from the discovery of fire to the development of fusion power. This brief survey is presented in the form of a field report from an extraterrestrial being from Capella II written for the Journal of Applied Psychology of that planet. (no refs.)

98714 Scattering electrons in Budapest (and elsewhere). I.Hargittai (Dept. of Structural Studies, Hungarian Acad. of Sci., Budapest, Hungary).
J. Mol. Struct. (Netherlands), vol.100, p.129-42 (July 1983).
Some of the recent research of the Budapest Electron Diffraction Group is described in anecdotal-historical perspective. The importance of international cooperation is emphasized. (31 refs.)

01.75 SCIENCE AND SOCIETY

98715 FTIR in the service of art conservation. J.C.Shearer (J. Shearer Consulting Inc., Rochester, NY, USA), D.C.Peters, G.Hoepiner, T.Newton.
Anal. Chem. (USA), vol.55, no.8, p.874a-80a (July 1983).
The advent of Fourier transform infrared spectroscopy allows quick analysis of nanogram-size samples with little sample preparation at a reasonable cost. (14 refs.)

02.00 MATHEMATICAL METHODS IN PHYSICS

02.10 ALGEBRA, SET THEORY, AND GRAPH THEORY

98716 Tensor conditions for algebraic spinors. P.R.Holland (Dept. of Phys., Birkbeck Coll., London, England).
J. Phys. A (GB), vol.16, no.11, p.2363-74 (1 Aug. 1983).
The spinor may be defined as an element of a minimal ideal (primitive element) in a Clifford algebra. The author poses the question: what are the necessary and sufficient covariant conditions to be imposed on the antisymmetric tensors of a Clifford number such that it is primitive? The solution to this problem is illustrated for the case of the real Pauli algebra. Special cases of the conditions yield the non-relativistic two-component spinors in spin space and spinor-tensor relations given by previous writers. (31 refs.)

98717 Maximal Abelian subalgebras of real and complex symplectic Lie algebras. J.Patera, P.Winternitz, H.Zassenhaus (Centre de Recherche de Math. Appliquees, Univ. de Montreal, Montreal, Quebec, Canada).
J. Math. Phys. (USA), vol.24, no.8, p.1973-85 (Aug. 1983).
The authors provide guidelines for classifying maximal Abelian subalgebras (MASAs) of the symplectic Lie algebras $sp(2n, \mathbf{R})$ and $sp(2n, \mathbf{C})$ into conjugacy classes under the Lie groups $\mathrm{Sp}(2n, \mathbf{R})$ and $\mathrm{Sp}(2n, \mathbf{C})$, respectively. The task of classifying all MASAs is reduced to the classification of orthogonally indecomposable (OID) MASAs. Two types of orthogonally indecomposable MASAs of $sp(2n, \mathbf{C})$ exist: 1. Indecomposable maximal Abelian nilpotent subalgebras (MANSs). 2. Decomposable MASAs [their classification reduces to a classification of MANSs of $sl(n, \mathbf{C})$]. Four types of orthogonally indecomposable MASAs of $sp(2n, \mathbf{R})$ exist: 1. Absolutely indecomposable MASAs (MANSs). 2. Relatively indecomposable MASAs [their classification reduces to a classification of MANSs of $su(p,q)$ for $p+q=n$]. 3. Decomposable absolutely OID MASAs [involving MANSs of $sl(n, \mathbf{R})$]. 4. Decomposable relatively OID MASAs [involving MANSs of $sl(n/2, \mathbf{C})$, for n even]. Low-dimensional cases of $sp(2n,F)$ ($n=1, 2, 3$, $F=\mathbf{R}$ or $\mathbf{C}$) are treated exhaustively. The algebras $sp(2,\mathbf{R})$, $sp(4,\mathbf{R})$, $sp(6,\mathbf{R})$ have 3, 10, and 30 classes of MASAs, respectively; $sp(2,\mathbf{C})$, $\mathrm{sp}(4,\mathbf{C})$, and $sp(6,\mathbf{C})$ have 2, 5, and 14 classes of MASAs, respectively. For $n \geq 4$ infinitely many classes of MASAs exist. (38 refs.)

02.20 GROUP THEORY

(for algebraic methods in quantum mechanics, see 03.65; for symmetries in elementary particle physics, see 11.30)

98718 Symmetry properties of direct sum systems. D.J.Newman (Dept. of Phys., Univ. of Hong Kong, Hong Kong).
J. Phys. A (GB), vol.16, no.11, p.2375-87 (1 Aug. 1983).
An interpretation of double coset decompositions of groups is given in terms of the construction of systems from similar disjoint subsystems. A natural labelling scheme is developed for the direct product states of systems of this type, providing an extension of the concept of unique labelling. An application of the decoupling transformation to finite direct sum systems is investigated. (21 refs.)

98719 A generalized imprimitivity theorem for a class of POV-measures. S.Twareque Ali (Dept. of Maths., Concordia Univ., Montreal, Quebec, Canada).
Group Theoretical Methods in Physics. Proceedings of the XI International Colloquium, Istanbul, Turkey, 23-28 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.492-4
The author discusses some recently obtained results on the problem of generalizing the imprimitivity theorem of Mackey (1949), to the case where the underlying projection valued measure is replaced by a commutative positive operator valued (POV) measure. A possible extension of the group representation to a K-space is also discussed. (5 refs.)

98720 Inversions in twistor space. P.M.van den Broek (Dept. of Appl. Maths., Twente Univ. of Technol., Enschede, Netherlands).
Group Theoretical Methods in Physics. Proceedings of the XI International Colloquium, Istanbul, Turkey, 23-28 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.495-6
Twistor space T is equal to T^4 with Hermitian form $\langle KL,L'\rangle=L_0L_2'+L_1L_3'+L_2L_0'+L_3L_1'$. Elements of T are called twistors; the rays of T, called projective twistors, form projective twistor space PT. If $L\in T$ and $L\neq O$ one denotes by L the projective twistor with $L\in \mathit{L}$. If $\langle L,L'\rangle=0$ for each $L\in\mathit{L}$ and each $L'\in\mathit{L}'$ then L and L' are said to be orthogonal. Projective twistors correspond to congruences of null lines in compactified Minkowski space. Let C be the conformal group; C has the coset decomposition $C=C_o+pC_o+tC_o+ptC_o$ where C_o is the restricted conformal group, p denotes space inversion and t denotes time inversion. C is isomorphic to the group of transformations of PT which preserve orthogonality; the action of C on PT provides an explicit realisation of this isomorphism. To each transformation of PT which preserves orthogonality there corresponds a unique ray of semilinear transformations (ROST) of T_o. (3 refs.)

98721 Physical group theory and Euclidean space. H.Venables (Portsmouth Polytech., Portsmouth, England).
Group Theoretical Methods in Physics. Proceedings of the XI International Colloquium, Istanbul, Turkey, 23-28 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.497-8
An outline is given of the considerations involved in using group elements in place of Euclidean space. (1 ref.)

98722 Some aspects of random walks on groups. P.W.Kasteleyn (Inst.-Lorentz voor Theoretische Natuurkunde, Leiden, Netherlands).
Group Theoretical Methods in Physics. Proceedings of the XI International Colloquium, Istanbul, Turkey, 23-28 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.499-512
The author is concerned with random walks on countable groups. After the introduction of the main concepts three special subjects are treated: random walks on free groups with a finite number of generators, random walks on certain non-abelian extensions of the additive groups Z^d and random walks on groups with a stochastic colouring. (15 refs.)

98723 Self-triality in statistical mechanics and field theory. R.Shankar (J.W. Gibbs Lab., Yale Univ., New Haven, CT, USA).
Group Theoretical Methods in Physics. Proceedings of the XI International Colloquium, Istanbul, Turkey, 23-28 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.534-40
The author presents a system which exhibits self-triality, a natural extension of the Kramers-Wannier self-duality. There are three complete sets of variables ψ, R and L for describing the system. Any two are disorder variables with respect to the third and the Hamiltonian has the same form when expressed in terms of ψ, R or L. (11 refs.)

02.30 FUNCTION THEORY, ANALYSIS

98724 The development of bivariational principles for the calculation of upper and lower bounds. D.C.Pack (Dept. of Math., Univ. of Strathclyde, Glasgow, Scotland).
Arch. Mech. (Poland), vol.34, no.3, p.275-85 (1982).
Shows how complementary bivariational principles for the calculation of upper and lower bounds to inner products involving the solution of equations of the type $Tf=f_0$ may be developed from simple basic ideas. These are illustrated in detail for the case when T is a linear self-adjoint operator in a real Hilbert space, and the method of extension of the ideas to non-self-adjoint and, finally, to nonlinear operators is shown, with examples of formulae at present available for practical use. (16 refs.)

98725 A new interpolation formula in the form of a continued fraction. B.Michalik (Inst. of Phys., Czechoslovak Acad. Sci., Praha, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.7, p.713-19 (1983).
An interpolation formula in the form of a continued fraction is derived. In the limit case, when the table points are equal, it turns into an expansion of the function into a fraction near the point. The formula can be a useful tool for interpolating singular functions. As an application, a series of methods for solving nonlinear equations is derived, the first two of them being identical with the methods of Halley and Kiss. (5 refs.)

98726 Nonlinear transformations and integrable evolution equations. B.G.Konopelchenko (Inst. of Nuclear Phys., Novosibirsk, USSR).
Fortschr. Phys. (Germany), vol.31, no.5, p.253-96 (1983).
The transformation properties of the partial differential equations integrable by the inverse scattering transform method are considered. It is shown that the nonlinear transformations characteristic to the integrable equations (symmetry groups, Backlund-transformations) and integrable equations themselves are contained in certain universal nonlinear transformations group which is defined by linear spectral problem. (96 refs.)

98727 Symmetries of differential equations. IV.. F.Gonzalez-Gascon (Dept. de Fisica Teorica, Univ. de Salamanca, Salamanca, Spain), A.Gonzalez-Lopez.
J. Math. Phys. (USA), vol.24, no.8, p.2006-21 (Aug. 1983).
For pt.III see Hadronic J., vol.3, p.1457 (1980). By an application of the geometrical techniques of Lie (1971), Cohen (1911), and Dickson (1924), it is shown that a system of differential equations of the form $x_i^{(r_i}=F_i$ (where $r_i>1$ for every $i=1,\ldots,n$, upper bounds have been computed for the maximum number of independent symmetry vectors that these systems can possess: the upper bounds are given by $2n^2+nr+2$ (when $r>2$), and by $2n^2+4n+2$ (when $r=2$). The group of symmetries of $\bar{x}^{(r}=\bar{0}(r>1)$ has also been computed, and the result obtained shows that when $n>1$ and $r>2$ the number of independent symmetries of these equations does not attain the upper bound $2n^2+nr+2$, which is a common bound for all systems of differential equations of the form $\bar{x}^{(r}=\bar{F}(t,\bar{x},\ldots,\bar{x}^{(r-1)})$ when $r>2$. On the other hand, when $r=2$ the first upper bound obtained has been reduced to the value n^2+4n+3; this number is equal to the number of independent symmetry vectors of the system $d\ddot{x}/dt^2=\bar{0}$, and is also a common bound for all systems of the form $d\ddot{x}/dt^2=F(t,\bar{x},d\dot{x}/dt)$. (13 refs.)

98728 Some oscillation theory. W.Leighton (Dept. of Math., Univ. of Missouri, Columbia, MO, USA).
Z. Angew. Math. & Mech. (Germany), vol.63, no.7, p.303-15 (1983).
In the first section the author extends an interesting result due to Nehari (1957) and develops some related ideas. The remainder has principally to do with sufficient conditions for oscillation of solutions of differential equations of the form $y''+p(x)y=0$, where $p(x)$ is at least piecewise continuous on $I:[a,\infty)$ and changes sign infinitely often in I. In the last section, however, some earlier results of the author on focal and σ-points are extended. (19 refs.)

98729 Renormalization of non-analytical unimodal maps. M.Cosnard, A.Eberhard (Lab. IMAG, Grenoble, France).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.262-3
Let U be the set of unimodal continuous selfmaps of $[-1,+1]$. The renormalization operator R is a map from a part V of U in U defined as follows: let f be in V and $\alpha=-f(1)$, $\mathrm{V}x\epsilon[-1,+1]$, $Rf(x)=-{}^1/_\alpha f^2(-\alpha x)$. The authors purpose is to study the properties of R applied to particular subsets of U and to show the differences with Feigenbaum theory of the analytical case. (5 refs.)

02.50 PROBABILITY THEORY, STOCHASTIC PROCESSES, AND STATISTICS

(see also 05. Statistical physics)

98731 On the foundations of the physical probability concept. A.Harkamper, H.-J.Schmidt (Fachbereich Phys., Univ. Osnabruck, Osnabruck, Germany).
Found. Phys. (USA), vol.13, no.7, p.655-7 (July 1983).
An exact formulation of the frequency interpretation of probability is proposed on the basis of Ludwig's concept (1970, 1978) of physical theories. Starting from a short outline of this concept, a formal definition of weak approximate reduction is developed, which covers the reduction of probability to frequency as a special case. (21 refs.)

98732 Chaotic modulation of correlation functions. T.Nagashima, H.Haken (Inst. fur Theoretische Phys., Univ. Stuttgart, Stuttgart, Germany).
Phys. Lett. A (Netherlands), vol.96A, no.8, p.385-8 (25 July 1983).
For a certain family of 1-D maps, the temporal development of autocorrelation functions is analyzed exactly. A qualitatively new feature—chaotic modulation—of the correlation function is reported. (6 refs.)

98733 The nature and correlation of random distributions. R.A.Bagnold.
Proc. R. Soc. London Ser. A (GB), vol.388, no.1795, p.273-91 (8 Aug. 1983).
The ordered patterns of random distributions in many different fields are examined from the viewpoint of an experimental physicist relying on measured facts. By reversing the traditional graphics, that is, by plotting logarithm of frequency against an additive variate scale, the complete pattern can be traced with far greater discrimination. No indisputable evidence has so far been found for the existence of the Gaussian or 'normal' distribution. The general pattern appears as a hyperbola, the exponential asymptotes of which intersect at a value of the logarithm of frequency, ln q, dependent on the arbitrarily chosen interval of measurement. A different but synonymous representation of the same reality is obtained by choosing a different interval. The arbitrariness is removed in a new way by a change of interval such that the asymptotes intersect at the certainty ln $q=0$, i.e. unit probability. The two transformed asymptotes are then represented by the two independent exponentials $q=C_1^{y'}$ and $q=C_2^{y'}$. When and only when this transformation is made, the mode frequency value is predictable in terms of the bases C_1 and C_2 which thereby define the distribution in absolute terms and so, for the first time, allow random distributions in different fields to be correlated. The bases C_1 and C_2 appear as the respective chances of an independent interval or step taken along the variate towards smaller and larger values. The evidence suggests, intriguingly, that Nature restricts the mean chance $\bar{C}$ to the narrow range 0.5 to 0.2, where 0.5 is the even-chance value. (9 refs.)

02.60 NUMERICAL APPROXIMATION AND ANALYSIS

98735 A unified formulation of the construction of variational principles. E.Gerjuoy (Phys. Dept., Univ. of Pittsburgh, Pittsburgh, PA, USA), A.R.P.Rau, L.Spruch.
Rev. Mod. Phys. (USA), vol.55, no.3, p.725-74 (July 1983).
The use of variational principles as a calculational tool is reviewed, with special emphasis on methods for constructing such principles. In particular, it is shown that for a very wide class of problems it is possible to construct a variational principle (VP) for just about any given quantity Q of interest, by routine procedures which do not require the exercise of ingenuity; the resultant VP will yield an estimate of Q correct to second order whenever the quantities appearing in the VP are known to first order. The only significant requirement for application of the routine procedures is that the entities which enter into the definition of Q be uniquely specified by a given set of equations; the equations may involve difference or differential or integral operators, they may be homogeneous or inhomogeneous, linear or nonlinear, self-adjoint or not, and they may or may not represent time-reversible systems. No numerical calculations are presented, but procedures for the construction of VPs are illustrated for numerous quantities Q of physical interest, particularly those Q arising in quantum-mechanical scattering and transition probability calculations. For pedagogical purposes VPs are also derived for several problems in classical and (simple) mathematical physics which the authors hope will prove instructive and perhaps even amusing. The quantum-mechanical quantities Q whose VPs are examined include various matrix elements and the quantum-mechanical eigenfunctions themselves. Topics examined include some points which have not always been appreciated in the literature, such as the necessity for properly specifying the phase when complex eigenfunctions are involved, and the importance of avoiding, wherever possible, formulations requiring the inversion of singular operators. The basic element of the technique is the recognition that the defining equations of a system can be incorporated into the VP as constraints through the use of (generalized) Lagrange multipliers; these can be constants, scalar, vector, or tensor functions of one or more variables, operators, etc. In the typical problem, these Lagrange multipliers L serve as a new set of adjoint functions or entitites, and the construction of the VP simultaneously provides well-defined equations for the L. Moreover, these L often have ready physical significance themselves; for example, they often may be regarded as generalized Green's functions. (213 refs.)

98736 Binomial smoothing filter: a way to avoid some pitfalls of least-squares polynomial smoothing. P.Marchand, L.Marmet (Dept. de Phys., Univ. Laval, Quebec, Canada).
Rev. Sci. Instrum. (USA), vol.54, no.8, p.1034-41 (Aug. 1983).
Some pitfalls of least-squares polynomial (LSP) smoothing (better known to analytical chemists as Savitzky-Golay smoothing) are demonstrated and discussed, as well some remedies. For instance, smoothing by long LSP sequences leads to transmission zeros, phase reversals, and overshoots that may be objectionable in some applications. An alternative method, the binomial smoothing filter is described and some of its properties are presented. It is shown to be preferable to LSP smoothing in many cases. It is faster, better behaved in both the data and the frequency domains for many applications, and simple to use and to program or to implement in hardware. Finally, the action of a filter of a given order is easy to predict. (19 refs.)

98737 Automatic partitioning of certain three-dimensional domains into finite elements. N.P.Tyrkova, I.A.Kholmyanskii (Automobile & Highway Inst., Omsk, USSR).
Strength Mater. (USA), vol.14, no.7, p.925-7 (July 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.7, p.60-1 (July 1982).
An algorithm for the automatic partitioning of certain three-dimensional domains into tetrahedron-type elements is proposed. The following method is adopted for the partitioning. A domain is first partitioned into layers with several sections. Boundary partitioning is performed in each section; in this case, the number of points of the boundary partitioning is the same for all sections. One of the sections is partitioned into triangles using the procedure described by Umanskii (see Probl. Prochn., no.6, p.83-7, 1978). (4 refs.)

03.00 CLASSICAL AND QUANTUM PHYSICS; MECHANICS AND FIELDS

03.20 CLASSICAL MECHANICS OF DISCRETE SYSTEMS: GENERAL MATHEMATICAL ASPECTS

(for applied classical mechanics of discrete systems, see 46.10; for celestial mechanics, see 95.10)

98738 A class of operator equations in nonlinear mechanics. N.W.Bazley (Math. Inst., Univ. of Cologne, Cologne, Germany), R.J.Weinacht.
Appl. Anal. (GB), vol.15, no.1-4, p.7-14 (1983).
A nonlinear evolution equation in Hilbert space is introduced and is shown to govern a broad class of problems of nonlinear solid mechanics. The simplest oscillations of this equation are described by a generalized Lienard equation. (11 refs.)

98739 About an averaging method available in a whole resonance zone for nonautonomous and nonlinear classical Hamiltonian systems. M.Karatchentzeff (Lab. de Thermodynamique des Fluides, Orsay, France), G.Lochak.
Ann. Fond. Louis de Broglie (France), vol.8, no.2, p.155-86 (1983). In French.
The authors extend to nonlinear classical Hamiltonian systems the resonant averaging method. They study an integrable autonomous system perturbed by a time period or pseudo-periodic field, using a generalized Bogolioubov-Mitropolsky method (1963). Approximate solutions are presented which describe the continuous response of the system to the perturbation frequency over a large range. Finally, they illustrate the method for the case of a physical nonlinear pendulum with a periodic parametric perturbation. (12 refs.)

98740 Discrete mechanics of arbitrary order. A.Marciniak (Dept. of Numerical Methods, A. Mickiewicz Univ., Poznan, Poland).
Comput. Methods Appl. Mech. & Eng. (Netherlands), vol.39, no.2, p.159-78 (Aug. 1983).
On the basis of Greenspan's descrete mechanics a new technique for obtaining difference dynamical equations of arbitrary high order is developed. The presented method conserves most of the constants of motion. Numerical examples illustrate this fact. (12 refs.)

98741 Paths to turbulence. J.P.Eckmann (Dept. de Phys. Theorique, Univ. de Geneve, Geneve, Switzerland).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.805-11 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Sometimes, a physicist must step back from his everyday problem and try to understand, or at least to feel, the possibilities offered to him beyond those tools he is accustomed to. The author's aim was to provide such a perspective and to encourage the physicist to consider its applicability in his future research. Such an enterprise cannot provide readymade answers to the major open problems of theoretical physics, and in particular, the author does not answer in any definitive, or even provisional way, the quest for any understanding of the beauties of turbulence. The title was chosen for want of better alternatives. The author's main aim was thus to transmit a set of ideas which seem most helpful in a class of problems of classical physics, although there are some interesting connections with quantum-mechanical problems. (11 refs.)

98742 On periodic orbits of two spheroidal rigid bodies. S.Elshaboury, S.Elkilany (Dept. of Appl. Math., Ain Shams Univ., Cairo, Egypt).
Indian J. Pure & Appl. Math., vol.14, no.6, p.735-40 (June 1983).
The authors consider the problem of the translational rotational motion of two spheroidal rigid bodies which experience no forces other than mutual gravitational attraction. It is assumed that (1) the bodies are homogeneous oblate ellipsoids of revolution and (2) the meridional eccentricities of both components are small parameters. The equations of motion are obtained in canonical Delaunay-Andoyer's elements. Putting the equations on that form simplifies possibility of obtaining the *n*th approximation which agrees with the realistic problem. Also, the conditions for existence of periodic solutions are discussed using the small parameter method of Poincare. (6 refs.)

98743 The classical dynamics of three particles in hyperspherical coordinates. B.R.Johnson (Chem. & Phys. Lab., Aerospace Corp., El Segundo, CA, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.1906-15 (15 Aug. 1983).
Classical dynamics of the three body problem, formulated in hyperspherical coordinates, is investigated. Hamilton's equations of motion are derived and then reduced from 12th order to eighth order. In addition to the general case in which the system moves in three-dimensional space, the special cases of planar motion, collinear motion, and zero angular momentum motion are studied and related. A brief description of the theory of small amplitude vibrations and normal modes in hyperspherical coordinates is also presented. (25 refs.)

98744 A new approach to perturbation theory: star diagrams. J.C.Houard, M.Irac-Astaud (Lab. de Phys. Theorique et Math., Univ. Paris VII, Paris, France).
J. Math. Phys. (USA), vol.24, no.8, p.1997-2005 (Aug. 1983).
Perturbation theory for first-order nonlinear differential equations with source is developed in a new way, and associated with diagrams that are called star diagrams. In some cases the method allows one to express the *n*-point functions in explicit form. (3 refs.)

98745 Symmetries, conservation laws, and time reversibility for Hamiltonian systems with external forces. A.J.Van der Schaft (Math. Inst., Univ. of Groningen, Groningen, Netherlands).
J. Math. Phys. (USA), vol.24, no.8, p.2095-101 (Aug. 1983).
A system theoretic framework is given for the description of Hamiltonian systems with external forces and partial observations of the state. It is shown how symmetries and conservation laws can be defined within this framework. A generalization of Noether's theorem is obtained. Finally a precise definition of time reversibility is given and its consequences are explored. (20 refs.)

98746 Normal form and representation theory. R.Cushman (Math. Inst., Rijksuniv. Utrecht, Utrecht, Netherlands), A.Deprit, R.Mosak.
J. Math. Phys. (USA), vol.24, no.8, p.2102-17 (Aug. 1983).
Representation theory of Lie algebras is called upon to develop a procedure for normalizing a dynamical system with two degrees of freedom in the neighbourhood of an equilibrium when the Hamiltonian $H(x,y,X,Y)$ in the coordinates (x,y) and their conjugate momenta (X,Y) is of the type $H=(X^2+Y^2)/2+V(x,y,X,Y)$, the potential energy V being a sum of homogeneous polynomials in the phase variables of degree strictly greater than 2. The fact that the resulting potential V' is a polynomial in the new coordinates (x',y') and the angular momentum $G'=x'Y'-y'X'$ implies that the normalization is a rotation in the configuration space from a fixed frame to an ideal frame. The technique is intended for normalizing a Hamiltonian in equilibrium at the origin when the Lie derivative associated with the quadratic part is not semisimple, e.g. the planar restricted problem of three bodies at the equilateral equilibrium L_4 when the basic frequencies are equal (Routh's singular case). (29 refs.)

98747 A simple proof of a particular case of C. Siegel's center theorem. R.de la Llave (Univ. of Minnesota, MN, USA).
J. Math. Phys. (USA), vol.24, no.8, p.2118-21 (Aug. 1983).
The author gives an elementary proof of a particular case of C. Siegel's center theorem, based on a method of M. Herman (1981). Even if the proof has less generality than the standard one, it is simpler and provides sharper bounds. (9 refs.)

98748 On the variational theory of linear configuration-dependent systems. J.G.Papastavridis (School of Engng. Sci. & Mech., Georgia Inst. of Technol., Atlanta, GA, USA).
J. Sound & Vib. (GB), vol.89, no.1, p.85-94 (8 July 1983).
The stability of equilibrium of a linear (holonomic and scleronomic), nondissipative and non-gyroscopic, circulatory system is treated via Hamilton's (stationary or varying) action principle, thus showing how the well-known energetic theorems of the virial and work/energy for the adjacent states of motion follow by special choices of the virtual displacements (from these states). The discussion ends with the study of the (first-order) change of the action's variation along the system's eigenvalue (frequency-load) curve; here one finds expressions for the load (reminiscent of the classical Rayleigh's quotient), and the slope of this curve; these results have been discovered by other methods, such as that of the adjoint to the given system. (15 refs.)

98749 Construction of integrable systems by dressing a free motion with a potential. S.Wojciechowski (Inst. of Theoretical Phys., Univ. of Warsaw, Warsaw, Poland).
Phys. Lett. A (Netherlands), vol.96A, no.8, p.389-92 (25 July 1983).
A new family of integrable systems is presented. The construction of this family is based on a Lie algebra associated with the scaling properties of translationally invariant homogeneous potential of order −2. (4 refs.)

98750 On the integrability of some generalized Lotka-Volterra systems. T.C.Bountis (Dept. of Math. & Computer Sci., Clarkson Coll., Potsdam, NY, USA), M.Bier, J.Hijmans.
Phys. Lett. A (Netherlands), vol.97A, no.1-2, p.11-14 (8 Aug. 1983).
Several integrable systems of nonlinear ordinary differential equations of the Lotka-Volterra type are identified by the Painleve property and completely integrated. One such integral case of N first order ode's is found, with $N-2$ free parameters and N arbitrary. The concept of integrability of a general dynamical system, not necessarily derived from a hamiltonian, is also discussed. (20 refs.)

98751 Hamiltonian symmetries of the Henon-Heiles system. A.P.Fordy (Dept. of Maths., Univ of Manchester, Inst. of Sci. & Technol., Manchester, England).
Phys. Lett. A (Netherlands), vol.97A, no.1-2, p.21-3 (8 Aug. 1983).
Hamiltonian symmetries are used to find all the parameter ranges for which the Henon-Heiles Hamiltonian system $H=(\dot{x}^2+\dot{y}^2+c_1x^2+c_2y^2)/2+ax^2y-by^3/3$ is completely integral. (10 refs.)

98752 Conditions for the complete integrability of a dynamical system admitting alternative Lagrangians. M.Crampin (Faculty of Math., Open Univ., Milton Keynes, UK, England), G.Marmo, C.Rubano.
Phys. Lett. A (Netherlands), vol.97A, no.3, p.88-90 (15 Aug. 1983).
Gives conditions of a geometric nature sufficient for a dynamical system (antonomous, with finitely many degrees of freedom) which admits two alternative Lagrangian descriptions (where the Lagrangians are not just trivially related) to be completely integrable, in the sense of having *m* constants of the motion in involution (*m* being the number of degrees of freedom). (9 refs.)

98753 Stability of stationary motion of the symmetrical top with rounded peg. R.Togeiro de Figueiredo (Dept. de Fisica, Univ. Federal de Minas Gerais, Minas Gerais, Brazil).
Rev. Bras. Fis. (Brazil), vol.12, no.3, p.443-58 (Sept. 1982).
The stability of stationary motion of the symmetrical top with rounded peg on a horizontal plane is studied. The possible rolling without sliding stationary motions are not all stable. (2 refs.)

98754 Regions of possible motion in mechanical systems. M.P.Kharlamov (State Univ., Donetsk, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.921-2 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.571-3 (Nov. 1982).
The author considers the dynamical system $\dot{x}=X(x)$, $x \in M$, which has the first integrals K_1, K_2, ..., K_n: $M \rightarrow \mathbf{R}$. As one of the problems related to the analysis of the behavior of the trajectories of the system, Smale (1970) posed the problem of the study of a topological type of integral manifolds, J_K. This problem can be solved by using a classification of the projections of the J_k

onto a certain manifold N (dim N<dim M) which arises in a natural way in mechanics. It is a space of variables which depend only on the configuration of objects. Study of the projections of phase trajectories onto the space of configuration variables is of independent interest, since these projections are directly related to the motions of a real system. (7 refs.)

98755 Weighting coefficient selection in the problem of optimal damping of wing elastic vibrations. T.K.Sirazetdinov, I.Kh.Khalitov.
Sov. Aeronaut. (USA), vol.25, no.2, p.37-42 (1982). Translation of: *Izv. VUZ Aviats. Tekh. (USSR)*, vol.25, no.2, p.35-40 (1982).
The authors present an algorithm for the design of an optimal system for control of an elastic wing with the a priori given requirements on the critical flutter speed and the characteristic of the wing bending-torsion vibration transient process. (6 refs.)

98756 Resonances: key elements to the understanding of nonlinear oscillations. I.Gumowski (Dynamic Systems Res. Group, Univ. of Toulouse, Toulouse, France).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.272-9
The objective of this paper is a critical discussion of problems related to the study of dynamically characteristic properties of solutions of specific equations of the form $\dot{x}=g(x,y,t)$, $\dot{y}=f(x,y,t)$, where t=time, x,y=scalar variables, describing physical evolution processes are considered, where f,g are sufficiently smooth functions of x,y,t and in addition periodic in t with a fixed period T>0, occurring in mechanics. (20 refs.)

98757 On systems passing through resonances. A.Delshams (Facultat de Matematiques, Univ. de Barcelona, Barcelona, Spain).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.280-1 (7 refs.)

98758 Symmetries of finite hard rod systems. P.Kasperkovitz, J.Reisenberger (Inst fur Theoretische Phys., Tech. Univ. Wien, Wien, Austria).
Group Theoretical Methods in Physics. Proceedings of the XI International Colloquium, Istanbul, Turkey, 23-28 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.541-2
The authors consider N particles of mass m and diameter d moving on a line and interacting via elastic collisions. The particles are assumed to be enclosed by a freely movable, massless box of length L. This device makes the system slightly different from that with periodic boundary conditions. (2 refs.)

03.30 SPECIAL RELATIVITY

98759 On the quaternion representation of the proper Lorentz group SO(3,1). K.N.Srinivasa Rao, A.V.Gopala Rao, B.S.Narahari (Dept. of Phys., Univ. of Mysore, Mysore, India).
J. Math. Phys. (USA), vol.24, no.8, p.1945-54 (Aug. 1983).
Complex quaternions are investigated in detail, bringing out some new aspects of the relationship of the multiplicative group of unit complex quaternions (UCQ) with the proper Lorentz group SO(3,1). Constructing the proper Lorentz transformation (PLT) corresponding to a given UCQ, the quaternion parameters of a PLT are determined explicitly in terms of its element L_{ij}, and this quaternion parametrization is then utilized to obtain an interesting geometrical interpretation of SO(3,1) as the intersection of a hyperboloid with a cone in a real eight-dimensional Euclidean space E_8. The UCQ components are then related to the Lie-Cartan parameters of SO(3,1), leading to an identification of complex quantities which may be interpreted as the complex axis and angle of rotation. It is shown that any PLT admits a special type of Euler resolution which is at the same time a resolution into three Lorentz-Synge screws the two angles of which combine to form a complex Euler angle (or Euler-Brauer angle). It is also shown that on taking the rotation parameters in the formula for the D^j representation of SO(3) to be complex, one obtains the D^{j0} representation of SO(3,1); leading at once to its $D^{jj'}$ representation. Similarly, a formula for the character χ^{j0} of the D^{j0} representation, having a complete analogy to the character formula for SO(3), but in terms of a complex angle ω is obtained and this in turn yields a formula for the character $\chi^{jj'}$ in the $D^{jj'}$ representation of SO(3,1). (19 refs.)

98760 The spinning photon. R.A.Waldron (School of Math., Ulster Polytech., Newtownabbey, N Ireland).
Speculations Sci. & Technol. (Switzerland), vol.6, no.2, p.171-81 (June 1983).
A photon travelling with velocity c′ (which will be different from c if the source of the photon is moving with respect to the observer) has an internal energy $^1/_2mc^2$ and a translational kinetic energy $^1/_2$ mc'^2. The internal energy is identified with a spin energy $^1/_2I\omega^2$, ω being the angular velocity of spin and I the moment of inertia. On this view, the wave-like behaviour of light may be understood, including Doppler effect, interference and diffraction. At high frequencies (γ-rays, X-rays) photons are very small, very massive, and usually well separated; they behave as individual particles. At low frequencies (microwaves, radio waves) they are large, of small mass and interpenetrate each other; they behave much less like particles and much more like electromagnetic waves. (4 refs.)

03.40 CLASSICAL MECHANICS OF CONTINUOUS MEDIA: GENERAL MATHEMATICAL ASPECTS

98761 New integrable classical system with two degrees of freedom. V.I.Inozemtsev (Lab. of Theoretical Phys., JINR, Moscow, USSR).
Phys. Lett. A (Netherlands), vol.96A, no.9, p.447-8 (1 Aug. 1983).
It is shown that a classical system with hamiltonian $H=(p_1^2+p_2^2)/2+\lambda(q_1q_2)^{-2/3}$ possesses a constant of the motion $K=p_1p_2(p_1q_2-p_2q_1)+2\lambda(p_2q_2-p_1q_1)(q_1q_2)^{-2/3}$; the quantum system with the same hamiltonian has no constants of the motion which are polynomials in the momenta of order not higher than three, except H. (9 refs.)

98762 Perturbation method in boundary-value problems of the mechanics of deformable bodies. V.D.Kubenko, Yu.N.Nemish, K.I.Shnerenko, N.A.Shul'ga (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Appl. Mech. (USA), vol.18, no.11, p.955-70 (Nov. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.11, p.3-20 (Nov. 1982).
The authors analyze for the most part two- and three-dimensional boundary-value problems for noncanonical domains, where the methods of solution and the vast number of specific results obtained on the basis thereof are attributable to members of the Institute of Mechanics of the Academy of Sciences of the Ukrainian SSR and to their students. The foundation of all these numerous investigations is a version of the boundary perturbation (deformation) method proposed by A.N. Guz in 1962. In the twenty years since that time other versions of the boundary perturbation method have been developed on the basis of the original, and corresponding scientific directions have evolved in the mechanics of deformable media; these topics are discussed. (187 refs.)

98763 Nonequilibrium thermodynamics of surface phenomena in solids. Yu.Z.Povstenko (Inst. of Appl. Mech. & Math., Acad. of Sci., Lvov, Ukrainian SSR).
Sov. Appl. Mech. (USA), vol.18, no.11, p.1035-9 (Nov. 1982). Translation of: *Prikl. Mekh. (USSR)*, vol.18, no.11, p.100-5 (Nov. 1982).
Models a thin interfacial layer on the boundary between a solid $V^{(1)}$ and an external medium $V^{(2)}$ by a surface Σ with certain physicomechanical properties. The problem is to construct a two-dimensional analog of the ideal solid solution model with explicit treatment of specific characteristics of surface phenomena, using the methods of continuum mechanics and nonequilibrium thermodynamics. (15 refs.)

Non-linear mechanics of a string in a viscous noisy environment ....See Entry 99000

03.40D Mathematical theory of elasticity

(see also 46.20 Continuum mechanics, and 46.30 Mechanics of solids)

98764 Homogenization and asymptotic expansions for solutions of the elasticity system with rapidly oscillating periodic coefficients. O.A.Oleinik, G.P.Panasenko (Moscow State Univ., Moscow, USSR), G.A.Yosifian.
Appl. Anal. (GB), vol.15, no.1-4, p.15-32 (1983).
Homogenization for a boundary value problem in linear elasticity is discussed. Justification is given for the asymptotic expansion in powers of a small parameter for a solution to the elasticity system in a half-space with rapidly oscillating periodic coefficients. (17 refs.)

98765 Some uniqueness and continuous dependence theorems for nonlinear elastodynamics in exterior domains. R.J.Knops (Heriot-Watt Univ., Edinburgh, Scotland), L.E.Payne.
Appl. Anal. (GB), vol.15, no.1-4, p.33-51 (1983).
Uniqueness and Holder continuous dependence upon the initial data of the null solution to the initial boundary value problem of nonlinear hyperelasticity are proved for exterior domains subject to mild asymptotic behaviour on the displacement, velocity and stress components. The strain-energy is not required to be locally sign-definite although at sufficiently large spatial distances it must be non-negative. Other limitations impose on the strain-energy become identically satisfied upon reduction to the linear theory. (27 refs.)

98766 The two-dimensional, linear orthotropic plate. R.P.Gilbert, G.C.Hsiao (Dept. of Math. Sci., Univ. of Delaware, Newark, DE, USA), M.Schneider.
Appl. Anal. (GB), vol.15, no.1-4, p.147-69 (1983).
The authors apply the analysis of Ciarlet and Destuynder (1979) to a two-dimensional linear orthotropic clamped plate. (14 refs.)

98767 Mathematical problems in elastic equilibrium with finite deformations. G.Grioli (Istituto di Analisi e Meccanica, Univ. di Padova, Padove, Italy).
Appl. Anal. (GB), vol.15, no.1-4, p.171-86 (1983).
The author considers the equilibrium problem for an elastic body with large deformations. A procedure based on the hypothesis of live loads and a stressed reference configuration is developed. (17 refs.)

98768 A nonconvex generalization of the notion of superpotential and applications. P.D.Panagiotopoulos (Univ. d'Aristote, Salonique, Greece).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.15, p.1105-8 (25 April 1983). In French.
The recent notion of generalized gradient is applied to the study of nonmonotone constitutive laws and boundary conditions. A unified procedure is derived for the study of certain variational inequalities of nonlinear type characterizing these mechanical systems. The notion of convex superpotential is generalized for non-convex energy functions. (9 refs.)

98769 On the automatic solution of nonlinear finite element equations. K.-J.Bathe, E.N.Dvorkin (Dept. of Mech. Engng., MIT, Cambridge, MA, USA).
Comput. & Struct. (GB), vol.17, no.5-6, p.871-9 (1983). (Proceedings of the 4th ADINA Conference, Cambridge, MA, USA, 15-17 June 1983).
An algorithm for the automatic incremental solution of nonlinear finite element equations in static analysis is presented. The procedure is designed to calculate the pre- and post-buckling/collapse response of general structures. Also, eigensolutions for calculating the linearized buckling response are discussed. The algorithms have been implemented and various experiences with the techniques are given. (16 refs.)

98770 Two families of finite deformations with constant strain invariants. W.-L.Yin (School of Engng. Sci. & Mech., Georgia Inst. of Technol., Atlanta, GA, USA).
Mech. Res. Commun. (GB), vol.10, no.3, p.127-32 (May-June 1983).
The celebrated problem of Ericksen concerning universal static solutions of homogeneous incompressible isotropic elastic bodies (see Z. Angew. Math. Phys., vol.5, p.466, 1954) has received a considerable amount of attention. The open questions posed by Ericksen concerns finite deformations with constant strain invariants. The author presents two new families of finite deformations with constant strain invariants. A distinctive feature of these deformations is that the three proper vectors of the deformation tensor (the principal directions of the finite strain) are anholonomic vector fields, i.e. these vector fields do not possess normal surfaces. Consequently, such deformations are associated with free thermal expansion or uniform growth of orthotropic bodies possessing a type of aeolotropy more general than what is usually called 'curvilinear aeolotropy'. (6 refs.)

98771 Exact solution for a class of integral equations of mixed boundary-value problems of elasticity and mathematical physics. V.N.Berkovich (All-Union Correspondence Inst. of Food Industry, Rostov-on-Don, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.914-15 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.327-30 (Nov. 1982).
The authors study the properties and the methods of construction of the exact solution of a class of integral equations that arise in mixed boundary-value problems of elasticity, acoustic, and diffraction theory for domains in the shape of a dihedral or a solid angle. The method used has been applied earlier in problems involving layer-shaped domains, and consists of looking for a solution in the form of a contour integral of functions that are regular on one side of the contour only. By a factorization method, the equation can be reduced to an exactly solvable system of equations for these functions. (8 refs.)

98772 Analysis of spherical shell with antisymmetric loading. I.S.Akhmed'yanov.
Sov. Aeronaut. (USA), vol.25, no.2, p.52-5 (1982). Translation of: *Izv. VUZ Aviats. Tekh. (USSR)*, vol.25, no.2, p.47-50 (1982).
The basic relations necessary for study of the stress-strain state of a spherical shell with action on the shell of a load symmetric relative to some meridional plane were presented by the author (1980). He proposes analogous relations which can be used to analyze the spherical shell with antisymmetric loading. (1 ref.)

03.40G Fluid dynamics: general mathematical aspects

(see also 47. Fluid dynamics)

98773 The initial boundary value problem for the flow of a barotropic viscous fluid, global in time. W.Fiszdon, W.M.Zajaczkowski (Inst. of Fundamental Tech. Res., Polish Acad. of Sci., Warsaw, Poland).
Appl. Anal. (GB), vol.15, no.1-4, p.91-114 (1983).
The existence and uniqueness of solutions, in Sobolev spaces, of the initial boundary value problem, global in time for the set of equations describing the flow of a barotropic viscous gas is investigated. A proof is deduced only for the case of inflow into a bounded domain valid for small initial and boundary conditions. (16 refs.)

98774 Strange attractors in fluid dynamics. J.Guckenheimer (Dept. of Math., Univ. of California, Santa Cruz, CA, USA).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.149-56
In 1971, Ruelle and Takens published a paper about the nature of turbulence. Their work motivated experimental physicists to study the transition to aperiodic flow in traditional laboratory experiments. Some of these experiments, beginning with those of Gollub and Swinney (1975), have produced results which appear to corroborate the basic ideas of Ruelle and Takens. However, there are fluid dynamicists who remain skeptical of these strange attractor models of turbulence. This paper is a discussion of these issues. The author proposes means by which the Ruelle-Takens theories can be tested directly and offer suggestions for alternative models of the transition to aperiodic flow in situations where the strange attractor models appear inappropriate. (15 refs.)

98775 Experimental aspects of the period doubling scenario. A.Libchaber (Groupe de Phys. des Solides, Ecole Normale Superieure, Paris, France).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.157-64
Rayleigh-Benard experiments in helium, water and mercury have shown that, in small and moderate Prandtl number fluids, the period doubling scenario is one of the possible routes to chaos. One usually analyses the experimental results in terms of a one dimensional mapping. In such a model, the mapping of the interval as a dynamical system, there is a strict hierarchy in the order of appearance of bifurcations as a function of the control parameter R. As R increases, a cascade of period doubling bifurcations (pitchfork bifurcations) evolves to its limit, for R_{∞}. Beyond this value, a chaotic state sets in, in which two remarkable phenomena occur. First, a reverse bifurcation sequence appears which shows period halving with increasing R. Second, within this region, a universal sequence of periodic states (tangent bifurcations) occurs. The author reviews the results of Rayleigh-Benard experiments in helium and mercury, showing that the whole scenario is experimentally observed. ~~But~~ all the experiments indicate also that a somewhat different scenario is very frequent, where the period doubling cascade is interrupted. It is also shown that within the framework of a 2D map this behaviour can be explained. The two-dimensional mapping used is the Henon one. (11 refs.)

03.40K Waves and wave propagation: general mathematical aspects

(see also 46.30M Mechanical and elastic waves, 43.20 General linear acoustics)

98776 On the general behavior of acceleration waves. V.V.Menon, V.D.Sharma (Inst. of Technol., Banaras Hindu Univ., Varanasi, India), A.Jeffrey.
Appl. Anal. (GB), vol.16, no.2, p.101-21 (1983).
A systematic study is made of the general behaviour of solutions to the Bernoulli equation which governs the evolution of acceleration waves in nonlinear systems. The theorems obtained contain all the known results and, in some instances, when specialized to the case of an existing theorem they provide a sharper result. Attention is drawn to the connection between the results obtained here for the Bernoulli equation, and the corresponding results for the propagation of a weak discontinuity in a general quasilinear hyperbolic system. (19 refs.)

98777 On the conditions for definiteness of energy and charge. M.Koiv (Inst. of Phys., Acad. of Sci., Tartu, USSR), R.K.Loide.
J. Phys. A (GB), vol.16, no.11, p.2353-61 (1 Aug. 1983).
The algebraic conditions of definiteness of energy and charge for the first-order wave equations are analysed and re-examined. The known definiteness conditions are applicable when there is no mass-spin degeneracy. A procedure is suggested for their use in the degenerate case, and is illustrated by application to an indefinite theory of particles of spin $^3/_2$ and $^1/_2$. (19 refs.)

98778 A hierarchy of coupled Korteweg-de Vries equations and the normalisation conditions of the Hilbert-Riemann problem. D.Levi (Istituto di Fisica, Univ. di Roma, Roma, Italy), S.Wojciechowski.
J. Phys. A (GB), vol.16, no.11, p.2423-32 (1 Aug. 1983).
The authors discuss the normalisation conditions of the Hilbert-Riemann Problem which is of importance for the construction of the ladder of soliton solutions. For a given spectral problem they provide the prescription for constructing the appropriate normalisation condition. All this is applied to a new hierarchy of coupled Korteweg-de Vries equations to find the soliton solution which displays some peculiar phenomena. (16 refs.)

98779 Connection between the existence of bisolitons for quadratic nonlinearities and a factorization of the associate linear operator. H.Cornille, A.Gervois (Div. de la Phys., CENS, Gif-sur-Yvette, France).
J. Math. Phys. (USA), vol.24, no.8, p.2042-55 (Aug. 1983).
In a first part the authors investigate the exponential type bisolitons of the class of equations $(\epsilon+L_q)K=(\epsilon+\Sigma_{i+j-1}{}^{i+j=q}\ a_{ij}\ \partial x(i)t(j)^{i+j})K=(\lambda+\mu\partial_x)K^2$ $(\epsilon\neq 0,\ \lambda\neq 0$ or $\epsilon=\lambda=0)$, which are rational solutions and they assume that their denominators have no coupling between the solitons. They have found that their existence requires a factorization property of either the operator $\epsilon+L_q$ for $\epsilon\neq 0$, $\lambda\neq 0$, $q\leq 3$ or L_q for $\epsilon=\lambda=0$, $q\leq 3$ with the exception of the Burgers equation. They find three kinds of nontrivial bisolitons: either those associated with the mixed nonlinearity $(\lambda+\mu\partial_x)K^2$ alone, or those common to the mixed nonlinearity and KK_x or those belonging to KK_x alone. In the second part they look at the two last types of bisolitons for $q>3$ and give a constructive method leading both to factorized linear operators and to the explicit determination of the bisolitons. They consider mainly $l_{q-2}(t)$ $(a\partial_t+b\partial_x+c\partial_{xx})G=(\partial_x G)^2$, $K=G_x$, with the linear operator factorizing the linear part of the Burgers equation, $l_{q-2}(t)$ is a differential operator in variable t only. The general G solution is a linear combination of log Δ and Δ^{-i}, $i=1,\ldots,q\text{-}2$ with $\Delta=1+\Sigma_1{}^2\ \exp(t+\gamma_i x)$. They determine different classes of solutions as well as the associated $l_{q-2}(t)$ operators. (8 refs.)

98780 On the solutions in elliptic functions of integrable nonlinear equations. V.Z.Enol'skii (Inst. for Theoretical Phys., Acad. of Sci., Kiev, Ukrainian SSR).
Phys. Lett. A (Netherlands), vol.96A, no.7, p.327-30 (18 July 1983).
A new solution in elliptic functions for the KdV equation is constructed using the method proposed by the Belokolos and the author (1982). (15 refs.)

98781 Rational solutions of the Korteweg-de Vries equation in wronskian form. J.J.C.Nimmo, N.C.Freeman (Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England).
Phys. Lett. A (Netherlands), vol.96A, no.9, p.443-6 (1 Aug. 1983).
The rational solutions of the Korteweg-de Vries equation are obtained as limits of the soliton solutions in wronskian form and these solutions are verified by direct substitution using a novel determinantal identity. (7 refs.)

98782 Classical scalar solitons in three space dimensions. J.Diaz-Alonso (Dept. d'Astrophys. Fondamentale, Meudon, France).
Phys. Rev. D (USA), vol.28, no.4, p.791-7 (15 Aug. 1983).
A systematic study of a class of covariant scalar field Lagrangians with derivative self-coupling is made. Methods are found which allow for the selection of classes of Lagrangian models with three-space-dimensional soliton solutions. These methods allow, in particular, for the elaboration of models with solutions which are finite-energy confining potentials. (17 refs.)

98783 The motion of solitons and breezers under the action of random forces. F.Kh.Abdullaev.
Sov. Phys.-Lebedev Inst. Rep. (USA), no.10, p.1-5 (1982). Translation of: *Sb. Kratk. Soobshch. Fiz. AN SSSR Fiz. Inst. P.N. Lebedeva*, no.10, p.3-7 (1982).
The author considers the motion of solitons of the sine-Gordon equation, the nonlinear Schrodinger equation, and also the motion of breezers in the field of random forces. The law of stochastic acceleration of solitons and breezers is found. (8 refs.)

98784 Generalised Lamb ansatz. E.D.Belokolos, V.Z.Enol'skii (Inst. of Theoretical Phys., Acad. of Sci., Ukrainian SSR).
Theor. & Math. Phys. (USA), vol.53, no.2, p.1120-7 (Nov. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.2, p.271-82 (Nov. 1982).
For the equation $\phi_{xx}-\phi_{tt}=\sin\phi$, a class of 2-phase solutions is constructed. They can be expressed in terms of Jacobi theta functions and contain the Lamb ansatz (1971) as a special case. An analogous class of solutions can also be obtained for other integrable nonlinear equations that admit solutions in terms of Riemann theta functions. (27 refs.)

98785 Random mechanical vibrations. W.Schiehlen (Inst. B fur Mech., Univ. Stuttgart, Stuttgart, Germany).
Z. Angew. Math. & Mech. (Germany), vol.63, no.4, p.T14-20 (1983). In German.
The excitation of vibrations in buildings or in a running vehicle by random process is considered. The intensity of the process of a given spectral density is deduced through measurements, while the non-white noise is derived from the white noise with a form filter. The simulation of real systems is carried out using the mechanics of continuum, finite-element, and many-body systems. Examples of computation for systems with distributed parameters and with discrete parameters are quoted. (46 refs.) *I.G.*

03.50 CLASSICAL FIELD THEORY

98786 A boundary element method for an exterior problem for three-dimensional Maxwell's equations. R.C.Maccamy (Carnegie-Mellon Univ., Pittsburgh, PA, USA), E.Stephan.
Appl. Anal. (GB), vol.16, no.2, p.141-63 (1983).
Contains an analysis of a Galerkin procedure for a system of integral equations arising in electromagnetic theory. The boundary value problem is that of Maxwell's equations in air in the exterior of a perfect conductor. The system of equations contains pseudodifferential operators on the obstacle surface. It is shown that the system is coercive and from this asymptotic convergence of Galerkin's method is established together with quasi-optimal estimates on convergence rates. (19 refs.)

98787 Some converse theorems in Newtonian field theory and their applications. D.Galletto (Istituto di Fisica Matematica 'J.-Louis Lagrange', Univ. di Torino, Torino, Italy).
Appl. Anal. (GB), vol.15, no.1-4, p.313-37 (1983).
Two converse theorems related to a family of homogeneous homothetic bodies and connected to the theory of the Newtonian field are proved. In both of them the function characterising the attraction is unknown and it is demonstrated that this function in the first theorem is given by the one characterising the Newtonian field and in the second theorem it is given by this latter function with the addition of a linear function of distance. A second unknown function appears in the second theorem and it is proved that it is a linear function of the volume of the bodies. Moreover, in both the theorems it is proved that the unknown shape of the bodies must be spherical. The conjecture is made that the two theorems are still true without the hypothesis that the unknown function characterising the attraction has a pole. Finally the second theorem is applied to the case of a finite homogeneous fluid. (15 refs.)

98788 Connection between the bremsstrahlung tip and direct radiative recombination: angular distributions and polarization correlations. I.J.Feng, I.B.Goldberg, Young Soon Kim, R.H.Pratt (Dept. of Phys. & Astron., Univ. of Pittsburgh, Pittsburgh, PA, USA).
Phys. Rev. A (USA), vol.28, no.2, p.609-14 (Aug. 1983).
The authors illustrate the possibility for calculation of bremsstrahlung tip angular distributions and polarization correlations from corresponding photoeffect results with an extension of the method for connecting bremsstrahlung tip and direct-radiative-recombination (DRR) cross sections developed by Lee and Pratt (1975). The agreement between results obtained with this method and results from the authors numerical partial-wave calculations is, in general, satisfactory. The authors note features of the distributions and correlations, and once again point out the inadequacies of the nonrelativistic dipole approximation for the evaluation of bremsstrahlung or DRR angular distributions. 03.65 QUANTUM THEORY; QUANTUM MECHANICS

(see also 05.30 Quantum statistical mechanics; for relativistic wave equations, see 11.10)

98789 Stationary states in proper time quantum mechanics. A.Herdegen (Inst. of Phys., Jagellonian Univ., Cracow, Poland).
Acta Phys. Pol. B (Poland), vol.B14, no.7, p.511-15 (July 1983).
The stationary states in proper time quantum mechanics are identified on the basis of physically essential stationarity property. The correspondence with the usual results is established. (2 refs.)

98790 Solution of Schrodinger equation including the two body correlations. M.Fabre de la Ripelle (Weizmann Inst. of Sci., Rehovot, Israel).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.14, p.1027-9 (18 April 1983). In French.
A solution of the Schrodinger equation including the two body correlations is proposed. This equation is transformed into an infinite set of coupled differential equations which can be truncated for the sake of computation. (6 refs.)

98791 Jost functions in the two-potential formalism. J.Dusek (Dept. of Phys., Inst. of Mech. & Electrical Engng., Plzen, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.7, p.745-56 (1983).
For two inhomogeneous Schrodinger equations playing an important role within the framework of the Gell-Mann-Goldberger two-potential formalism the author derives the integral equations for the off-shell solutions and gives the relations between the regular and Jost solutions. He defines the Jost functions fully off the energy shell. The obtained formulae give the possibility to extend the validity of various useful relations derived within the one-potential theory. (11 refs.)

98792 Reconstruction of singularities for solutions of Schrodinger's equation. S.Zelditch (Dept. of Math., Columbia Univ., New York, NY, USA).
Commun. Math. Phys. (Germany), vol.90, no.1, p.1-26 (1983).
Determines the behavior in time of singularities of solutions to some Schrodinger equations on R^n. The author assumes the Hamiltonians are of the form H_0+V, where $H_0=1/2\Delta+1/2\Sigma_{k=1}{}^n\omega_k{}^2x_k{}^2$, and where V is bounded and smooth with decaying derivatives. When all $\omega_k=0$, the kernel $k(t,x,y)$ of exp $(-itH)$ is smooth in x for every fixed (t,y). When all ω_l are equal but non-zero, the initial singularity 'reconstructs' at times $t=m\pi/\omega_l$ and positions $x=(-1)^m y$, just as if $V=0$; k is otherwise regular. In the general case, the singular support is shown to be contained in the union of the hyperplanes $\{x|x_{js}=(-1)^l js_{yjs}\}$, when $\omega_j t/\pi=l_j$ for $j=j_1,\ldots,j_r$. (14 refs.)

98793 On the basic states of one-dimensional disordered structures. L.N.Grenkova, S.A.Molcanov, J.N.Sudarev (Dept. of Math., Moscow State Univ., Moscow, USSR).
Commun. Math. Phys. (Germany), vol.90, no.1, p.101-23 (1983).
The authors study a limit probability distribution of the set of the first κ eigenvalues $\lambda_1(\mathscr{L})<\lambda_2(\mathscr{L})<\ldots<\lambda_\kappa(\mathscr{L})$ (with a fixed κ and $\mathscr{L}\rightarrow\infty$) of the boundary problem on the interval $[0,\mathscr{L}]$ $Hy=-{}^d/_{dt}a(t,\omega)^{dy}/_{dt}+q(t,\omega)y=\lambda y$, $y(0)=y(\mathscr{L})=0$, where $a(t,\omega)$, $q(t,\omega)$ are the random stationary processes. Particularly the question of the repulsion between the first eigenvalues (small energetic levels) is studied. It has been proved that in the 'divergent' case $(q(t,\omega)=0,\ a(t,\omega)\neq 0)$ levels repulsion exists. As for the 'potential' case $(a(t,\omega)\equiv 1, q(t,\omega)\neq 0)$ there is not any repulsion at all. This is one of the main differences between these two cases. (15 refs.)

98794 Quantum set theory. M.van Lambalgen (Dept. of Social Sci., Delft Univ. of Technol., Delft, Netherlands).
Delft Prog. Rep. (Netherlands), vol.8, no.1, p.17-24 (Jan. 1983).
Fusing quantum mechanics and set theory into a single 'quantum set theory' will probably evoke some astonishment, for several reasons. For one who recalls that set theory is supposed to be the foundation of mathematics, it may come as a surprise to learn that different (non-equivalent) set theories exist. And in the particular case, moreover, the alternative set theory is determined in some way by a physical theory, not by mathematical considerations, as would have seemed more appropriate. Before coming to the subject of quantum set theory proper, the author reviews those developments in fundamental research that lend the idea of a quantum set theory some plausibility. (7 refs.)

98795 Extended BRA-KET formalism in off-shell scattering theory illustrated by Coulomb-plus-short-range-potential scattering quantities in maximal-reduced form. W.van Haeringen (Dept. of Math. & Informatics, Delft Univ. of Technol., Delft, Netherlands).
Delft Prog. Rep. (Netherlands), vol.8, no.2, p.110-33 (June 1983).
The author discusses closed expressions for quantum-mechanical scattering quantities in a notation which is an extension of Dirac's bra-ket notation. For the special case of Coulomb plus rational separable potentials the author investigates explicit analytic expressions and defines a class of special functions which comprises all these expressions. The author derives many interesting relations and expressions in a so-called maximal-reduced form, which is useful for standardization and numerical calculations. (16 refs.)

98796 Dissipative quantum dynamics for systems periodic in time. N.Gisin (Dept. de Phys. Theorique, Univ. de Geneve, Geneve, Switzerland).
Found. Phys. (USA), vol.13, no.7, p.643-54 (July 1983).
A model of dissipative quantum dynamics (with a nonlinear friction term) is applied to systems periodic in time. The model is compared with the standard approaches based on the Floquet theorem. It is shown that for weak frictions the asymptotic states of the proposed dynamics are the periodic steady states which are usually postulated to be the states relevant for the statistical mechanics of time-periodic systems. A solution to the problem of nonuniqueness of the 'quasienergies' is proposed. The implication of a nonlinear evolution for Ludwig's axiomatization is briefly outlined. (23 refs.)

98797 The description of preparation and registration of physical systems and conventional probability theory. H.Neumann (Fachbereich Phys., Philipps-Univ., Marburg, Germany).
Found. Phys. (USA), vol.13, no.8, p.761-78 (Aug. 1983).
The connection of the structure of statistical selection procedures with measure theory is investigated. The methods of measure theory are applied in order to analyze a mathematical description of preparation and registration of physical systems that is used by G. Ludwig (1981, 1983) for a foundation of quantum mechanics. (10 refs.)

98798 Statistics of continuous trajectories in quantum mechanics: operation-valued stochastic processes. A.Barchielli, L.Lanz, G.M.Prosperi (Dipartimento di Fisica, Univ. di Milano, Milano, Italy).
Found. Phys. (USA), vol.13, no.8, p.779-812 (Aug. 1983).
A formalism for the description of continual observations of some quantities in the framework of quantum mechanics is reobtained and generalized, starting from a more axiomatic point of view. The statistics of the observations of continuous state trajectories is treated from the beginning as a generalized stochastic process in the sense of Gel'fand. An effect-valued measure and an operation-valued measure on the σ-algebra generated by the cylinder sets in the space of trajectories are introduced. The properties of the characteristic functional for the 'operational-valued stochastic process' are discussed and, through a suitable ansatz, a significant class of such processes is explicitly constructed. (21 refs.)

98799 Realism, operationalism, and quantum mechanics. D.Foulis, C.Piron, C.Randall (Univ. of Massachusetts, Amherst, MA, USA).
Found. Phys. (USA), vol.13, no.8, p.813-41 (Aug. 1983).
A comprehensive formal system is developed that amalgamates the operational and the realistic approaches to quantum mechanics. In this formalism, for example, a sharp distinction is made between events, operational propositions, and the properties of physical systems. (21 refs.)

98800 Properties and operational propositions in quantum mechanics. C.H.Randall, D.J.Foulis (Dept. of Maths. & Statistics, Univ. of Massachusetts, Amherst, MA, USA).
Found. Phys. (USA), vol.13, no.8, p.843-57 (Aug. 1983).
In orthodox quantum mechanics, it has virtually become the custom to identify properties of a physical system with operationally testable propositions about the system. The causes and consequences of this practice are explored mathematically. Among other things, it is found that such an identification imposes severe constraints on the admissible states of the physical system. (4 refs.)

98801 Physical uniformities on the state space of nonrelativistic quantum mechanics. R.Werner (Fachbereich Phys., Univ. Osnabruck, Osnabruck, Germany).
Found. Phys. (USA), vol.13, no.8, p.859-81 (Aug. 1983).
Uniformities describing the distinguishability of states and of observables are discussed in the context of general statistical theories and are shown to be related to distinguished subspaces of continuous observables and states, respectively. The usual formalism of quantum mechanics contains no such physical uniformity for states. Using recently developed tools of quantum harmonic analysis, a natural one-to-one correspondence between continuous subspaces of nonrelativistic quantum and classical mechanics is established, thus exhibiting a close interrelation between physical uniformities for quantum states and compactifications of phase space. General properties of the completions of the quantum state space with respect to these uniformities are discussed. (14 refs.)

98802 Qualitative theory of stochastic differential equations and quantum mechanics of disordered systems. G.Jona-Lasinio (Istituto di Fisica G.Marconi, Univ. di Roma, Roma, Italy).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.61-71 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Reviews some recent applications of ideas and methods from the qualitative theory of stochastic differential equations to problems in quantum mechanics. An interesting phenomenon revealed by this approach is the instability of tunneling states under small deformations of the potential. This result may be relevant for a deeper understanding of localization in random potentials. As a second application it is shown that the theory of small random perturbations allows a direct estimate of the asymptotic behaviour for large negative energies of the density of states in a white noise potential. In addition it provides a description of the local shape of the wave function in such a situation. (5 refs.)

98803 The quantum dynamics of three particles in hyperspherical coordinates. B.R.Johnson (Chem. & Phys. Lab., Aerospace Corp., El Segundo, CA, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.1916-25 (15 Aug. 1983).
A derivation of the quantum mechanical wave equation for the three body problem expressed in hyperspherical coordinates is presented. The coordinates, due to Smith and Whitten and later modified by Johnson [B.R Johnson, ibid., vol.73, p.5051 (1981)], are used in this study. The analysis is presented from a point of view that emphasizes the role of the three-dimensional configuration space that is associated with these coordinates. Three types of motion are analyzed: full three dimensional; motion restricted to a plane surface; and zero angular momentum motion. (32 refs.)

98804 Semigroups associated with analytic Schrodinger operators. C.van Winter (Dept. of Maths. & Phys., Univ. of Kentucky, Lexington, KY, USA).
J. Math. Anal. & Appl. (USA), vol.94, no.2, p.377-405 (July 1983).
If the potential in a two-particle system is the boundary value of an analytic function, the physical Hamiltonian $H(0)$ has an analytic continuation $H(\phi)$. The continuous spectrum of $H(\phi)$ consists of the half-line $Y(0,\phi)$ which runs from 0 to $\infty e^{2i\phi}$. Integrating along lines parallel to $Y(0,\phi)$, this paper examines the Fourier transform of the resolvent $R(\lambda,\phi)$. The integration path passing through $\pm i\epsilon e^{2i\phi}$ yields semigroups $\{U(t,\pm i\epsilon e^{2i\phi},\phi)\}$ ($t>0$ and $t<0$). Under the assumption that the potential is local and belongs to suitable $\mathfrak{L}^p$-spaces, it is shown that the semigroups tend to norm limits as ϵ tends to 0. The proof is based on the Paley-Wiener theorem for functions in a strip. It generalizes to multiparticle systems under conditions on $R(\lambda,\phi)$ that are to be verified with the help of the theory of smooth operators. (22 refs.)

98805 Groups generated by analytic Schrodinger operators. C.van Winter (Dept. of Maths. & Phys., Univ. of Kentucky, Lexington, KY, USA).
J. Math. Anal. & Appl. (USA), vol.94, no.2, p.406-34 (July 1983).
If the potential in a two-particle system is the boundary value of an analytic function, the physical Hamiltonian $H(0)$ has an analytic continuation $H(\phi)$ which is not normal. In case the potential is local and belongs to suitable $\mathfrak{L}^p$-spaces, there is a bounded operator $P(0,\phi)$ projecting onto the continuous subspace of $H(\phi)$. This paper shows that $P(0,\phi)H(\phi)e^{-2i\phi}$ generates a strongly differentiable group. It is proved that $P(0,\phi)H(\phi)$ is spectral, and details of the spectral projection operators are presented. The reasoning is based on the Paley-Wiener theorem for functions in a strip. It applies to larger systems provided the resolvent of the multiparticle operator $H(\phi)$ satisfies certain regularity conditions that come from the theory of smooth operators. There are no smallness conditions on the potential. (13 refs.)

98806 A reformulation of Schrodinger and Dirac equations in terms of observable local densities and electromagnetic fields: a step towards a new interpretation of quantum mechanics?. J.de Clizeaux (SPHT-CEN, Gif-sur-Yvette, France).
J. Phys. (France), vol.44, no.8, p.885-908 (Aug. 1983).
It is shown that the Schrodinger equation, the 3-dimensional Dirac equation and the 4-dimensional Dirac equation can be transformed so as to eliminite all phase and gauge effects. Real local densities are defined and it is shown that these tensors obey real 'probabilistic equations' which are equivalent to the equations of quantum mechanics. These new equations, which are explicitly constructed, involve only local densities and the external electromagnetic field. New boundary conditions are also derived. The Aharonov-Bohm experiment is reinterpreted in the framework of this new formalism. (17 refs.)

98807 Probabilistic solution of Pauli type equations. G.F.De Angelis (Istituto di Fisica, Univ. di Salerno, Salerno, Italy), G.Jona-Lasinio, M.Sirugue.
J. Phys. A (GB), vol.16, no.11, p.2433-44 (1 Aug. 1983).
Extends the Feynman-Kac formula to the case of imaginary time Schrodinger equations (heat equations) for multicomponent wavefunctions. The approach covers in particular the usual Pauli equation for a spin-$^1/_2$ particle in an arbitrary magnetic field. The formula contains, besides the expectation with respect to a Wiener process in ordinary space, an expectation with respect to a jump process over the discrete indices describing the internal degrees of freedom. To illustrate the method the authors evaluate the formula in some special cases and they derive also various inequalities. A detailed comparison is made with a recent work by Gaveau and Vauthier (1981). (9 refs.)

98808 Fast eigenvalue algorithm for central potentials. R.E.Crandall (Dept. of Phys., Reed Coll., Portland, OR, USA).
J. Phys. A (GB), vol.16, no.12, p.L395-9 (21 Aug. 1983).
An algorithm is described that seeks out Schrodinger eigenvalues E_{nl} for a given central potential $V(r)$. The algorithm has, in principle, arbitrary precision. A particular implementation has absolute error $|E-E_{nl}|$ decreasing as T^{-3}, where T is machine computing time. The method is tested on the central Gaussian potential $V(r)=-A\exp(-\lambda r^2)$ of recent interest. (8 refs.)

98809 The local geometric asymptotics of continuum eigenfunction expansions. III. Boundary effects and coefficient singularities. S.A.Fulling (Dept. of Math., Texas A&M Univ., College Station, TX, USA).
J. Phys. A (GB), vol.16, no.12, p.2615-31 (21 Aug. 1983).
For pt.II see SIAM J. Math. Anal., vol.14, no.4, p.780-95 (1983). The effect of a boundary condition on the spectral density of a differential operator in one dimension is computed directly from the asymptotic behaviour of the eigenfunctions. From the properly normalised eigenfunction expansion, the contribution of the boundary to the diagonal value of the heat kernel at a point is obtained, and some properties of the special functions arising thereby are derived. A discontinuity, or other singularity, in the coefficient function of the operator is shown to have spectral effects quite analogous to those of a boundary, and the additional effects due to the coexistence of a boundary and a discontinuity are investigated to lowest order. (28 refs.)

98810 On the stationary phase evaluation of path integrals in the coherent states representation. Y.Weissman (Dept. of Chem., Univ. of California, Berkeley, CA, USA).
J. Phys. A (GB), vol.16, no.12, p.2693-701 (21 Aug. 1983).
The extremal paths that arise in the stationary phase evaluation of coherent state path integrals do not seem to have a simple physical interpretation, in contrast to the extremal paths that occur in the conventional path integrals. On the other hand, a recently derived semiclassical formula for the coherent state propagator involves a path that is determined in exactly the same manner as the extremal paths of the conventional path integrals. Since both the semiclassical and the stationary phase analyses yield asymptotic ($\hbar\to0$) approximations, the stationary phase and the semiclassical expressions for the propagator should be identical. The author presents a simple and direct proof that, in spite of the apparent differences, this is indeed the case. The simplification in the semiclassical formula is due to the utilisation of an appropriate set of canonical variables to describe the classical dynamics. In order to illustrate the usefulness of the semiclassical formula they present an application to the problem of the degenerate parametric amplifier, which had been treated before by operator ordering and path integral methods. The semiclassical approach has a simple classical interpretation that is absent in the alternative treatments. (29 refs.)

98811 On locality, correlation and hidden variables. D.E.Liddy (Dept. of Appl. Math., Univ. of Sydney, Sydney, NSW, Australia).
J. Phys. A (GB), vol.16, no.12, p.2703-8 (21 Aug. 1983).
Locality conditions for hidden-variables descriptions of the Bohm-EPR thought experiment are shown to be unnecessary as the underlying structure is already local. An objective, local hidden-variables theory is given. (11 refs.)

98812 On the specific features of the theory of scattering of two quantum particles by a third massive particle. A.M.Popova, Yu.V.Popov (Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR).
J. Phys. A (GB), vol.16, no.12, p.2743-9 (21 Aug. 1983).
The behaviour of the solution of the Faddeev equations for the three-body problem if one particle mass goes to infinity has been investigated. It is shown that this solution has no continuous passage to the limit considered. It is also shown that for obtaining the required amplitude of scattering of two light particles by an infinitely heavy particle it is necesssary to rearrange the Faddeev equations and to reduce them to the equations of the problem of two particles in a field. (6 refs.)

98813 The analytically continued S matrix for potentials defined as a sum of exponentials. II. The multichannel problem. H.D.Meyer (Phys.-Chem. Inst., Univ. Heidelberg, Heidelberg, Germany).
J. Phys. B (GB), vol.16, no.15, p.2785-800 (14 Aug. 1983).
For pt.I see ibid., vol.16, p.2265 (1983). A method for computing the multichannel S matrix at real and complex energies is proposed. This method is a generalization of the one given previously for single-channel problems. It requires a potential matrix of the form $V_{n,n'}(r)=\Sigma_{j=1}{}^{\infty}U_{n,n'}{}^{(j)}(\alpha)\exp(-\ j\alpha r)$. The algorithm to determine the Jost matrix (and hence the S matrix) is simple and fast. The feasibility and usefulness of the method is demonstrated by applying it to model problems on electronic and vibrational predissociation. (10 refs.)

98814 Symmetry and generating relations for Clebsch-Gordan coefficients arising from automorphisms. R.Dirl (Inst. fur Theoretische Phys., Tech. Univ. Wien, Wien, Austria).
J. Math. Phys. (USA), vol.24, no.8, p.1935-44 (Aug. 1983).
A new class of symmetry and generating relations for Clebsch-Gordan coefficients is derived. It is associated with certain elements of the full automorphism group. The approach turns out to be useful for an efficient computation of Clebsch-Gordan coefficients. (13 refs.)

98815 On a new class of gradient formulas in the angular momentum theory. A.W.Niukkanen (Vernadsky Inst. of Geochem. & Analytical Chem., Acad. of Sci., Moscow, USSR).
J. Math. Phys. (USA), vol.24, no.8, p.1989-91 (Aug. 1983).
Recently B.F. Bayman (1978) has derived for formula for $\mathcal{Y}_{lm}(\nabla)\phi(r)\mathcal{Y}_{LM}(\mathrm{r})$, where $\mathcal{Y}_{lm}(\mathrm{r})$ is a solid spherical harmonic, in terms of the derivatives of the function $\phi(\mathrm{r})$ by the scalar parameter r. This result is clarified and essentially generalized for the case of the tensor product $\{\mathcal{Y}_l{}^m(\nabla)\otimes\phi(r)\mathcal{Y}_L(\mathrm{r})\}_{\lambda\mu}$, where $\mathcal{Y}_{lm}{}^m(\nabla)=\Delta^n\mathcal{Y}_{lm}(\nabla)$. Applications to the Taylor series in the three-dimensional Euclidean space, as well as some other expansions, are discussed briefly. (13 refs.)

98816 On the higher orders of hyperspherical harmonics. E.Arribas, J.Navarro (Dept. de Fisica Teorica, Facultad de Ciencias Fisicas, Burjassot-Valencia, Spain), M.Fabre de la Ripelle.
J. Math. Phys. (USA), vol.24, no.8, p.1992-6 (Aug. 1983).
The authors suggest a procedure to evaluate matrix elements between hyperspherical harmonics of any order. The method is based on the hyperspherical expansion of a Slater determinant constructed with oscillator wavefunctions. Explicit formulae are given for all matrix elements up to order L_m+2. (10 refs.)

98817 On a new hierarchy of Hamiltonian soliton equations. M.Boiti, C.Laddomada, F.Pempinelli, G.Z.Tu (Dipartimento di Fisica, Univ. di Lecce, Lecce, Italy).
J. Math. Phys. (USA), vol.24, no.8, p.2035-41 (Aug. 1983).
A method is suggested for studying the Hamiltonian structure of the nonlinear partial differential equations that can be solved by the use of the spectral transform (soliton equations). The method is applied to a new hierarchy of $N+1$ coupled partial differential equations related to a Schrodinger-like spectral problem. It is shown that these soliton equations are integrable Hamiltonian equations with commuting flows. For $N=1$ and $N=2$ a Miura-like transformation is computed and the corresponding modified equations are explicitly given. (17 refs.)

98818 The rotating harmonic oscillator eigenvalue problem. I. Continued fractions and analytic continuation. D.Masson (Dept. of Maths., Univ. of Toronto, Toronto, Ontario, Canada).
J. Math. Phys. (USA), vol.24, no.8, p.2074-88 (Aug. 1983).
The continued fraction approach to the solution of the rotating harmonic oscillator eigenvalue problem is examined in detail. It is shown how one may obtain eigenvalue information only from an analytic continuation of the continued fraction accomplished with the aid of modified approximants. (19 refs.)

98819 The rotating harmonic oscillator eigenvalue problem. II. Analytic perturbation theory. D.Masson (Dept. of Math., Univ. of Toronto, Toronto, Ontario, Canada).
J. Math. Phys. (USA), vol.24, no.8, p.2089-94 (Aug. 1983).
For pt.I see ibid., vol.24, no.8, p.2074-88 (1983). The theory of self-adjoint analytic families is applied to the rotating harmonic oscillator Hamiltonian in $L^2(0,\infty)$ to obtain weak and strong coupling expansions of the eigenvalues. Various estimates on the radius of convergence of the weak coupling expansion are obtained. The strong coupling expansion is shown to be an asymp-

totic series which, with the neglect of exponentially small terms, is expressible in terms of a simple formal perturbation of the ordinary harmonic oscillator Hamiltonian in $L^2(-\infty,\infty)$. (13 refs.)

98820 Measure for measure: covariant skeletonizations of phase space path integrals for systems moving on Riemannian manifolds. K.Kuchar (Dept. of Phys., Univ. of Utah, Salt Lake City, UT, USA).
J. Math. Phys. (USA), vol.24, no.8, p.2122-41 (Aug. 1983).
The author defines phase space path integrals for systems moving on a Riemannian manifold and subject to a generalized potential by a skeletonization procedure which is manifestly covariant under point transformations. The author achieves this goal by introducing a natural analog $S(x'',t''|x',p',t')$ of the Hamiltonian principal function with phase space initial data. One class of such functions is based on the parallel transport of momentum, a second class is obtained by a modification of the first class, and a third class is based on the geodesic deviation transport of momentum. The third class of principal functions is geometrically privileged. The author skeletonizes the canonical action integral by replacing it by a manifestly covariant chain of phase space principal functions. Different functions lead to the same functional as the author infinitely refines the skeletonization along a smooth path. The phase space path integral is always taken with the natural Liouville measure, but the integration over momentum variables brings down a nontrivial measure to the remaining configuration space path integral. Because nondifferentiable rather than smooth paths dominate the path integral, different phase space principal functions generate different configuration space path measures. Such measures lead to quantum propagators which satisfy Schrodinger's equations with all possible scalar curvature terms $\sim\hbar^2R$. The geometrically privileged phase space principal function (based on the geodesic deviation transport) leads to the Schrodinger equation without any curvature term. (15 refs.)

98821 A description of virtual scattering in the rigged Hilbert space formulation of quantum mechanics. M.Gadella (Facultad de Ciencias, Santander, Spain).
J. Math. Phys. (USA), vol.24, no.8, p.2142-5 (Aug. 1983).
The author defines a pair of Gel'fand triplets $\Phi_i\subset\mathcal{H}_i\subset\Phi'_i, i=1,2$, where the linear spaces Φ_i are formed by suitably chosen entire analytic functions on the Riemann surface associated to the transformation $\omega=z^2$. Virtual scattering states are well defined as pairs of functionals, respectively, in Φ'_1 and Φ'_2. (22 refs.)

98822 The Gel'fand-Levitan equation on a finite interval. H.E.Moses (Center for Atmospheric Res., Univ. of Lowell, Lowell, MA, USA), R.T.Prosser.
J. Math. Phys. (USA), vol.24, no.8, p.2146-51 (Aug. 1983).
It is shown here, by using the methods of Gel'fand and Levitan, that one may alter in certain ways the spectral data (eigenvalues and normalizations) of the Schrodinger equation for a finite interval, by suitably altering the potential. These alterations include the deletion and insertion of a finite number of eigenvalues and/or renormalization of a finite number of eigenfunctions. The deletion of an eigenvalue requires the addition of a singular potential, while the insertion of an eigenvalue requires an adjustment of the boundary conditions resulting in a non-self-adjoint operator. Similarly the insertion of a continuous spectrum leads to non-self-adjoint operators. The non-self-adjoint operators have, nevertheless, complete sets of eigenfunctions and a corresponding spectral decomposition in a suitable subspace. (5 refs.)

98823 Inverse scattering by a local impurity in a periodic potential in one dimension. R.G.Newton (Phys. Dept., Indiana Univ., Bloomington, IN, USA).
J. Math. Phys. (USA), vol.24, no.8, p.2152-62 (Aug. 1983).
Hill's equation, modified by a potential that vanishes as $x\rightarrow\pm\infty$, is considered. The direct scattering problem is studied; analytic and asymptotic properties of solutions of Hill's equation as well as of solutions of the modified equation are established. A new version of Levinson's theorem is proved. The inverse scattering problem is solved by means of a Marchenko-like equation. (20 refs.)

98824 Transmission through a system of potential barriers. I. Transmission coefficient. O.Dammert (Inst. of Theoretical Phys., Univ. of Uppsala, Uppsala, Sweden).
J. Math. Phys. (USA), vol.24, no.8, p.2163-75 (Aug. 1983).
The transmission coefficient for a one-dimensional system of N potential barriers of general shapes (unequal or equal) is expressed exactly, by means of the phase-integral method of N. Froman and P.O. Froman (1965, 1966, 1970, 1974), in terms of quantities characterizing the separate barriers and wells of the system. The exact formula, being of interest for further rigorous studies of transmission properties, can for evaluation readily be converted into a useful approximate formula by insertion of available phase-integral expressions (of an arbitrary order) for the characteristic quantities mentioned above. Error estimates are given. The sub- and superbarrier cases are treated in a unified way. Some key facts about the phase-integral method are given. (33 refs.)

98825 Second quantization in a box with a moving wall. M.Razavy (Dept. of Phys., Univ. of Alberta, Edmonton, Alberta, Canada).
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.13, p.449-53 (30 July 1983).
For a system of noninteracting bosons occupying a box with a moving wall, an effective Hamiltonian density is found and the equations of motion for creation and annihilation operators are obtained. (7 refs.)

98826 Comments on microscopic mechanics, generalizations of classical mechanics and Planck's oscillators. M.Yussouff (Internat. Centre for Theoretical Phys., Trieste, Italy).
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.13, p.454-8 (30 July 1983).
The new microscopic mechanics removes the dichotomy of physics into classical and quantum phenomena. Its physical picture and connections with generalizations of classical mechanics are discussed. It gives a new meaning to Bohr's frequency relation and Planck's oscillators. (11 refs.)

98827 Are photons essential?. C.Cohen-Tannoudji (Coll. de France, Paris, France).
Phys. Bl. (Germany), vol.39, no.7, p.198-9 (July 1983). In German.
The author discusses to what extent a quantum theory or radiation, using photons, vacuum fluctuations, field commutation relations etc. is essential at low energy (optical domain). (15 refs.)

98828 Bell's inequality and the uncertainty principle. K.M.Hartmann (Sektion Phys., Univ. Munchen, Garching, Germany).
Phys. Lett. A (Netherlands), vol.97A, no.1-2, p.15-17 (8 Aug. 1983).
Based on this definition of 'physical reality', Bell and others have derived certain inequalities between the probabilities for measuring the polarizations of the two spin 1/2 particles along different spatial directions. For certain orientations of the polarizers these inequalities are claimed to be in conflict with the predictions of quantum mechanics. The authors show that, provided the spins of both particles are in principle measurable along all relevant directions, these inequalities are satisfied in quantum mechanics. If however, the spin along one of these directions is in principle unmeasurable these inequalities may be violated in quantum mechanics. (8 refs.)

98829 Significance of a certain restriction in the derivation of Bell's inequality from quantum mechanics. Y.Koc (Bogazici Univ., Istanbul, Turkey).
Phys. Lett. A (Netherlands), vol.97A, no.1-2, p.18-20 (8 Aug. 1983).
It is shown that Bell's inequality can be derived from quantum mechanics if a certain restriction holds on the expectation values of the product of the spins of two correlated particles prepared in the singlet state. Significance of this restriction is discussed. (6 refs.)

98830 Distance between quantum states, statistical inference and the projection postulate. D.Dieks, P.Veltkamp (Fysisch Lab., Rijksuniv. Utrecht, Utrecht, Netherlands).
Phys. Lett. A (Netherlands), vol.97A, no.1-2, p.24-8 (8 Aug. 1983).
The authors discuss the following problem of statistical inference in quantum theory: a statistical operator W_0 is given a priori; one is then asked to determine the best choice W_1 for a statistical operator a posteriori, i.e. after a number of measurement results on the physical system in question have become available. They propose a solution to this problem which minimizes a certain distance between W_0 and W_1 and compare this solution with similar proposals recently made in the literature. They also discuss an alleged connection between statistical inference and the so-called 'projection postulate'. (9 refs.)

98831 Comment on 'Test of the gauge-invariant formulation of quantum mechanics'. S.T.Epstein (Dept. of Phys., Univ. of Wisconsin, Madison, WI, USA).
Phys. Lett. A (Netherlands), vol.97A, no.1-2, p.29 (8 Aug. 1983).
For original paper see K.-H. Yang, ibid., vol.94A, p.259 (1983). It is shown that the gauge-invariant formulation is equivalent to the conventional formulation and that the proposed test tests only the relative accuracy of the rotating-wave approximation within the two formulations. (1 ref.)

98832 New results for scattering on the line. D.Bolle (Inst. voor Theoretische Fysica, Univ. Leuven, Leuven, Belgium), F.Gesztesy, S.F.J.Wilk.
Phys. Lett. A (Netherlands), vol.97A, no.1-2, p.30-4 (8 Aug. 1983).
Low-energy scattering for Schrodinger Hamiltonians on the line is discussed, taking into account explicitly the possibility of zero-energy resonances. Analytic expansion are presented for the reflection and transmission coefficient, the phase shift and the resolvent difference. Furthermore, a set of sum rules is obtained. In particular, it is found that Levinson's theorem completely changes its structure in comparison with its three-dimensional analogue. (21 refs.)

98833 On the nodal behaviour of eigenfunctions. H.J.Korsch (Fachbereich Phys., Univ. Kaiserslautern, Kaiserslautern, Germany).
Phys. Lett. A (Netherlands), vol.97A, no.3, p.77-80 (15 Aug. 1983).
The generic behaviour of the nodal pattern of the eigenfunctions of the Schrodinger equation depending on parameters is discussed. Numerical examples are presented for the case of a hard-walled parallelogram. (20 refs.)

98834 A note on 'Painleve property of anharmonic systems with an external periodic field'. T.C.Bountis (Dept. of Math. & Computer Sci., Clarkson Coll., Potsdam, NY, USA).
Phys. Lett. A (Netherlands), vol.97A, no.3, p.85-6 (15 Aug. 1983).
It is shown, contrary to what was claimed in ibid., vol.95A, p.269 (1983), that the Van der Pol equation does not possess the Painleve property. It has solutions with movable branch points in the complex time plane, and is therefore, most likely, a nonintegrable dynamical system. (9 refs.)

98835 Comment on 'Painleve property of anharmonic systems with an external periodic field'. A.Ramani (Centre de Phys. Theorique, Ecole Polytech., Palaiseau, France), B.Dorizzi, B.Grammaticos.
Phys. Lett. A (Netherlands), vol.97A, no.3, p.87 (15 Aug. 1983).
Shows that the result of Steeb and Kunick (see ibid., vol.95A, p.269, 1983) concerning the singularity structure of the Van der Pot equation is false. (3 refs.)

98836 On the Einstein-Podolsky-Rosen argument: its recent critique and its meaning. N.S.Todorov (Low Temperature Dept., Inst. of Solid State Phys., Sofia, Bulgaria).
Phys. Lett. A (Netherlands), vol.97A, no.3, p.91-4 (15 Aug. 1983).
There is good physics in a recent paper of Page (see ibid., vol.91A, p.57, 1982) on the EPR paradox (1935). This physics, however, does not lead to the inference that the EPR argument is essentially invalid. (10 refs.)

98837 The quantum mechanical Landau equation. A.K.Macpherson (Packard Lab., Lehigh Univ., Bethlehem, PA, USA).
Proc. R. Soc. London Ser. A (GB), vol.388, no.1795, p.393-400 (8 Aug. 1983).
The significance of quantum mechanical effects on the short time development of the Landau equation is examined. The analysis is undertaken using the density diagram technique of Prigogine and Balescu. Owing to the apparent similarity that exists between the density diagrams and the more familiar Feynmann diagrams derived from generalized Green functions a short discussion of both techniques is presented. The solution is undertaken for small h/m and does not necessarily apply to electrons. It is found that quantum mechanical effects may become significant at a number density around 10^{14}, which is the lower bound in density that an earlier analysis suggested. Non-Markovian effects may be significant. (6 refs.)

98838 Do attractive scattering potentials concentrate particles at the origin in one, two and three dimensions? I. Potentials finite at the origin. G.Barton (School of Math. & Phys. Sci., Univ. of Sussex, Brighton, England).
Proc. R. Soc. London Ser. A (GB), vol.388, no.1795, p.401-18 (8 Aug. 1983).
Paradoxically, in beta decay, for instance, the final-state Coulomb forces pulling the electron inwards accelerate to the emission. Quantum mechanics (q.m.) makes the rate proportional to $\alpha\equiv\rho_0/\rho_\infty$; $\rho_{0,\infty}$ (and $v_{0,\infty}$) are the particle densities (and speeds) at $r=0$ and far upstream in the scattering state which describes the electron. Hence, as regards the effects of final-state interactions, one must base one's physical intuition on this ratio α. It is shown that according to (non-relativistic) classical mechanics, if the origin is accessible, then any central potential $U(r)$ where $v_0<\infty$ (i.e. where $U(0)>-\infty$) gives in 1, 2 and 3 dimensions, $\alpha_1=v_\infty/v_0$, $\alpha_2=1$, $\alpha_3=v_0/v_\infty$; the remaining course of $U(r)$ is irrelevant to α. The same results hold also in q.m. in the semiclassical regime, i.e. in the WKB approximation which for such potentials becomes valid at high wavenumbers; in 2D it needs rather careful formulation, and in 3D one must avoid the Langer modification. (The WKB results apply even if dU/dr diverges at $r=0$, provided $U(0)$ remains finite; these cases are covered by a simple extension of the argument.) The square-well and exponential potentials are discussed as examples. (13 refs.)

98839 Do attractive scattering potentials concentrate particles at the origin in one, two and three dimensions? II. Potentials diverging as $-C/r^q$. G.Barton (School of Math. & Phys. Sci., Univ. of Sussex, Brighton, England).

Proc. R. Soc. London Ser. A (GB), vol.388, no.1795, p.419-44 (8 Aug. 1983).

For pt.I see ibid., vol.388, p.401-418 (1983). In classical mechanics (c.m.) and near the semi-classical limit $\hbar \rightarrow 0$ of quantum mechanics (s.c.l.) the enhancement factors $\alpha \equiv \rho_0/\rho_\infty$ are found for scattering by attractive central potentials $U(r)$; here $\rho_{0,\infty}$ (and $v_{0,\infty}$) are the particle densities (and speeds) at the origin and far upstream in the incident beam. For finite potentials ($U(0) > -\infty$), and when there are no turning points, the preceding paper found both in c.m., and near the s.c.l. (which then covers high v_∞), $\alpha_1 = v_\infty/v_0$, $\alpha_2 = 1$, $\alpha_3 = v_0/v_\infty$ respectively in one dimension (1D), 2D and 3D. The argument is now extended to potentials (still without turning points), where $U(r \rightarrow 0) \sim -C/r^q$, with $0<q<1$ in 1D (where $r \equiv |x|$), and $0<q<2$ in 2D and 3D, since only for such q can classical trajectories and quantum wavefunctions be defined unambiguously. (3 refs.)

98840 Do attractive scattering potentials concentrate particles at the origin in one, two and three dimensions? III. High energies in quantum mechanics. G.Barton (School of Math. & Phys. Sci., Univ. of Sussex, Brighton, England).

Proc. R. Soc. London Ser. A (GB), vol.388, no.1795, p.445-56 (8 Aug. 1983).

For pt.II see ibid., vol.388, p.419-444 (1983). The enhancement factor $\alpha_D \equiv 1 + \delta\alpha_D$ is defined (in D dimensions) as the ratio of the particle density at the origin to the density far upstream in the incident beam. At high incident momentum p (and for regular potentials) the first Born approximation is known to be adequate in 3D and 1D, and is assumed to be adequate also in 2D; it entails $\delta\alpha_1 = -\delta\alpha_3$ if $U(r)$ in 3D equals $U(x)$ in 1D when $r = x$. For central potentials $U(r)$ with $U(0)$, finite, previous work implies $\delta\alpha_3 \sim -\delta\alpha_1 \sim -mU(0)/p^2$, and $\delta\alpha_2 = 0$, to the same order $\hbar^0$. It is shown that if $U(r \rightarrow 0) \sim U(0) + rU'(0) + \ldots$, then $\delta\alpha_2 \sim (2mU'(0)\hbar/p^3)\ (\pi/{}^{1}/_{16})$, the value of $U(0)$ being irrelevant. If $U(r \rightarrow 0) \sim -C/r^q$, with $0<q<2$, then $\delta\alpha_3 \sim -\delta\alpha_1 \sim (2mC/\hbar^q p^{2-q})\pi^{1/2}\Gamma(1-{}^{1}/_{2}q)/2\Gamma({}^{1}/_{2}+{}^{1}/_{2}q)$; and, with $-1<q<2$, $\delta\alpha_2 \sim (2mC/\hbar^q p^{2-q})\pi^{1/2}\Gamma^2(1-{}^{1}/_{2}q)2\Gamma({}^{1}/_{2}q)\Gamma({}^{3}/_{2}-{}^{1}/_{2}q)$. The only mathematics needed in 3D and 1D is the standard asymptotic estimation of Fourier integrals; but in 2D one needs to develop corresponding methods for integrals where the sine or cosine has been replaced by a product $J_0 Y_0$ of two Bessel functions. (10 refs.)

98841 Hydrodynamical formalism of quantum mechanics and Aharonov-Bohm effect. T.Takabayasi (Dept. of Phys., Nagoya Univ., Nagoya, Japan).

Prog. Theor. Phys. (Japan), vol.69, no.5, p.1323-44 (May 1983).

Hydrodynamical formalism of quantum mechanics is revisited for a particle under external electromagnetic field, with detailed explanations as to its subtle aspects such as the role of singular vortex lines with quantized circulation. The theory is applied to several problems where a charged particle moves under certain new configurations of external magnetic field, which are suitable to provide examples of Aharonov-Bohm effect in different situations. A remarkable consequence is given about the flow in the case of string magnetic field and is employed to obtain solutions explicitly for the movement under the field of a circular magnetic string. (11 refs.)

98842 Chaotic response of a self-interacting pseudo-spin model. M.Inoue, H.Koga (Dept. of Phys., Kagoshima Univ., Kagoshima, Japan).

Prog. Theor. Phys. (Japan), vol.69, no.5, p.1403-15 (May 1983).

A new model for a conservative semi-quantum system is presented to study quantum aspects of chaotic behavior. The model is made up of a pseudo-spin which interacts with an external field and the reaction field of the polarization of the pseudo-spin. The reaction field is superimposed upon the external field in the equations of motion and it brings nonlinear terms. Two isolating integrals, whose intersection curve gives an orbit, are obtained analytically in a static external field case, and phase plane plots are drawn using the integrals. The phase plane plots have three elliptic fixed points and one hyperbolic fixed point for a strong reaction field case and it has two elliptic ones and no hyperbolic one for a weak reaction field case. Only one single finite separatrix emanates from the hyperbolic fixed point in the strong reaction field case. Chaotic motion is observed in a periodic external field case, and Poincare mappings, Lyapunov exponents and power spectra of the polarization are calculated with the aid of computer simulations. The spectrum of 1-dimensional Lyapunov exponents takes a hyperbolic type (+, 0, −), namely the model has C-system like property. (16 refs.)

98843 Large-N quantum mechanics and classical limits. L.G.Yaffe (Princeton Univ., Princeton, NJ, USA).

Phys. Today (USA), vol.36, no.8, p.50-7 (Aug. 1983).

Discusses a particular approximation scheme, commonly referred to as the method of 'large-N expansions'. The method is based on the possibly surprising fact that increasing the number of degrees of freedom can simplify the analysis of a theory. Specifically, if N is some measure of the number of degrees of freedom, or dimensionality, of a theory, then the theory may have a natural large-N generalization that one can solve explicitly in the limit $N \rightarrow \infty$. Such a solution allows one to calculate physical observables in the original finite-N theory by expanding them systematically in powers of $1/N$. This approach turns out to be applicable to a wide class of theories, including many for which conventional approximation techniques are inapplicable. (10 refs.)

98844 Liouvillian Green's functions and self-energies for energy-shift and decay phenomena. M.D.Girardeau (Dept. of Phys. & Inst. of Chem. Phys. & Theoretical Sci., Univ. of Oregon, Eugene, OR, USA).

Phys. Rev. A (USA), vol.28, no.2, p.1056-71 (Aug. 1983).

Green's functions and transition self-energies of dissipative quantum-mechanical manybody systems are formulated in terms of operator-basis expansions of Heisenberg equations of motion in Liouville space. Matrix elements of the Liouvillian with respect to arbitrary nonorthogonal operator bases play a primary role in the analysis. The self-energies are expressed as functionals of initial statistical ensemble averages which are presumed known and not restricted to systems at or near equilibrium; this provides a first-principles approach to use of spectral line shapes as a diagnostic of the nonequilibrium state of a dense gas, plasma, and/or radiation field. A perturbation expansion of the self-energy is derived and the general term is interpreted in terms of a subtraction of reducible parts. A separation into resonant and nonresonant contributions plays a crucial role in the analysis. The first-order resonant contribution yields a generalized statistical Hartee-Fock approximation, whereas the second-order contribution generalizes the Weisskopf-Wigner theory of decaying states to include thermal and, more generally, nonequilibrium environmental effects on transition-energy shifts and widths. Off-diagonal contributions to the self-energy are shown to be essential for inclusion of environmental contributions. (31 refs.)

98845 Transmission in a self-similar Schrodinger equation. Y.Avron (Dept. of Phys., California Inst. of Technol., Pasadena, CA, USA).

Phys. Rev. B (USA), vol.28, no.4, p.2225 (15 Aug. 1983).

The transmission in certain self-similar Schrodinger equations may be a pathological function of the energy. (2 refs.)

98846 Projector fields in formulation of coupled dynamics. I. Lagrangian dynamics. C.M.Do Amaral, P.Pitanga (Inst. de Fisica, Univ. Federal do Rio de Janeiro, Rio de Janeiro, Brazil).

Rev. Bras. Fis. (Brazil), vol.12, no.3, p.473-95 (Sept. 1982). In Portuguese.

With aid of a configuration-velocity-dependent projector field, constructed with the constraint conditions, the authors establish the fundamentals of a geometric model for classical constrained Lagrangian dynamics. The projector behaves as a singular metric field. Only constraints which are homogeneous of the first degree in the velocities are considered. A generalized variational Hamiltonian principle is established as a function of the projector field. The formalism developed can be the starting point for the construction of Hamiltonian constrained formalisms. (8 refs.)

98847 Integral representations and addition theorems for product of confluent hypergeometric functions derived by Green's function. J.Bellandi Filho, E.C.de Oliveira (Inst. de Fisica 'Gleb Wataghin', UNICAMP, Sao Paulo, Brazil).

Rev. Bras. Fis. (Brazil), vol.12, no.4, p.611-18 (Dec. 1982).

Integral representations and addition theorems for the product of confluent hypergeometric functions can be obtained by means of isotropic harmonic oscillator Green's functions. (6 refs.)

98848 Inverse problem for the Schrodinger equation with a linearly increasing potential-asymptotic behavior. A.R.Frenkin (M.V. Lomonosov Moscow State Univ., Moscow, USSR).

Sov. Phys. J. (USA), vol.25, no.11, p.1046-9 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.11, p.81-4 (Nov. 1982).

Asymptotic formulas for the correction to a linearly increasing potential are found without solving the Gel'fand-Levitan equation for a change in the number of states and a shift in the energy levels within an arbitrary finite region on the spectrum. The method is generalized for arbitrary restraining potentials V(r) ($r \rightarrow \infty \lim V(r) = \infty$) for which in general the radial Schrodinger equation with fixed orbital angular momentum l cannot be solved exactly. (7 refs.)

98849 Completeness of derivatives of squared Schrodinger eigenfunctions and explicit solutions of the linearized KdV equation. R.L.Sachs (Maths. Res. Center, Univ. of Wisconsin-Madison, Madison, WI, USA).

SIAM J. Math. Anal. (USA), vol.14, no.4, p.674-83 (July 1983).

Explicit solutions to that Cauchy problem for the linearized KdV equation are constructed when the initial data is integrable. The method is analogous to the Fourier decomposition for a constant coefficient equation and uses the connection between the one-dimensional Schrodinger equation and the KdV equation, as discovered by Gardner, Greene, Kruskal and Miura (1974). An expansion theorem expressing any integrable function in terms of derivatives of squared Schrodinger (generalized) eigenfunctions is proved. These functions evolve according to the linearized KdV equation, hence the expansion of the initial data leads to a generalized solution of the linearized KeV equation. Under suitable restrictions on the initial data, the solution constructed is classical. The proof of the expansion theorem may be interpeted as the skew-adjoint analogue of the more familiar process of simultaneously diagonalizing two self-adjoint operators. (16 refs.)

98850 The local geometric asymptotics of continuum eigenfunction expansions. II. One-dimensional systems. S.A.Fulling (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA).

SIAM J. Math. Anal. (USA), vol.14, no.4, p.780-95 (July 1983).

For pt.I see ibid., vol.13, p.891-912, 1982. For the solutions of a system of ordinary differential equations of the type $\psi''(x) + [E(x) + \rho^2]\psi(x) = 0$, where ψ is vector valued and $E(x)$ is an Hermitian matrix, the author constructs a phase-integral expansion, valid as $|\rho| \rightarrow \infty$, of the form $\psi(x) \sim A(x)\nu(x)$, where $\nu(x)$ is a unit vector and $A(x)$ is a positive number depending only on E and its derivatives at x. The terms in the series expansions of $A(x)$ and of the first-order differential equations determining $\nu(x)$ can be obtained as elements of a matrix series $N(x)$, which relates the basic solutions to their derivatives. If E vanishes at infinity, initial data consisting of a basis of eigenvectors of $N(x_0)$ are mapped by the phase-integral approximation into an orthogonal set of vectors at $x = \infty$. It follows that the spectral densities (normalization factors) in the eigenfunction expansion associated with the operator $-d^2/dx^2 - E(x)$ and the point x_0, and hence the corresponding heat-kernel series, can be simply expressed in terms of $N(x_0)$. The recursive calculation of the numerical coefficients in all these series can be efficiently computerized. (16 refs.)

98851 Initial boundary value problem for one class of system of multidimensional nonlinear Schrodinger equations with wave operator. Guo Boling.

Sci. Sin. (China), vol.26, no.6, p.561-75 (June 1983).

The author proves the existence and uniqueness of the generalized and strong solutions for the initial-boundary value problem of one class of the system of multidimensional nonlinear Schrodinger equations with wave operator by means of the Galerkin method, and discusses the regularity of the solution. For one-dimensional case, the existence of the smooth solution under weaker assumptions is obtained. (6 refs.)

98852 Clebsch-Gordan coefficients of the SU_3 group that satisfy boundary conditions. S.J.Alisauskas (Inst. of Phys., Acad. of Sci., Lithuanian SSR).

Sov. Phys.-Collect. (USA), vol.22, no.2, p.9-14 (1982). Translation of: *Litov. Fiz. Sb. (USSR)*, vol.22, no.2, p.13-19 (1982).

A unified analytical expression is constructed for the isoscalar factors of the Clebsch-Gordan coefficients of the canonical basis of the SU_3 group, that satisfied the simplest conditions in the boundary region with a power equal to the multiplicity of irreducible representations in the expansion of the direct product. An optimal expression is given for the overlap matrices required to orthonormalize the system of isofactors under consideration. (5 refs.)

98853 Solution of the Schroedinger equation in the potential representation for Coulomb interactions. A.J.Janavicius.

Sov. Phys.-Collect. (USA), vol.22, no.2, p.15-22 (1982). Translation of: *Litov. Fiz. Sb. (USSR)*, vol.22, no.2, p.20-9 (1982).

The two-particle and multiparticle problems for bound states are solved by the potential representation method. It is shown that the radial wave function can be represented as the product of the solution without centrifugal forces and a function that takes account of the centrifugal potential. In the case of the multiparticle problem it is shown that the wave function can be represented as the product of an additional function that takes account of interelectron interactions and a function that takes account of the interaction between electron and nucleus. The resultant equations are used to compute the energy of the ground state of the helium atom. (7 refs.)

98854 Fractals and quantum mechanics. A.D.Allen (Algorithms Inc., Northridge, CA, USA).
Speculations Sci. & Technol. (Switzerland), vol.6, no.2, p.165-70 (June 1983).
Abbott and Wise (1981) have described the path of a quantum mechanical particle as a fractal of dimensionality two. A particle path cannot literally be a fractal, but the underlying idea, first proposed by Schrodinger, is interesting. Here this idea is used to derive the uncertainty principle as a consequence of a real particle's interactions with vacuum particles. The speculation that arises is that the uncertainty principle might be violated for a particle that is decoupled from the vacuum. (7 refs.)

98855 Quantum-mechanical Goryachev-Chaplygin top in a strong field. I.V.Komarov.
Theor. & Math. Phys. (USA), vol.53, no.2, p.1136-41 (Nov. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.2, p.296-304 (Nov. 1982).
It is shown that in a strong field the Goryachev-Chaplygin top behaves like a two-dimensional harmonic oscillator with frequency ratio 1:2. Moreover, the second integral of the motion of the top goes over into the separation constant for the 2-oscillator in parabolic coordinates in the momentum space. The diagram correlating the energy levels of the top in the limits of weak and strong fields is found. (9 refs.)

98856 Quantization of symplectic manifolds with conical points. M.V.Karasev, V.P.Maslov (Moscow Inst. of Electronic Engng., Moscow, USSR).
Theor. & Math. Phys. (USA), vol.53, no.3, p.1186-95 (Dec. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.3, p.374-87 (Dec. 1982).
Quantization of a general nonlinear phase manifold X in the quasiclassical approximation leads to the two-dimensional analog of the Bohr-Sommerfeld conditions, in which the form pdq is replaced by $dp \wedge dq$ and the vacuum energy h/2 by hν/2, where ν is the index of two-dimensional noncontractable cycles in X. A study is made of smooth manifolds X on which the index ν is integral and manifolds with conical singularities, on which ν can take half-integral values. Smooth functions f on X are associated with operators $\hat{f}$ that act on the sections of a certain sheaf and locally have the form $\hat{f}=f(q,-ih\partial/\partial q)$, $h \rightarrow 0$. (31 refs.)

98857 Quantum dynamics. B.A.Huberman (Xerox Palo Alto Res. Center, Palo Alto, CA, USA).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.79-90
The author considers that it is appropriate for a conference devoted to Nonlinear Dynamics and Chaos to include a set of lectures on the problem of quantum dynamics. For although the interest of the past few years has been mainly focused on classical chaotic dynamics, the quantum problem still poses both intriguing questions and tantalizing applications, problems which have not been the focus of much activity until now. He shows that quantum dynamics still presents unresolved problems; problems whose resolution in a crisp and unambiguous way might lead to insights into the way the classical limit obtains, as well as a deeper understanding of quantum ergodicity. (13 refs.)

98858 Analysis of comparison of different ways of identification of spin functions variables. Z.Maric, M.Bozic (Inst. of Phys., Beograd, Yugoslavia).
Group Theoretical Methods in Physics. Proceedings of the XI International Colloquium, Istanbul, Turkey, 23-28 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.486-91 (8 refs.)

98859 On the algebraic properties of the Luttinger model. K.A.Rustamov (Inst. of Phys., Acad. of Sci., Baku, Azerbaijan SSR).
Group Theoretical Methods in Physics. Proceedings of the XI International Colloquium, Istanbul, Turkey, 23-28 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.549-52
The system of differential equations for the elements of the tangent vector field corresponding to the Lie group of equivalence of the Schrodinger equations family with the Luttinger type Hamiltonian depending on an arbitrary potential function are analyzed. The absence of any operator of the first order in linear momentum operator in the Lie algebra of invariance of the problem has been proved. The obtained equations in the limit $\sigma=0$ of the parameters enable one to get the Lie groups of equivalence of a various problems of quantum mechanics. In the case of $\sigma=O$ the kernel of the basic groups of the mentioned family of equations is demonstrated to be physically trivial. (10 refs.)

98860 Quantum scattering transformation. L.D.Faddeev (Steklov Math. Inst., Acad. of Sci., Leningrad, USSR).
Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981, Freiburg, Germany, 31 Aug.-11 Sept. 1981 (New York, USA: Plenum 1983), p.93-114
In one-dimensional mathematical physics three successful lines of development—the Bethe-Hulthen theory of quantum magnetics, the Onsager-Baxter theory of planar models in statistical mechanics, and the Gardner-Greene-Kruskal-Miura-Zakharov-Shabat inverse scattering method in classical field theory—are known. Recently it has been realized that after quantization of the latter method, a unified approach to all three of these lines emerges. This new method—the quantum inverse method or quantum scattering transformation (QST)—is now three years old and continues to develop rapidly in several centers (Leningrad Steklov Institute, Fermilab, Batavia, Freiburg University, etc.). The author mentions some very recent developments made in the Leningrad group. (39 refs.)

03.70 THEORY OF QUANTIZED FIELDS

(see also 11.10 Field theory)

98861 Radiation gauge covariance. II. Quantization of free electromagnetic field. J.Krause (Inst. de Fisica, Univ. Catolica de Chile, Santiago, Chile).
J. Math. Phys. (USA), vol.24, no.8, p.2208-11 (Aug. 1983).
For pt.I see ibid., vol.22, p.1759 (1983). The 'substratum' of the electromagnetic field is defined as a two-dimensional duality isovector, satisfying the homogeneous wave equation. The components of the substratum are two Lorentz scalar fields that carry the two degrees of freedom of the field. It is then shown that the free Maxwell field becomes effectively quantized by the canonical quantization of the substratum. The equal-time canonical commutator thus obtained is precisely the same commutator one gets while quantizing the electromagnetic field within the Coloumb gauge. The whole approach is manifestly relativistic. (14 refs.)

98862 Stochastic quantization method of fermion fields. T.Fukai, H.Nakazato, I.Ohba, K.Okano, Y.Yamanaka (Dept. of Phys., Waseda Univ., Tokyo, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.5, p.1600-16 (May 1983).
Stochastic quantization of fermion fields is formulated, where the probability distribution P and the expectation value in P can be defined properly. The equivalence between the stochastic quantization and the path integral in Euclidean field theory is shown in free case. The general treatment of interacting case is also discussed. (7 refs.)

98863 On the interaction of quantum spinor fields with extended objects. H.Matsumoto, G.Semenoff, H.Umezawa (Theoretical Phys. Inst., Univ. of Alberta, Edmonton, Alberta, Canada).
Prog. Theor. Phys. (Japan), vol.69, no.5, p.1631-46 (May 1983).
In scalar quantum field theory with an extended object it has been shown that the space-time c-numbers (x,t) and the quantum mechanical operators associated with the extended object appear only through a particular combination called the generalized coordinates. The authors study the structure of a spinor field interacting with an extended object. It will be shown that the spinor field becomes a product of a kind of spinor operator and a scalar-like field. This spinor operator turns out to be the Lorentz boost operator with the quantum velocity $Q=p/H$. The scalar-like field describes the quantum particles in reference to a coordinate system which is attached to the extended object. (10 refs.)

98864 The rotational mode of asymmetric objects in quantum field theory. N.J.Papastamatiou (Dept. of Phys., Univ. of Wisconsin-Milwaukee, Milwaukee, WI, USA), H.Matsumoto, H.Umezawa.
Prog. Theor. Phys. (Japan), vol.69, no.5, p.1647-65 (May 1983).
Nonspherical extended objects in (2+2)-dimensional quantum field theory are studied. The nonspherical nature creates a new set (ω, S) of quantum mechanical operators in addition to the quantum coordinate (and its canonical conjugate) of an extended object and the usual creation and annihilation operators for quantum particles. These new operators are closely associated with the rotational quantum modes. The invariance of the theory under Poincare group transformations specifies the way in which the quantum mechanical operators appear in the Heisenberg fields. The Wigner rotation induced by a Lorentz boost is naturally absorbed by a transformation of the angle operator ω. (7 refs.)

98865 Canonical quantization of local scalar fields over quantum space-time. M.Banai.
Report KFKI-1983-51, Hungarian Acad. Sci., Budapest (1983), 18 pp.
Canonical quantization of a classical local field theory (CLFT) consisting of N real scalar fields is formulated in the Hilbert space $H \otimes \hat{A}$ over the *-algebra $\hat{A}$ of linear operators of $L^2(R^3)$. The canonical commutation relations (CCR) have an irreducible solution in $H \otimes \hat{A}$, unique up to $\hat{A}$-unitary equivalence. The canonical equations as operator eq.'s are equivalent to the classical field eq.'s. The interaction picture can be introduced in a well-defined manner. The main advantage of this treatment is that the corresponding S-matrix is free of divergences. The Feynman's graph technique is adaptable in a straightforward manner. This approach is a natural extension of the conventional canonical quantization method of quantum mechanics. (21 refs.)

03.80 GENERAL THEORY OF SCATTERING

(see also 11.20 S-matrix theory, and 11.80 Relativistic scattering)

98866 Interaction of a light particle with a system of heavy particles. D.A.Kirzhnits, F.M.Pen'kov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
JETP Lett. (USA), vol.37, no.3, p.155-7 (5 Feb. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.3, p.129-31 (5 Feb. 1983).
When a light particle interacts with a bound complex, the decay over distance is described by a $1/r^2$ law instead of a $1/r^4$ law. The corresponding force is unusual in several respects. It is proportional to the mass of the particle; it acts only in the s state of the particle; it generates a series of bound states similar to Efimov (1970) levels, etc. (2 refs.)

04.00 RELATIVITY AND GRAVITATION

(for special relativity, see 03.30; for relativistic astrophysics, see 95.30; for relativistic cosmology, see 98.80)

04.20 GENERAL RELATIVITY

(see also 02.40 Geometry and topology)

98867 An inhomogeneous cosmological solution of Einstein's equations. G.Siemieniec-Ozieblo (Astron. Obs., Jagellonian Univ., Cracow, Poland).
Acta Phys. Pol. B (Poland), vol.B14, no.7, p.465-9 (July 1983).
The construction of the conformally flat and inhomogeneous solution of Einstein's equations is presented. The Bondi type energy tensor has been used as a source. (3 refs.)

98868 Note of positions of particles in classical relativistic mechanics. V.Pazma (Ustav Fyziky a Biofyziky UK, Bratislava, Czechoslovakia).
Acta Phys. Slovaca (Czechoslovakia), vol.33, no.4, p.217-23 (1983).
The relation between world-lines and the position vector of a particle is studied from the gauge theoretical point of view. The expressions for the position vector of a free relativistic particle as well as of two interacting particles described by the Todorov-Komar model are derived under plausible assumptions. The relation between the physical meaning of basic canonical variables and the choice of a gauge is also discussed. (7 refs.)

98869 All vacuum metrics with space-like symmetry and shearing geodesic eigenrays. B.Lukacs (Central Res. Inst. for Phys., Budapest, Hungary).
Acta Phys. Slovaca (Czechoslovakia), vol.33, no.4, p.225-33 (1983).
The paper contains the general solution of the Einstein equation for space-like symmetric vacuum having shearing geodesic eigenrays. The result is that the rotation of the eigenrays vanishes (except the Minkowski space-time), and the solutions belong to two groups. One of them contains solutions with functional dependence among some field quantities (the Papapetrou solutions and the Kasner solution). The other group contains new solutions. (10 refs.)

98870 Noether's theorem for a nonholonomic system. M.Hussain (Dept. of Math., Government Coll., Lahore, Pakistan).
Arch. Mech. (Poland), vol.34, no.4, p.409-17 (1982).
The purpose of the paper is to extend Noether's theorem to a conservative linear nonholonomic system whose position is specified by generalised coordinates. This extension is based upon the concept of admissible infinitesimal symmetry transformation under which the Lagrangian is divergence invariant. The existence of first integrals depends on the existence of solutions of a system of partial differential equations the so-called Killing equations. All known results regarding the first integrals are deduced as special cases. Finally, an example is given to illustrate of the theory. (10 refs.)

98871 A constructive-axiomatic approach to the Lie structure in general spacetime by the principle of approximative reproducibility. D.Mayr (Sektion Phys., Univ. Munchen, Munchen, Germany).
Found. Phys. (USA), vol.13, no.7, p.731-43 (July 1983).
The author presents a constructive-axiomatic approach to general spacetime, guided by Ludwig's conception (1978) of an axiomatic base. The leading idea of axiomatization is a generalized version of the equivalence principle—the principle of approximative reproducibility. As fundamental concepts the author uses processes and reproductions of processes. On the universe of processes the point space of events is founded which carries the familiar properties of spacetime topology. a general contact relations for reproductions is the key structure to build up a group of tangential germs (pre-jets). Finally, using Yamabe's characterization the Lie structure is obtained. (16 refs.)

98872 Energy loss due to small-angle scattering in general relativity. A.Rosenblum (Max-Planck-Inst. fur Phys. und Astrophys., Munich, Germany).
J. Phys. A (GB), vol.16, no.12, p.2751-6 (21 Aug. 1983).
The equations of motion in general relativity using a 'fast motion approach' are worked out explicitly to second order. The derivation from first principles with the assumptions made is given. The application of these equations to small-angle scattering will be given in a later paper. (20 refs.)

98873 Completely integrable relativistic Hamiltonian systems and separation of variables in Hermitian hyperbolic spaces. C.P.Boyer (IIMAS, Univ. Nacional Autonoma de Mexico, Mexico City, Mexico), E.G.Kalnins, P.Winternitz.
J. Math. Phys. (USA), vol.24, no.8, p.2022-34 (Aug. 1983).
The Hamilton-Jacobi and Laplace-Beltrami equations on the Hermitian hyperbolic space HH(2) are shown to allow the separation of variables in precisely 12 classes of coordinate systems. The isometry group of this two-complex-dimensional Riemannian space, SU(2,1), has four mutually nonconjugate maximal Abelian subgroups. These subgroups are used to construct the separable coordinates explicitly. All of these subgroups are two-dimensional, and this leads to the fact that in each separable coordinate system two of the four variables are ignorable ones. The symmetry reduction of the free HH(2) Hamiltonian by a maximal Abelian subgroup of SU(2,1) reduces this Hamiltonian to one defined on an O(2,1) hyperboloid and involving a nontrivial singular potential. Separation of variables on HH(2) and more generally on HH(n) thus provides a new method of generating nontrivial completely integrable relativistic Hamiltonian systems. (29 refs.)

98874 Tetrads and arbitrary observers. J.R.Urani (Phys. Dept., Univ. of Missouri, Kansas City, MO, USA), M.H.Kemp.
J. Math. Phys. (USA), vol.24, no.8, p.2061-4 (Aug. 1983).
Recent results concerning globally isometric mappings for arbitrary observers in flat space-time are generalized to space-times admitting a time orientation. Critical to the method is the use of an orthonormal tetrad which, when it is defined globally, allows the construction of a global isometry which generalizes the pointwise boost on flat space-time. Connection coefficients are obtained, thereby defining acceleration covariant differentiation for both particle and tensor field equations. An application to orbiting observers in exterior Schwarzschild geometries is presented. (18 refs.)

98875 Dynamical symmetries: an approach to Jacobi fields and to constants of geodesic motion. G.Caviglia (Istituto Matematico, Univ. di Genova, Genova, Italy).
J. Math. Phys. (USA), vol.24, no.8, p.2065-9 (Aug. 1983).
It is shown that every dynamical symmetry (DS) of the Euler-Lagrange equations derived from the Lagrangian $L={}^1/_2\, g_{ab}\dot{q}^a\dot{q}^b$ identifies a Jacobi field on each geodesic of the configuration manifold. Using the connections between Jacobi fields and DSs, it is proved that DSs always possess associated conserved quantities, whose expression is explicitly written down. An additional constant of motion concomitant with 'pairs' of DSs, independently of the choice of L, is also determined. Applications to general relativity are emphasized in the course of the discussion. (16 refs.)

98876 Static conformally invariant scalar field. A.J.Accioly, A.N.Vaidya, M.M.Som (Inst. de Fisica, Univ. Federal do Rio de Janeiro, Rio de Janeiro, Brazil).
J. Math. Phys. (USA), vol.24, no.8, p.2176-7 (Aug. 1983).
For a massless conformally invariant scalar field, a class of solutions is obtained to the Einstein equations for which the geometry of the space-time admits one timelike and two spacelike Killing vectors. The class of solutions admit plane-symmetric and conformally flat solutions as special cases. The metrics can be interpreted as static cylindrically symmetric solutions if one of the spacelike Killing vectors is associated with rotational motion. (5 refs.)

98877 Unification of Ernst-equation Backlund transformations using a modified Wahlquist-Estabrook technique. B.K.Harrison (Dept. of Phys. & Astron., Brigham Young Univ., Provo, UT, USA).
J. Math. Phys. (USA), vol.24, no.8, p.2178-87 (Aug. 1983).
The three known Backlund transformations for the Ernst equation are derived using a modification of the Wahlquist-Estabrook prolongation procedure. The modification requires that the equation to be studied be cast into a set of differential forms and their exterior derivatives, such that all coefficients are constant (a 'CC ideal'). Analysis of the resulting equations produces 16 solutions composed of the three basic transformations combined with identity and other essentially trivial transformations. The group structure of the transformations is discussed. A Backlund transformation (already known) for the Ernst-Maxwell equations can be found by the same method. Promising generalizations are mentioned. (22 refs.)

98878 On apparent horizons and the Schwarzschild surface for a uniform fluid sphere in general relativity. H.Knutsen (Inst. of Theoretical Phys., Univ. of Warsaw, Warsaw, Poland).
J. Math. Phys. (USA), vol.24, no.8, p.2188-90 (Aug. 1983).
The time history of the marginally trapped surfaces, i.e. the apparent horizons for a spherically symmetric nonstatic fluid of uniform density are studied. Generally it is found that apparent horizons may or may not exist dependent upon the choice of arbitrary functions of integration. However, it is shown in this paper that if the metric is conformally flat or if the circumference of the sphere is an increasing function of a radial coordinate, apparent horizons exist if and only if the surface is inside the Schwarzschild surface. Then there exist in fact at least two horizons: The absolute Schwarzschild surface and an apparent horizon in the interior of the fluid matter. (15 refs.)

98879 Symmetries of the nontwisting type-N solutions with cosmological constant. H.Salazar I., A.Garcia D., J.F.Plebanski (Dept. de Fisica, Centro de Investigacion y de Estudios Avanzados, IPN, Mexico City, Mexico).
J. Math. Phys. (USA), vol.24, no.8, p.2191-6 (Aug. 1983).
The conformal homothetic, and isometric symmetries of all nontwisting type-N solutions are established. All solutions with λ allow at most the existence of two Killing vectors. All vacuum solutions, except the Robinson metric, permit maximally the existence of two (isometric and homothetic) symmetries. The Robinson solutions are the only ones which allow conformal symmetries. (5 refs.)

98880 A scalar-tensor theory of gravity incorporating Mach's principle. N.A.Batakis (Dept. de Phys. Theorique, Univ. de Geneve, Geneva, Switzerland).
Phys. Lett. A (Netherlands), vol.96A, no.7, p.331-4 (18 July 1983).
A solution to the long-standing problem involving the incorporation of Mach's principle into general relativity is proposed in terms of a new scalar-tensor theory of gravity, which seems to introduce no change in the predictions of general relativity for any of its existing tests. (5 refs.)

98881 Some examples of Penrose's quasi-local mass construction. K.P.Tod (Math. Inst., Univ. of Oxford, Oxford, England).
Proc. R. Soc. London Ser. A (GB), vol.388, no.1795, p.457-77 (8 Aug. 1983).
Penrose's quasi-local mass (ibid., vol.381, p.215 (1982)) is calculated for a variety of two-surfaces in particular space-times. The results are compared with other definitions of mass where these are available. (18 refs.)

98882 A new self-consistent solution of the Einstein equations with one-loop quantum-gravitational corrections. L.A.Kofman (Inst. of Astrophys. & Atmosphere Phys., Acad. of Sci., Tartu, Estonian SSR), V.Sahni.
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.197-200 (28 July 1983).
Vacuum averages of quantized fields in the Bertotti-Robinson (1959) space-time are calculated. It is shown that the Bertotti-Robinson space-time is a self-consistent solution of the Einstein equation with one-loop quantum-gravitational corrections induced by fields of large mass. (12 refs.)

98883 Thermal ambience of expanding event horizon in Minkowski space-time. U.H.Gerlach (Dept. of Math., Ohio State Univ., Columbus, OH, USA).
Phys. Rev. D (USA), vol.28, no.4, p.761-71 (15 Aug. 1983).
It is shown that in flat space-time the thermal ambience of accelerated observers is not associated exclusively with flat event horizons, but arises also with (observer-dependent) event horizons that are light cones. The quanta of this ambience are characterized by a generalized frequency which identifies the representation of the Lorentz group. Global and local model detectors, capable of responding to quanta of any given generalized frequency, are exhibited. The discussion of the thermal ambience is implemented in terms of a partial-wave analysis using a set of harmonics on the hyperboloid $x^2+y^2+z^2-t^2=1$. (20 refs.)

98884 Detector error and Einstein-Podolsky-Rosen correlations. A.Garg (Lab. of Atomic & Solid State Phys., Cornell Univ., Ithaca, NY, USA).
Phys. Rev. D (USA), vol.28, no.4, p.785-90 (15 Aug. 1983).
The question of how data collected in the spin-${}^1/_2$ Einstein-Podolsky-Rosen experiment become compatible with local realism for increasing detector error is investigated in two ways. (1) It is shown that data obtained in any experiment with three settings of one detector axis and any number of settings of the other will be compatible with local realism if the detector error is such that data obtained with any two settings of each detector axis are compatible with local realism. (The error rate must be more than 7.96% for this to be so.) (2) It is shown that a detector error rate of 14.64% is enough to mask nonclassical correlations in any experiment with any number of settings of both detector axes; this improves on the figure of 21.13% given by Mermin and Schwarz. (20 refs.)

98885 The structure of the space of solutions of Einstein's equations coupled with scalar fields. R.V.Saraykar (Dept. of Math., Nagpur Univ., Nagpur, India).
Pramana (India), vol.20, no.4, p.293-303 (April 1983).
Following the work of Arms, Fischer, Marsden and Moncrief (1980, 1981, 1982) it is proved that the space of solutions of Einstein's equations coupled with self-gravitating massless scalar fields has conical singularities at each spacetime possessing a compact Cauchy surface of constant mean curvature and a nontrivial set of simultaneous Killing fields either all spacelike or including one (independent) timelike. (20 refs.)

98886 On Cartan's equations on complex manifolds. L.C.Garcia De Andrade (Inst. de Fisica, Univ. Federal do Rio de Janeiro, Rio de Janeiro, Brazil).
Rev. Bras. Fis. (Brazil), vol.12, no.3, p.497-500 (Sept. 1982).
The author discusses Cartan's structure equations on complex manifolds and deduce holomorphic expressions for curvature defined over this manifold. It is possible to construct complex versions of the Einstein field equations by contractions of this curvature. (4 refs.)

98887 Cauchy problem for the Einstein equations. III. A.N.Temchin.
Sov. Phys. J. (USA), vol.25, no.11, p.1068-72 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.11, p.105-9 (Nov. 1982).
The equations of small perturbations of the metric in synchronous coordinates are equivalent to a first-order system for which the Cauchy problem is correct only upon the satisfaction of several conditions imposed on the lowest symbols of the operator. (28 refs.)

04.30 GRAVITATIONAL WAVES AND RADIATION: THEORY

98888 Gravitational radiation from a particle with zero orbital angular momentum plunging into a Kerr black hole. Y.Kojima, T.Nakamura (Dept. of Phys., Kyoto Univ., Kyoto, Japan).
Phys. Lett. A (Netherlands), vol.96A, no.7, p.335-8 (18 July 1983).
The authors have computed the energy ΔE, the momentum ΔP and the angular momentum ΔJ of gravitational radiation induced by a particle of mass μ and of zero orbital angular momentum plunging in the $\theta=\pi/2$ plane into a Kerr black hole of mass $M(\gg\mu)$ and angular momentum Ma. It is found that ΔE for $a=0.99$ M is 4.45×10^{-2} $(\mu^2/M)c^2$, which is 4.27 times larger than that for the $a=0$ case. (13 refs.)

98889 Motion of an ideal fluid in the field of a plane gravitational wave. Yu.G.Ignat'ev (V.I. Ul'yanov-Lenin State Univ. Kazansk, USSR).
Sov. Phys. J. (USA), vol.25, no.11, p.1060-2 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.11, p.96-9 (Nov. 1982).
An exact solution of the equations of relativistic hydrodynamics is found which describes the motion of an initially uniform ideal fluid in the field of a plane gravitational wave of arbitrary amplitude and polarization. For all solutions the author finds that the pressure and energy density develop singularities on the singular surface, and the velocity of the fluid in the direction of propagation of the gravitational wave approaches the speed of light. In the case of the equation of state $\epsilon=p$, the solution becomes intrinsically unstable and describes the generation of sound waves. (4 refs.)

98890 Ideal fluid with the equation of state $\epsilon=p$ in the field of a plane gravitational wave. Yu.G.Ignat'ev (V.I. Ul'yanov-Lenin State Univ., Kazansk, USSR).
Sov. Phys. J. (USA), vol.25, no.11, p.1063-5 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.11, p.99-102 (Nov. 1982).
An exact solution of the equations of relativistic hydrodynamics is obtained for a semiinfinite ideal fluid with the equation of state $\epsilon=p$ in the field of a plane gravitational wave. (1 ref.)

98891 Einstein's formula for gravitational radiation is not a consequence of the general theory of relativity. A.A.Vlasov, V.I.Denisov (Moscow State Univ., Moscow, USSR).
Theor. & Math. Phys. (USA), vol.53, no.3, p.1208-16 (Dec. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.3, p.406-18 (Dec. 1982).
It is shown that the intensity of gravitational radiation and the total intensity determined in the general theory of relativity in accordance with Einstein's formulas depend on the choice of the coordinate system, so that they can be made to vanish or even become negative. Therefore, Einstein's well-known quadrupole formula, which is usually employed in general relativity for calculations, is not a consequence of general relativity and is not contained in it. This result is a particular consequence of the general assertion to the effect that in general relativity there are no energy-momentum conservation laws for a system consisting of matter and the gravitational field. (10 refs.)

04.40 CONTINUOUS MEDIA; ELECTROMAGNETIC AND OTHER MIXED GRAVITATIONAL SYSTEMS

98892 Effects of a $\lambda\Phi^4$ interaction on black-hole evaporation in two dimensions. D.A.Leahy, W.G.Unruh (Dept. of Phys., Univ. of British Columbia, Vancouver, British Columbia, Canada).
Phys. Rev. D (USA), vol.28, no.4, p.694-702 (15 Aug. 1983).
This paper examines the effects of interactions on particle emission by black holes. The model used is the $\lambda\Phi^4$ interaction for a massless scalar field Φ in a two-dimensional model for a black-hole space-time and is compared with the calculation of a flat-space model with spatially varying λ. Although the models suffer from infrared divergences, a number of features of the effect of the interaction on the particle spectrum are discernible. In the absence of any interactions the state of the field is that of a thermal flux of outgoing particles with temperature $T=1/8\pi M$ (the Hawking temperature). If the ingoing state is the vacuum state, the interaction destroys the thermal nature of the outgoing flux. However, if the ingoing flux is thermal with the same temperature as the black hole, detailed balance maintains the thermal character of the outgoing flux. One can regard the ingoing and outgoing fluxes as two separate thermal baths which are coupled by the interaction. If they are at different temperatures, the interaction will destroy the thermal nature of both. (17 refs.)

98893 Collision of two black holes: An analytic nonlinear approximation technique. M.Bovyn (Phys. Dept., Univ. of Texas, Austin, TX, USA).
Phys. Rev. D (USA), vol.28, no.4, p.703-12 (15 Aug. 1983).
Using geodesical and antisymmetric slicing the author calculates in lowest order the three-metric for the problem of two colliding black holes. It is also shown how the appropriate choice of the lapse and shift functions influences the coordinate shear and the smoothness of the three-metric. (20 refs.)

04.50 UNIFIED FIELD THEORIES AND OTHER THEORIES OF GRAVITATION

98894 A note on electromagnetism and the new cosmology. A.H.Klotz, E.J.Vlachynsky (Dept. of Appl. Math., Univ. of Sydney, Sydney, NSW, Australia).
Acta Phys. Pol. B (Poland), vol.B14, no.7, p.471-7 (July 1983).
It is shown that in the absence of an electric charge, the cosmology arising from the generalised field theory (nonsymmetric theory of electromagnetism and gravitation, GFT) collapses into a static, Einstein universe. The observed expansion is a direct consequence of the presence of a net charge which is shown to be necessarily negative. The implications for GFT are discussed. (15 refs.)

98895 Spin fluid in Einstein-Cartan theory: A variational principle and an extension of the velocity potential representation. R.de Ritis (Istituto di Fisica Teorica, Univ. di Napoli, Napoli, Italy), M.Lavorgna, G.Platania, C.Stornaiolo.
Phys. Rev. D (USA), vol.28, no.4, p.713-17 (15 Aug. 1983).
The authors propose a variational principle describing a spin fluid in Einstein-Cartan theory. They also give a potential representation of the Taub current vector. They show that the dynamical description of the spin fluid obtained via this representation is equivalent to the standard equations, and that the material Lagrangian is the pressure. (16 refs.)

98896 Teleparallelism—a viable theory of gravity?. F.Muller-Hoissen, J.Nitsch (Inst. for Theoretical Phys., Univ. of Gottingen, Gottingen, Germany).
Phys. Rev. D (USA), vol.28, no.4, p.718-28 (15 Aug. 1983).
The teleparallelism theory of gravity is presented as a constrained Poincare gauge theory. Arguments are given in favor of a two-parameter family of field Lagrangians quadratic in torsion. The inclusion of a 'parity violating' term in the field Lagrangian avoids difficulties with the initial-data problem, recently discussed in the literature. Several new exact solutions of the corresponding teleparallelism theory give considerable insight into its physical consequences. The resulting general field equations are analyzed in the weak-field approximation excluding ghosts and tachyons. The physical meaning of the six additional components of the tetra field (as compared with the metric) appears naturally from the authors' theory and is made clear. (31 refs.)

98897 Quantum dynamics of Kaluza-Klein theories. T.Appelquist, A.Chodos (J.W. Gibbs Lab., Yale Univ., New Haven, CT, USA).
Phys. Rev. D (USA), vol.28, no.4, p.772-84 (15 Aug. 1983).
Some of the quantum properties of Kaluza-Klein theories are studied. The classical features of these theories are reviewed, and the quantization of the gravitational field in an arbitrary number of dimensions is described. These results are then applied to a detailed analysis of the five-dimensional Kaluza-Klein model. The fifth dimension is taken to be compact and a quantum effective potential, as a function of the five-five component of the metric, is constructed. It is argued that the one-loop computation is reliable as long as the distance around the fifth dimension is large compared to the Planck length. The effective potential separates into two pieces: an induced cosmological constant, independent of the size of the fifth dimension, and a distance-dependent 'Casimir' energy. The cosmological term is subtracted, leaving an attractive Casimir potential which will contract the fifth dimension to a size on the order of the Planck length. Consequences of this result are discussed and some of the ways in which it can be generalised are outlined. (29 refs.)

98898 Magnetic monopole in the general theory of relativity. V.K.Shchigolev (Beshkir Pedagogical Inst., Beshkir, USSR).
Sov. Phys. J. (USA), vol.25, no.11, p.1053-6 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.11, p.89-93 (Nov. 1982).
Equations of motion are obtained for Yang-Mills and Higgs fields using the Georgi-Glashow SO(3)-model in a curved spherically symmetric space-time. Magnetic monopole and dion solutions and the space-time metric are found in the intrinsic gravitational field. A particlelike solution of the magnetic monopole and dion type is constructed in the external field of a static universe in the Bogomol'nyi-Prasad-Sommerfield limit. (15 refs.)

04.60 QUANTUM THEORY OF GRAVITATION

98899 Indefinite-metric quantum field theory of general relativity. XVI. Extension of tensorlike commutation relations. N.Nakanishi (Res. Inst. for Math. Sci., Kyoto Univ., Kyoto, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.5, p.1617-30 (May 1983).
For pt.XI see ibid., vol.68, no.3, p.847-59 (1982). The tensorlike four-dimensional commutation relation between a tensor and the gravitational B field b_ρ is extended to the 'geometric' four-dimensional commutation relation between a more general local operator and b_ρ. Correspondingly, the tensorlike equal-time commutation relations also are generalized. The mechanism under which nongeometric terms appear is analyzed in detail, and the conditions for their absence are found. (6 refs.)

98900 Strong-coupling quantum gravity. II. Solution without gauge fixing. M.Pilati (Blackett Lab., Imperial Coll., London, England).
Phys. Rev. D (USA), vol.26, no.4, p.729-44 (15 Aug. 1983).
For pt.I see ibid., vol.26, p.2645 (1982). The quantization of a strong-coupling limit of general relativity begun in a previous paper is continued. The theory is quantized without fixing a gauge since in this form the problem of properly taking into account the gauge degrees of freedom can be directly attacked in the perturbation theory. The formalism of the scattering theory on $\mathbf{R}\times SL(3,\mathbf{R})/SO(3)$ is developed with strong use made of analysis on that space. (32 refs.)

98901 An approach to quantum gravity. T.Padmanabhan (Tata Inst. of Fundamental Res., Bombay, India).
Phys. Rev. D (USA), vol.28, no.4, p.745-55 (15 Aug. 1983).
A model for quantum gravity is presented by treating the light-cone structure of space-time as classical and the conformal factor as a quantum degree of freedom. The motivation and the details of the formalism are discussed. The approach is used to discuss the question of singularities in the cosmological models. It is shown that one can introduce the concept of stationary states for the quantum geometry, in analogy with the stationary states of simple quantum systems. The quantum stationary geometries (QSGs) avoid the classical singularities. The light-cone structure is determined by a set of equations involving the expectation values in the QSG concerned. The cosmological implications of the formalism, especially to matter creation, flatness, etc., are discussed. The theory is conformally invariant in the quantum level. (34 refs.)

98902 Universe before Planck time: A quantum gravity model. T.Padmanabhan (Tata Inst. of Fundamental Res., Bombay, India).
Phys. Rev. D (USA), vol.28, no.4, p.756-60 (15 Aug. 1983).
A model for quantum gravity can be constructed by treating the conformal degree of freedom of spacetime as a quantum variable. An isotropic, homogeneous cosmological solution in this quantum gravity model is presented. The spacetime is nonsingular for all the three possible values of three-space curvature, and agrees with the classical solution for time scales larger than the Planck time scale. A possibility of quantum fluctuations creating the matter in the universe is suggested. (5 refs.)

98903 Some remarks on gravity and quantum mechanics. R.Penrose (Math. Inst., Oxford, England).
Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop, London, England, 3-21 Aug. 1981 (Cambridge, England: Cambridge 1982), p.3-10
Reviews the nature of a union between gravitation theory and quantum mechanics. The author discusses the quantisation of gravity and the motivation for doing it. (9 refs.)

98904 An experimental test of quantum gravity. D.N.Page (Dept. of Phys., Pennsylvania State Univ., University Park, PA, USA), C.D.Geilker.
Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop, London, England, 3-21 Aug. 1981 (Cambridge, England: Cambridge 1982), p.11-21
The authors performed an experiment to make a test of semiclassical gravity. A quantum-mechanical decision and amplification process was used to set the position of certain macroscopic masses. As amplitudes for different decisions occurred, ψ the wavefunction of the matter, developed simultaneous components in which the masses were in macroscopically different configurations. The gravitational field induced by the masses was measured in their component and was found to be highly correlated with the mass distribution in our component alone. There was no indication of any gravitational coupling with other components of ψ. This was consistent with quantum gravity but inconsistent with the semiclassical Einstein equations. (29 refs.)

98905 Quantum mechanical origin of the sandwich theorem in classical gravitation theory. C.Teitelboim (Center for Theoretical Phys., Univ. of Texas, Austin, TX, USA).
Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop, London, England, 3-21 Aug. 1981 (Cambridge, England: Cambridge 1982), p.23-36
The idea that the sandwich theorem is only a classical notion is already present in the writings by Wheeler (1964), where an illuminating analogy with the harmonic oscillator is given. However, the precise way in which the theorem emerges from quantum theory could not be spelled out at that time due to the lack of an appropriate expression for the quantum mechanical propagation amplitude. It is the purpose of this article to fill in that gap in the light of some results in a proper-time approach to quantized gravitation theory (Teitelboim 1980, 1981). Thus it is shown precisely how the semiclassical approximation to the quantum propagation amplitude from one three-geometry to another brings the sandwich theorem into play. Particular attention will be paid to the case when the two faces of the sandwich intersect each other. (11 refs.)

98906 θ-states induced by the diffeomorphism group in canonically quantized gravity. C.J.Isham (Blackett Lab., Imperial Coll., London, England).
Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop, London, England, 3-21 Aug. 1981 (Cambridge, England: Cambridge 1982), p.37-52
Studies of the effects of spatial or spacetime topology in quantum gravity are an interesting part of the whole quantization programme. In particular, investigations of this type seem a natural prerequisite to the attainment of one of the ultimate goals—to subject the topology itself to some sort of quantization. There are several possible approaches to the problem so the author concentrates on developing an analogue of the vacuum θ-structure that arises in Yang-Mills theory. The decomposition of the vector space of quantum states into θ-sectors is a direct consequence of specific topological properties of the local gauge group. These, in turn, reflect certain aspects of the topological structure of space and/or spacetime which are thereby coded into the quantum field theory. (26 refs.)

98907 Strong coupling quantum gravity: an introduction. M.Pilati (Blackett Lab., Imperial Coll., London, England).
Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop, London, England, 3-21 Aug. 1981 (Cambridge, England: Cambridge 1982), p.53-69
In recent years strong coupling quantum field theory has excited much interest. The problem that has been of most interest is that of strong coupling Yang-Mills as applied to the strong interactions. A strong coupling limit of general relativity is considered to study strong coupling gravity. (26 refs.)

98908 Quantizing fourth order gravity theories. S.M.Christensen (Dept. of Phys. & Astron., Univ. of North Carolina, Chapel Hill, NC, USA).
Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop, London, England, 3-21 Aug. 1981 (Cambridge, England: Cambridge 1982), p.71-86
Fourth order gravity theories provide a 'laboratory' for investigating nearly every pathological feature that can occur in a quantum field theory without being hopelessly non-renormalizable. The author presents an overview of the important features of the one-loop calculations involved in quantizing fourth order gravity. (23 refs.)

98909 Green's functions, states and renormalisation. M.R.Brown (Dept. of Astrophys., Univ. of Oxford, Oxford, England), A.C.Ottewill.
Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop, London, England, 3-21 Aug. 1981 (Cambridge, England: Cambridge 1982), p.87-103
Examines the significance that is to be attached to different operator orderings of free quantum field theories in curved space-time. By so doing the authors hope to cast some light on the now standard, albeit ad hoc, renormalisation of such theories. They argue that, as in flat space, these theories should be rendered finite by normal ordering with respect to a local geometrical vacuum state. (20 refs.)

98910 Introduction to quantum Regge calculus. M.Rocek (California Inst. of Technol., Pasadena, CA, USA), R.M.Williams.
Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop, London, England, 3-21 Aug. 1981 (Cambridge, England: Cambridge 1982), p.105-16
The authors look at some rudimentary aspects of an approach to the quantization of gravity using Regge's discrete description of general relativity (Regge 1961). (8 refs.)

98911 Spontaneous symmetry breaking in curved space-time. D.J.Toms (Imperial Coll., London, England).
Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop, London, England, 3-21 Aug. 1981 (Cambridge, England: Cambridge 1982), p.117-29
Discusses an approach which deals with some of the complications which arise when one attempts to study spontaneous symmetry breaking beyond the tree-graph level in situations where the effective potential may not be used. These situations include quantum field theory on general curved backgrounds or in flat space-times with non-trivial topologies. One example discussed briefly here is a report of some work which the author has done in collaboration with L.H. Ford (Ford and Toms 1981). (50 refs.)

98912 Spontaneous symmetry breaking near a black hole. M.S.Fawcett, B.F.Whiting (Dept. of Appl. Math. & Theoretical Phys., Univ. of Cambridge, Cambridge, England).
Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop, London, England, 3-21 Aug. 1981 (Cambridge, England: Cambridge 1982), p.131-54
Describes the calculation of $<\phi^2>$ in a scalar theory, which determines the effective action at the one loop level. The authors compute values of $<\phi^2>$ for a black hole in thermal equilibrium and for an incoming flux of thermal radiation at infinity, and take their difference to obtain results for a black hole radiating into empty space, since this more nearly approximates the situation for small black holes radiating at the present time. It turns out that $<\phi^2>$ differs significantly from the flat space result only in a rather small region around the black hole. They then also discuss phase transitions, spontaneous symmetry breaking, $<\phi^2>$ regularisations and the evaluation of $<\phi^2>$. (15 refs.)

98913 Yang-Mills vacua in a general three-space. G.Kunstatter (Dept. of Phys., Univ. of Toronto, Toronto, Ontario, Canada).
Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop, London, England, 3-21 Aug. 1981 (Cambridge, England: Cambridge 1982), p.155-68
Illustrates with a few simple examples the effect that the non-trivial topology of three-space might have on the vacuum structure of a canonically quantized Yang-Mills theory. The present discussion is based on a more detailed analysis done recently by Isham and Kunstatter (1981). (17 refs.)

04.65 SUPERGRAVITY

98914 $N=1$ supergravity with nonminimal coupling: a class of models. Ngee-Pong Chang, S.Ouvry, Xizeng Wu (Dept. of Phys., City Univ. of New York, New York, NY, USA).
Phys. Rev. Lett. (USA), vol.51, no.5, p.327-30 (1 Aug. 1983).
The component formulation of the Wess-Zumino superspace action leads, when compared with the general results of Cremmer et al. (1979, 1982, 1983) to a nonminimal version of $N=1$ supergravity. A new superpotential, $g_2(z)$, has been found that gives a scalar potential $V(z)$ that is even in z and which breaks supersymmetry inside the circle of radius $\sqrt{6}/\mathbf{k}$ in the complex $\langle z\rangle$ plane. (9 refs.)

98915 Octonionic torsion on S^7 and Englert's compactification of $d=11$ supergravity. F.Gursey, Chia-Hsiung Tze (Dept. of Phys., Yale Univ., New Haven, CT, USA).
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.191-6 (28 July 1983).
In an octonionic realisation of the Cartan-Schouten parallelism on S^7 the authors exhibit the algebraic nature and Hopf topology of Englert's solutions for spontaneously compactified $d=11$ supergravity. The S^7 torsion and its dual, the index 4 gauge field are given locally by the Cayley structure constants and the associator of the imaginary octonion units, respectively. (26 refs.)

98916 Consistent supergravity in six dimensions without action invariance. R.D'Auria, P.Fre (Istituto di Fisica, Univ. di Turin, Turin, Italy), T.Regge.
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.44-50 (18 Aug. 1983).
The authors show by an explicit example with a model of $D=6$ supergravity, containing the sechsbein, a Weyl gravitino and a two-index photon, that a consistent theory on the group-manifold might have no counterpart in the usual Noether approach. In this model the self-duality of the Maxwell field strength F_{abc}, necessary to match the Bose-Fermi on-shell degrees of freedom, follows from group-manifold variational equations but not from their x space restriction. As a consequence, the theory is consistent, although the x space lagrangian is not supersymmetric invariant. (5 refs.)

98917 Gravitation and symmetry breaking. R.Anishetty, P.Jetzer (Theoretical Phys., ETH-Honggerberg, Zurich, Switzerland), J.-M.Gerard, D.Wyler.
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.51-4 (18 Aug. 1983).
Among the possible vacua, quantum gravity within the stationary phase approximation selects the vacuum with vanishing cosmological constant. Classical background gravity coupled to matter renders the highest Higgs potential minimum stable, allowing for spontaneous supersymmetry breaking. The influence of the non-renormalizability of supergravity on the symmetry breaking pattern is studied. (13 refs.)

98918 Graded bundles in the Ogievetsky-Sokatchev supergravity. J.Czyz.
Group Theoretical Methods in Physics. Proceedings of the XI International Colloquium, Istanbul, Turkey, 23-28 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.481-5
The trivial smooth graded bundles and the trivial and non-trivial analytic ones are presented. The applications of graded bundles in supergravity are discussed. (10 refs.)

98919 The new minimal formulation of N=1 supergravity and its tensor calculus. M.F.Sohnius (Blackett Lab., Imperial Coll., London, England), P.C.West.
Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop, London, England, 3-21 Aug. 1981 (Cambridge, England: Cambridge 1982), p.187-222
Non-extended supergravity is the generally relativistic field theory of a graviton with spin 2 and a massless spin-$^3/_2$ Majorana particle, the gravitino. It therefore describes 2 (bosonic)+2 (fermionic) degrees of freedom for physical states. In terms of fields, the graviton is described by the vierbein $e_\mu{}^a$ with 16 real field components and the gravitino by a Majorana vector-spinor $\psi_{\mu\alpha}$ with also 16 real components. The gauge-invariances of the theory are four general coordinate transformations and six local Lorentz rotations, both bosonic, and the four components of an N=1 local supersymmetry transformation which is fermionic in nature. This leaves 6+12 off-shell field components for $e_\mu{}^a$ and $\psi_{\mu\alpha}$. Since supersymmetry requires matching numbers of bosonic and fermionic degrees of freedom, one can see that an off-shell formulation must have 6+0, modulo 4+4, auxiliary field. A version with no fermionic and six bosonic ones is called a 'minimal' off-shell supergravity. (40 refs.)

98920 A new deteriorated energy-momentum tensor. M.J.Duff (Phys. Dept., Imperial Coll., London, England), P.K.Townsend.
Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop, London, England, 3-21 Aug. 1981 (Cambridge, England: Cambridge 1982), p.223-37
It is well known that the stress-tensor $_{\mu\nu}$ of a scalar field theory is not unique because of the possibility of adding an 'improvement' term, e.g. for the model $\mathcal{L}=-^1/_2(\partial_\mu\phi)^2$ there is a family of stress-tensors $T_{\mu\nu}(\xi)=-[\partial_\mu\phi\partial_\nu\phi-{}^1/_2\eta_{\mu\nu}(\partial\phi)^2]-\xi(\Box\eta_{\mu\nu}-\partial_\mu\partial_\nu)\phi^2$ parameterized by the constant ξ, which is the coefficient of an identically conserved addition to $T_{\mu\nu}$. The ξ-term does affect the trace $T_\mu{}^\mu$, however, and for $\xi={}^1/_6$ we have $T_\mu{}^\mu=0$. The $T_{\mu\nu}$ for this value of ξ is called the 'new-improved' stress tensor (Callan et al. 1970). The authors refer to it as the conformally improved stress-tensor and the parameter ξ as the improvement coefficient. If $\xi\neq{}^1/_6$, so that $T_\mu{}^\mu\neq0$, they refer to the corresponding $T_{\mu\nu}$ as a 'deteriorated' stress-tensor, hence the title. The gravitational coupling of the scalar field ϕ with stress-tensor $T_{\mu\nu}(\xi)$ corresponds to an extra term $\xi R\phi^2/2$ in the curved space Lagrangian. The action is then Weyl (local scale) invariant for the special value $\xi={}^1/_6$ and it was in this context that the ξ parameter was first introduced (Penrose 1965). (31 refs.)

98921 Off-shell N=2 and 4 supergravity in five dimensions. P.Howe (CERN, Geneva, Switzerland).
Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop, London, England, 3-21 Aug. 1981 (Cambridge, England: Cambridge 1982), p.239-53
Currently available x-space Lagrangians for supergravity theories with $N\geq3$ (Ferrara et al. 1977; Freedman and Schwarz 1978; Cremmer et al. 1978; Cremmer and Julia 1979) do not contain auxiliary fields so that the supersymmetry algebra only closes if the field equations are satisfied. In order to quantize these theories it is therefore desirable to know the auxiliary fields and, if possible, to have a superspace formulation, since in the latter case one might hope to be able to use supergraph techniques. The author discusses the auxiliary field problem for N=2 and 4 supergravities in five dimensions from a superspace point of view. (24 refs.)

98922 Supergravity in high dimensions. P.van Nieuwenhuizen (Inst. for Theoretical Phys., State Univ. of New York, Stony Brook, NY, USA).
Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop, London, England, 3-21 Aug. 1981 (Cambridge, England: Cambridge 1982), p.255-81
Discusses the quantisation of supergravity in d=11 dimensions which leads to the termination of ghost couplings. The author constructs the N=1 gauge action and the supersymmetric Yang-Mills action in d=10 and then uses the method of currents to find information on the auxiliary fields. (21 refs.)

98923 Building linearised extended supergravities. J.G.Taylor (Dept. of Math., King's Coll., London, England).
Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop, London, England, 3-21 Aug. 1981 (Cambridge, England: Cambridge 1982), p.283-98
Describes show candidates for auxiliary field multiplets may be discovered for unextended and extended supergravities using field redefinition rules. These may then be supplemented by component transformation rules to select nonlinearisable supergravities. The existence of a barrier at N=3 is demonstrated and candidate auxiliary multiplets with central charges presented for N=4 supergravity. The extension of this analysis to N=8 and N=4 Yang-Mills is finally discussed. (20 refs.)

98924 (Super)gravity in the complex angular momentum plane. M.T.Grisaru (Dept. of Phys., Brandeis Univ., Waltham, MA, USA).
Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop, London, England, 3-21 Aug. 1981 (Cambridge, England: Cambridge 1982), p.299-315
Discusses the complex angular momentum plane, relations between the Kronecker delta singularities and counterterms, and Regge poles in N=8 supergravity. (12 refs.)

98925 The multiple structure of solitons in the O(2) supergravity theory. G.W.Gibbons (Univ. of Cambridge, Cambridge, England).
Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop, London, England, 3-21 Aug. 1981 (Cambridge, England: Cambridge 1982), p.317-21
The notion of a black hole soliton in Quantum Gravity has recently been clarified by Hajicek (1981a) and the relevance of these ideas to supergravity theories has been discussed by Gibbons (1981). In the present report the author expands on these ideas a little and to describe in more detail the fermion zero mode structure. (13 refs.)

98926 Ultraviolet properties of supersymetric gauge theories. S.Ferrara (Theory Div., CERN, Geneva, Switzerland).
Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop, London, England, 3-21 Aug. 1981 (Cambridge, England: Cambridge 1982), p.323-35
Discusses the UV properties of N=1 supersymmetric Yang-Mills theories and then proceeds to look at N=1 to N=8 extended supergravities. (53 refs.)

98927 Duality rotations. B.Zumino (Dept. of Phys., Univ. of California, Berkeley, CA, USA).
Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop, London, England, 3-21 Aug. 1981 (Cambridge, England: Cambridge 1982), p.363-73
Discusses the properties of theories admitting duality rotations in connection with extended supergravity. (11 refs.)

04.80 EXPERIMENTAL TESTS OF GENERAL RELATIVITY AND OBSERVATIONS OF GRAVITATIONAL RADIATION

98928 Neutron interference: general theory of the influence of gravity, inertia and space-time torsion. J.Audretsch, C.Lammerzahl (Fakultat fur Phys., Univ. Konstanz, Konstanz, Germany).
J. Phys. A (GB), vol.16, no.11, p.2457-77 (1 Aug. 1983).
The general theory of the influence of gravity, inertia (i.e. interferometer motion) and space-time torsion on the outcome of neutron interference experiments is presented. The exact results are obtained in a general relativistic treatment based on the description of a stationary working interferometer in Riemann-Cartan space-time and on the WKB approximation for the neutron waves. Particular attention is paid to the influence on the spinor amplitude. There are two types of resulting amplitude effects; one originates in the non-integrability of the spinor connection and represents the influence of a modified Riemann-Cartan curvature; the other is caused by the influence of the interferometer rotation and acceleration and of space-time torsion during the time interval between the emission of the two coherent neutron waves. For practical purposes small effects are treated in an approximation. Two examples of a global evaluation of the expressions are given. Applications including a gravitational Aharonov-Bohm effect are discussed. (31 refs.)

98929 How to detect the gravitationally induced phase shift of electromagnetic waves by optical-fiber interferometry. K.Tanaka (Dept. of Electrical Engng., Gifu Univ., Gifu, Japan).
Phys. Rev. Lett. (USA), vol.51, no.5, p.378-80 (1 Aug. 1983).
Attention is called to a laboratory experiment of an optical-fiber interferometer which can show the gravitationally induced phase shift of optical waves. A phase shift of $\sim10^{-6}$ rad is anticipated for the Earth's gravitational potential difference of 1 m when a He-Ne laser and two multiple-turn optical-fiber loops of length 5 km are used. The phase shift can be varied by rotating the loops about an axis parallel to the Earth's surface. This order of phase shifts can be detected by current optical-fiber interferometric techniques. (10 refs.)

05.20 STATISTICAL MECHANICS

98930 One-dimensional hard rod caricature of hydrodynamics. C.Boldrighini (Istituto Matematico, Univ. di Camerino, Camerino, Italy), R.L.Dobrushin, Yu.M.Sukhov.
J. Stat. Phys. (USA), vol.31, no.3, p.577-616 (June 1983).
The authors give a rigorous deduction of the 'hydrodynamic' equation which holds in the hydrodynamic limit, for a model system of one-dimensional identical hard rods interacting through elastic collisions. The main result is the proof that if $\{P^\epsilon, \epsilon>0\}$ is a class of initial states which are homogeneous on a scale much less than ϵ^{-1}, and if the corresponding particle densities tend, as $\epsilon \rightarrow 0$, in the proper scale, to the initial hydrodynamic density $g_0(q, v)$, then, under some general assumptions on the states P^ϵ and on g_0, the particle densities of the evolved states at time $\epsilon^{-1}t$ tend as $\epsilon \rightarrow 0$ to the unique solution of the hydrodynamic equation with initial condition g_0. The proof is completed by exhibiting a large class of initial families $\{P^\epsilon, \epsilon>0\}$ which possess the required properties. (16 refs.)

98931 A note on the asymptotic master equations for systems with bound states. A.Di Prisco, G.Gutierrez (Dept. de Fisica, Univ. Central de Venezuela, Caracas, Venezuela).
J. Stat. Phys. (USA), vol.31, no.3, p.617-21 (June 1983).
It is shown that, within the convolutionless formalism of Fulinski (1978), the asymptotic form (in time) of the Liouville equation does not change with the existence of bound states in the energy spectrum of the system under consideration. (6 refs.)

98932 A new proof of the Stillinger-Lovett complete shielding condition. P.A.Martin, C.Gruber (Inst. de Phys. Theorique, Ecole Polytech. Federale, Lausanne, Switzerland).
J. Stat. Phys. (USA), vol.31, no.3, p.691-710 (June 1983).
It is shown that any equilibrium state of classical charged particles with correlation having a spatial decay faster than $1/|x|^{\nu+2}$ in dimension $\nu=2, 3$ obeys the Stillinger-Lovett second moment condition. Under the same clustering hypothesis, arbitrary localized external charge distributions are completely shielded. (17 refs.)

98933 Twenty-five years of the maximum-entropy principle. J.N.Kapur (Dept. of Math., Indian Inst. of Technol, Kanpur, India).
J. Math. & Phys. Sci. (India), vol.17, no.2, p.103-57 (April 1983). (Proceedings of the Conference on Mathematical Analysis and Applications, Madras, India, 12-13 Nov. 1982).
During the last twenty-five years the maximum-entropy principle has had very important applications in statistical mechanics, statistics, geography, spatial and urban structures, economics, marketing, systems analysis actuarial science, finance, computer science, spectrum analysis, pattern recognition, search theory, operations research, biological sciences, risk analysis and even in the analysis of deterministic systems. While in some areas it has been universally accepted as a great breakthrough, in others it has not been accepted by the Establishment and regarded as just another possible alternative approach, the use of which can be left to personal preferences of individual scientists. In the present survey both its strengths and weaknesses are examined and some challenging problems that remain outstanding at the end of the first quarter century of the principle are discussed. (141 refs.)

98934 Absence of long-range order above two dimensions. F.C.Alcaraz, L.Jacobs (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA), R.Savit.
Phys. Rev. Lett. (USA), vol.51, no.6, p.435-8 (8 Aug. 1983).
It is shown that a d-dimensional statistical system of a single U(1) variable, $\exp(i\phi)$, whose Hamiltonian is invariant under the transformation $\phi(x_1, \ldots, x_d) \rightarrow \phi(x_1, \ldots, x_d) + \Lambda(x_3, \ldots, x_d)$, with λ an arbitrary function, has no long-range order, so that $\langle \exp(i\phi) \rangle = 0$ for all nonzero temperatures. Moreover, the full planar symmetry reflected in the above transformation law is also unbroken for all $T>0$. When $d=2$ the usual Mermin-Wagner result is recovered. Various extensions and physical implications of this theorem are briefly discussed. (7 refs.)

98935 Statistical mechanics of cellular automata. S.Wolfram (Inst. for Advanced Study, Princeton, NJ, USA).
Rev. Mod. Phys. (USA), vol.55, no.3, p.601-44 (July 1983).
Cellular automata are used as simple mathematical models to investigate self-organization in statistical mechanics. A detailed analysis is given of 'elementary' cellular automata consisting of a sequence of sites with values 0 or 1 on a line, with each site evolving deterministically in discrete time steps according to definite rules involving the values of its nearest neighbors. With simple initial configurations, the cellular automata either tend to homogeneous states, or generate self-similar patterns with fractal dimensions $\simeq 1.59$ or $\simeq 1.69$. With 'random' initial configurations, the irreversible character of the cellular automaton evolution leads to several self-organization phenomena. Statistical properties of the structures generated are found to lie in two universality classes, independent of the details of the initial state or the cellular automaton rules. More complicated cellular automata are briefly considered, and connections with dynamical systems theory and the formal theory of computation are discussed. (184 refs.)

98936 Cluster expansion for ion-dipole systems. A.L.Rebenko (Inst. of Theoretical Phys., Acad. of Sci., Ukrainian SSR).
Theor. & Math. Phys. (USA), vol.53, no.3, p.1224-34 (Dec. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.3, p.429-43 (Dec. 1982).
The result of Brydges and Federbush (1980) is generalized to the case of ion-dipole systems of classical statistical mechanics. The author establishes more accurate values for the parameters for which there is convergence of these cluster expansions, and also establishes the existence and exponential clustering of the correlation functions for infinite volume. It is established that if the ion concentration is not equal to zero, not only the ion-ion but also the dipole-dipole interactions are screened. (16 refs.)

05.30 QUANTUM STATISTICAL MECHANICS

(see also 67. Quantum fluids, and 71. Electron states in condensed matter)

98937 The potential of zero charge of jellium. W.Schmickler (Inst. fur Phys. Chem., Univ. Dusseldorf, Dusseldorf, Germany).
Chem. Phys. Lett. (Netherlands), vol.99, no.2, p.135-9 (29 July 1983).
A model of the interface metal/electrolyte is presented in which the metal is represented as jellium, the solvent as an ensemble of dipoles. The potential of zero charge of the interface is calculated for various electronic densities of the jellium. The results are discussed with respect to experimental data. (13 refs.)

98938 Quantum statistical mechanics as a construction of an embedding scheme. O.Melsheimer (Fachbereich Phys., Philipps-Univ., Marburg, Germany).
Found. Phys. (USA), vol.13, no.7, p.745-58 (July 1983).
The author shows that the formalism of equilibrium quantum statistical mechanics can fully be incorporated into Ludwig's embedding scheme (1977, 1979, 1984) for classical theories in many-body quantum mechanics. A construction procedure based on a recently developed reconstruction procedure for the so-called macro-observable is presented which leads to the explicit determination of the set of classical ensembles compatible with the embedding scheme. (10 refs.)

98939 Sufficient conditions for convergence of antinormally ordered expansions of boson number operator functions $f(\hat{a}^+\hat{a})$. R.Baltin (Dept. of Theoretical Chem., Univ. of Ulm, Ulm, Germany).
J. Phys. A (GB), vol.16, no.12, p.2721-42 (21 Aug. 1983).
From previous work on ordering expansions of the boson number operator $\exp(-\mu\hat{a}^+\hat{a})$ formulae are derived for normally and antinormally ordered forms of arbitrary boson number operator functions $f(\hat{a}^+\hat{a})$ in terms of the Fourier transform $g(\lambda)$ of $f(x)$. When the antinormally ordered form $f^{(a)}(\hat{a}^+\hat{a})$ is applied to states belonging to the domain of definition of $f(\hat{a}^+\hat{a})$, the result differs in general from the action of $f(\hat{a}^+\hat{a})$ on these states or is not even defined. For the number operator eigenstates $|m\rangle$ two criteria are derived which give conditions on the Fourier transform $g(\lambda)$ ensuring validity of $f^{(a)}(\hat{a}^+\hat{a})|m\rangle = f(m)|m\rangle$. The general considerations are demonstrated by two examples for functions f. (23 refs.)

98940 On condensation in the free-boson gas and the spectrum of the Laplacian. M.van den Berg (Dublin Inst. for Advanced Studies, Dublin, Ireland).
J. Stat. Phys. (USA), vol.31, no.3, p.623-37 (June 1983).
The author proves the convergence of the thermodynamic functions of a free boson gas for a d-dimensional ($d=3, 4, \ldots$) van Hove sequence of convex regions. The thermodynamic functions behave singularly at a critical density ρ_c which is independent of the geometrical details of the sequence. One is led to define a second critical density ρ_m depending on the geometrical details of the sequence. For densities between ρ_c and ρ_m none of the single particle states is macroscopically occupied. The author derives a sufficient condition on the sequence such that $\rho_m = \rho_c$. (15 refs.)

98941 Are 2π rotations observable?. T.F.Jordan (Dept. of Phys., Univ. of Minnesota, Duluth, MN, USA).
Phys. Lett. A (Netherlands), vol.96A, no.9, p.457-9 (1 Aug. 1983).
Two beams of indistinguishable fermions from independent sources cannot produce an interference pattern that changes when the wavefunction of each single-fermion state for one beam is multiplied by -1; they cannot produce interference the way photons from independent sources can. This means the changes in neutron interference caused by magnetic field applied to one of the beams cannot be interpreted as equivalent to changes that could be made by rotating the source of one beam by 2π radians. If it is assumed that rotation by 2π radians cannot be observed, the argument made here becomes a simple proof that particles with half-integral spin cannot be bosons. (9 refs.)

98942 Charge displaced by a one-body potential in a fermion assembly in terms of the highest occupied state. K.A.Dawson, N.H.March (Dept. of Theoretical Chem., Univ. of Oxford, Oxford, England).
Phys. Lett. A (Netherlands), vol.96A, no.9, p.460-2 (1 Aug. 1983).
For (i) a slowly varying potential $V(r)$ in a Fermi gas and (ii) N particles moving in a linear harmonic-oscillator potential, the total displaced charge and the particle density are respectively written in terms of the highest occupied state. (8 refs.)

98943 A geometrical approach to Bose and Fermi statistics. L.P.Hughston (Lincoln Coll., Oxford, England), T.R.Hurd.
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.201-3 (28 July 1983).
The paper introduces a new approach to Bose and Fermi statistics, based on twistor theory. The authors treat the case of massless free fields, and show how 2-particle states (containing either two fermions or two bosons) can be characterised as sheaf cohomology elements on the space of pairs of symmetrised projective twistors. (12 refs.)

98944 Divergences and long-time tails in two- and three-dimensional quantum Lorentz gases. T.R.Kirkpatrick (Inst. for Phys. Sci. & Technol., Univ. of Maryland, College Park, MD, USA), J.R.Dorfman.
Phys. Rev. A (USA), vol.28, no.2, p.1022-46 (Aug. 1983).
The authors discuss divergences in the density expansion of the mobility of a quantum-mechanical particle moving in either two and three dimensions through a random array of hard-core scatterers. The most important divergences at low temperatures are of quantum-mechanical origin and involve the ratio of the de Broglie wavelength of the moving particle to its mean free path. When these divergent contributions are resummed they lead to both of the following: (1) logarithmic terms in the virial expansion of the mobility and (2) long-time tails in the integrand of the Green-Kubo formula for the mobility. In d dimensions for long-time tails have the form $-\alpha^{(d)}/t^{d/2}$, where $\alpha^{(d)}$ is a positive constant. For $d=2$, the long-time tail is not integrable and the implications of this are discussed. Similar results have been obtained by Abraham et al. (1980). For $d=3$, the long-time tails lead to corrections to the zero-frequency mobility of $O(\omega^{1/2})$, where ω is the frequency. This result should be detectable in electron-mobility experiments in gases at low temperatures. (33 refs.)

98945 Rotation generators in two-dimensional space and particles obeying unusual statistics. G.A.Goldin (Dept. of Phys., Princeton Univ., Princeton, NJ, USA), D.H.Sharp.
Phys. Rev. D (USA), vol.28, no.4, p.830-2 (15 Aug. 1983).
The authors describe systems of particles obeying unusual statistics in two-dimensional space, as well as solenoid-charged-particle composites, in terms of a complete set of local gauge-invariant currents. (16 refs.)

98946 Para-bosons and para-fermions in quantum mechanics. M.Cattani, N.C.Fernandes (Inst. de Fisica, Univ. de Sao Paulo, Sao Paulo, Brazil).
Rev. Bras. Fis. (Brazil), vol.12, no.4, p.585-98 (Dec. 1982).
The authors have performed, within the framework of the ordinary quantum mechanics, a detailed study of the energy eigenfunctions of N identical particles using the irreducible representations of the permutation group in the Hilbert space. The para-states, as with the boson and fermion states, are compatible with the postulates of quantum mechanics and with the principle of indistinguishability. The paper gives a mathematical support for the existence of para-bosons and para-fermions and justifies, in a certain sense, Gentile's quantum statistics (1942). (25 refs.)

98947 Gauge invariance in the strong coupling BCS-model. A.Rieckers (Inst. fur Theoretische Phys., Univ. Tubingen, Tubingen, Germany).
Group Theoretical Methods in Physics. Proceedings of the XI International Colloquium, Istanbul, Turkey, 23-28 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.546-8
The author describes some results of an ab initio treatment of the strong coupling BCS-model by means of C^*-algebraic methods which covers also single electron excitations. (3 refs.)

05.40 FLUCTUATION PHENOMENA, RANDOM PROCESSES, AND BROWNIAN MOTION

98948 Brownian motion in a system with plane or spherical symmetry and an elastic boundary: approximate solutions of the stationary Fokker-Planck equation. S.Waldenstrom, K.R.Naqvi, K.J.Mork.
Ark. Fys. Semin. Trondheim (Norway), no.8, p.1-62 (1983).
The stationary version of the generalized Fokker-Planck equation is presented for the cases of spherical and plane symmetry in terms of the coordinates entering the actual problem and with a view to stressing the similarity of the two geometries; it is shown that the same expression for the (velocity-space) Fokker-Planck operator applies in both cases and that eigenfunctions of this operator can be constructed by forming products of Legendre and generalized Laguerre polynomials. These equations are solved, within a common framework, by the method of moments, using full-range expansions (in eigenfunctions) of the distribution functions and Marshak-type boundary conditions to describe the situations in which the sphere at $r=R$ and the wall at $x=0$ are elastic (i.e. partially absorbing) boundaries. (21 refs.)

98949 The diffusion limit for reversible jump processes on Z^d with ergodic random bond conductivities. R.Kunnemann (Inst. fur Angewandte Math., Heidelberg, Germany).
Commun. Math. Phys. (Germany), vol.90, no.1, p.27-68 (1983).
Considers a reversible jump process on Z^d whose jump rates themselves are random. The author shows mean square convergence of this process under diffusion scaling to a limiting Brownian motion with a certain diffusion matrix, characterizing effective conductivity. (14 refs.)

98950 A formulation of quantum stochastic processes and some of its properties. K.-E.Hellwig, W.Stulpe (Inst. fur Theoretische Phys., Tech. Univ. Berlin, Berlin, Germany).
Found. Phys. (USA), vol.13, no.7, p.673-99 (July 1983).
Elements of discrete quantum stochastic processes which arise when the classical probability space is replaced by quantum theory have been considered by Hellwig (1981). The authors give a general formulation and its properties are compared with those of classical stochastic processes. It is considered whether such processes can be Markovian. An example is given and similarities to methods in quantum statistical thermodynamics are pointed out. (5 refs.)

98951 Quantum Brownian motion. H.Grabert, P.Talkner (Inst. fur Theoretische Phys., Univ. Basel, Basel, Switzerland).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.797-802 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
The authors propose a new master equation describing the irreversible process of a quantum-Mechanical Brownian particle. The master equation is shown to obey the symmetry of detailed balance leading to a quantum analogue of the reciprocity relations, and the fluctuation-dissipation theorem is obtained. The relation to previous approaches is discussed. (8 refs.)

98952 Scenarios for the onset of chaos. P.H.Coullet, C.Vanneste (Lab. de Phys. de la Matiere Condensee, Nice, France).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.813-23 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
The authors' aim is to give a simple and qualitative description of the transition to temporal chaos observed in experiments and dynamical systems. They present a classification of these routes according to the number of independent frequencies present just before the transition. Landau proposed a scenario in which the destabilization of an infinite number of independent frequencies would lead to turbulence. Ruelle, Takens and Newhouse (1971, 1978) showed that after the appearance of at most three independent frequencies in a given physical system, there exist arbitrary small deterministic perturbations which could give rise to chaotic behavior, described by some stable solutions of ordinary differential equations: the so called 'strange attractors'. The picture which emerges from this result seems to be compatible with experimental results and numerical simulations. This does not mean that the transition to chaos consists in a scenario where three frequencies necessarily appear. On the contrary, the transition has been observed many times after periodic and biperiodic states. The authors describe the one and two-frequencies scenarios with some details. The three frequencies cases are discussed in the conclusion. (29 refs.)

98953 Stability and relative stability in nonlinear driven systems. R.Landauer (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.847-61 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Fluctuation activated escape from a metastable state to a more likely state has been long been a subject of theoretical attention. The author illustrates the existing methods by application to noise induced errors in underdamped Josephson junction circuits. Concern with escape from the metastable state has been extended, during the last two decades, to include a concern with relative stability in open systems. The sophistication of some of the recent theories may have obscured the simpler and more important physical aspects which are reviewed. The author emphasizes the simplicity of transport in the most common one-dimensional situations. Two different forms for the diffusion current, $D\partial n/\partial x$ and $\partial(Dn)/\partial x$, commonly found in the literature, are discussed. The more likely of several competing locally stable states cannot be identified by simple criteria which are only concerned with the states being compared. The detailed kinetics along the pathways connecting such states, where the system is rarely found, cannot be ignored. As a consequence one cannot expect to discuss the origin of life, or evolution, by reliance on thermodynamic or information theoretic criteria, without attention to the detailed pathways for the process. (32 refs.)

98954 Microstructure of two-phase random media. II. The n-point matrix probability functions for fully penetrable spheres. S.Torquato (Dept. of Mech. & Aerospace Engng., North Carolina State Univ., Raleigh, NC, USA), G.Stell.
J. Chem. Phys. (USA), vol.79, no.3, p.1505-10 (1 Aug. 1983).
For pt.II, see ibid., vol.78, no.6, p.3262 (1983). The authors examine the n-point matrix probability functions S_n (which give the probability of finding n points in the matrix phase of a two-phase random medium), for a model in which the included material consists of fully penetrable spheres of equal diameter (i.e., a system of identical spheres such that their centers are randomly distributed in the matrix). Exploiting the special simplicity of the model they give an explicit closed-form expression for S_3 as well as sharp bounds on S_3 and S_4. sharp bounds on S_3 and S_4. on S_3 and their corresponding upper bound on S_4 satisfy certain asymptotic forms (for both small and large separation of points) that are satisfied by the exact S_3 spheres, even though the bounding properties of their expressionscan only be guaranteed for penetrable spheres. and S_4 for impenetrable as well as penetrable These expressions (and the resulting approximation for S_4 in terms of S_1 and S_2 obtained from them) are thus highly appropriate approximants for both systems to be used in composite-media transport-coefficient expressions that involve integrals over the S_n. The S_3 expression has in fact been suggested some time ago by Weissberg and Prager (1970); the authors' methods here provide further justification for this expression as well as one means of systematically generalizing it to S_n for higher n. (17 refs.)

98955 On the position-space renormalisation group approach to diffusion-limited cluster growth problems. M.Sahimi, G.R.Jerauld (Dept. of Chem. Engng. & Materials Sci., Univ. of Minnesota, Minneapolis, MN, USA).
J. Phys. A (GB), vol.16, no.12, p.L419-25 (21 Aug. 1983).
The authors investigate the application of position-space renormalisation group methods to the Witten-Sander (1981) model of diffusion-limited cluster growth. They show that this method cannot be used to investigate the asymptotic behaviour of the Witten-Sander model in three and higher dimensions, even though it yields satisfactory results in two dimensions with small cells. (24 refs.)

98956 On some Gaussian ensembles of Hermitian matrices. M.L.Mehta, A.Pandey (CENS, Gif-sur-Yvette, France).
J. Phys. A (GB), vol.16, no.12, p.2655-84 (21 Aug. 1983).
A Gaussian ensemble of Hermitian matrices with an arbitrary ratio of their symmetric and anti-symmetric parts is studied. Similarly a Gaussian ensemble of Hermitian quaternion matrices with an arbitrary ratio of their self-dual and anti-self-dual parts is studied. Analytical expressions for the correlation and cluster functions as well as their limits when the order of the matrices is large, are derived for both ensembles. (19 refs.)

98957 Scaling analysis for random walk properties on percolation clusters. J.C.Angles d'Auriac, R.Rammal (Centre de Recherches sur les Tres Basses Temperatures, CNRS, Grenoble, France).
J. Phys. C (GB), vol.16, no.23, p.L825-30 (20 Aug. 1983).
A scaling analysis for some random walk properties (range, renewal theory) on percolation clusters is outlined. Numerical simulations performed in the Bethe lattice case are in good agreement with the predictions of the scaling theory. The values $\tilde{d}={}^4/_3$ and $\bar{d}=4$ for the spectral and fractal dimensions are also confirmed. (7 refs.)

98958 The asymptotic evaluation of a class of path integrals. II.. J.M.Luttinger (Dept. of Phys., Columbia Univ., New York, NY, USA).
J. Math. Phys. (USA), vol.24, no.8, p.2070-3 (Aug. 1983).
For pt.I see ibid., vol.23, p.1011 (1982). The asymptotic behavior of a class of Wiener-like path integrals (functions of the 'local time') is determined. These integrals are of interest in themselves and also arise very naturally in the theory of disordered systems. The author shows that by making use of a Grassman algebra (i.e. a set of anticommuting variables), the earlier treatment of this problem can be greatly simplified. In particular, the previous use of 'replica trick' (which involves a difficult to justify analytic continuation in the number of field components) is thus avoided. (6 refs.)

98959 On the relation between white shot noise, Gaussian white noise, and the dichotomic Markov process. C.Van Den Broeck (Dept. Natuurkunde, Vrije Univ. Brussel, Brussel, Belgium).
J. Stat. Phys. (USA), vol.31, no.3, p.467-83 (June 1983).
It is shown that the dichotomic Markov process converges to a white shot noise (interpreted according to the Stratonovich integration rule) in the joint limit in which the average duration of one of the states goes to zero and the value at this state goes to infinity. A further limit procedure allows one to obtain Gaussian white noise from white shot noise. These results are applied to the problem of noise-induced transitions. It is shown that white shot noise can give rise to transitions which do not occur for Gaussian white noise. The above results are finally generalized in introducing compound dichotomic Markov processes. (14 refs.)

98960 What can we learn from homoclinic orbits in chaotic dynamics?. P.Gaspard, G.Nicolis (Faculte des Sci., Univ. Libre de Bruxelles, Bruxelles, Belgium).
J. Stat. Phys. (USA), vol.31, no.3, p.499-518 (June 1983).
State diagrams of two model systems involving three variables are constructed. The parameter dependence of different forms of complex nonperiodic behavior, and particularly of homoclinic orbits, is analyzed. It is shown that the onset of homoclinicity is reflected by deep changes in the qualitative behavior of the system. (15 refs.)

98961 Physical kinetics of quantum electrodynamic $(1/\omega)$-noise. A.Widom, G.Megaloudis (Dept. of Phys., Northeastern Univ., Boston, MA, USA), T.D.Clark, R.J.Prance.
Phys. Lett. A (Netherlands), vol.96A, no.9, p.449-50 (1 Aug. 1983).
The physical kinetics of soft photon emission in electronic quantum brownian motion is invoked to give a simple picture of the quantum electrodynamic sources of '$(1/\omega)$-noise' in conducting systems. (5 refs.)

98962 Stochastic motion of the propagating front in bistable media. A.S.Mikhailov, L.Schimansky-Geier, W.Ebeling (Sektion Phys., Humboldt-Univ. Berlin, Berlin, Germany).
Phys. Lett. A (Netherlands), vol.96A, no.9, p.453-6 (1 Aug. 1983).
The authors investigate the problem of front propagation in bistable media with fluctuating properties. The explicit formulas for the induced variations of the propagating speed and the dispersion of the front position are derived under the assumption that fluctuations in the properties of the medium are weak but can have arbitrary spatial and temporal correlation ranges. (8 refs.)

98963 Transition from quasi-periodicity to chaos in a system of coupled nonlinear oscillators. M.Sano, Y.Sawada (Res. Inst. of Electrical Communication, Tohoku Univ., Sendai, Japan).
Phys. Lett. A (Netherlands), vol.97A, no.3, p.73-6 (15 Aug. 1983).
The global bifurcation structure for a model of coupled nonlinear oscillators has been analysed numerically. It is shown that destruction of the two-torus preceding chaos is usually observed in this system. The critical surface of the invariant two-torus and its collapse in the course of rotation are firstly observed in a realistic differential equation system. A scaling property for the fine structure of phase-locking regions has also been confirmed. (17 refs.)

98964 Ito versus Stratonovich revisited [noise-induced phase transitions]. J.Smythe, F.Moss (Dept. of Phys., Univ. of Missouri-St. Louis, St. Louis, MO, USA), P.V.E.McClintock, D.Clarkson.
Phys. Lett. A (Netherlands), vol.97A, no.3, p.95-8 (15 Aug. 1983).
It is shown that a digital simulation of a noise induced phase transition using an algorithm consistent with the Ito stochastic calculus is in agreement with the prediction of that theory, whereas experiments with an analogue simulator yield measured results in agreement with the predictions of the Stratonovich theory. (9 refs.)

98965 Generalization of Baker's transformation—chaos and stochastic process on a Smale's horse-shoe. Y.Aizawa, C.Murakami (Dept. of Phys., Univ. of Kyoto, Kyoto, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.5, p.1416-26 (May 1983).
The area-preserving baker's transformation is extended in order to include the area nonpreserving one, which is the model for a simple horse-shoe structure. The random motion on the horse-shoe is studied precisely, and the invariant density and the correlation function are obtained analytically and numerically. The random walk on the horse-shoe structure is transformed into the generalization Brownian motion with the attractor, and the non-analytic density of the generalized baker's transformation is approximated by an analytic function. The topological similarity between the Lorenz chaos and the generalized baker's transformation is briefly discussed. (8 refs.)

98966 Transition from torus to chaos accompanied by frequency lockings with symmetry breaking—in connection with the coupled-logistic map. K.Kaneko (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.5, p.1427-42 (May 1983).
Transition from torus to chaos is studied using the coupled-logistic map. The author observes the period-adding sequence, which obeys the critical phenomena of a one-dimensional mapping. The fixed Lyapunov exponent is also obtained. The locking that appears after the sequence breaks the symmetry of the system. Self-similar stripe structure of basins is also found. Various properties and a phase diagram of the map are given. The mechanism of the distortion of torus and transition to chaos is also discussed. (23 refs.)

98967 Are three-frequency quasiperiodic orbits to be expected in typical nonlinear dynamical systems?. C.Grebogi, E.Ott, J.A.Yorke (Univ. of Maryland, College Park, MD, USA).
Phys. Rev. Lett. (USA), vol.51, no.5, p.339-42 (1 Aug. 1983).
The current state of theoretical understanding related to the question posed in the title is incomplete. This paper presents results of numerical experiments which are consistent with a positive answer. These results also bear on the problem of characterizing possible routes to chaos in nonlinear dynamical systems. (11 refs.)

98968 Microscopic derivation of the stochastic process for the quantum Brownian oscillator. P.Ruggiero (Istituto di Fisica, Univ. degli Studi di Salerno, Salerno, Italy), M.Zannetti.
Phys. Rev. A (USA), vol.28, no.2, p.987-93 (Aug. 1983).
The microscopic model of Ford et al. (1965) for the interaction of an oscillator with a thermal reservoir is considered within the framework of stochastic quantization. The process executed by the Brownian particle is derived exactly and it is analyzed in detail. The phenomenological equations for the dynamics of the quantum oscillator in the equilibrium state, which the authors have previously derived, and recovered as the weak coupling limit of the exact theory. (18 refs.)

98969 External noise and the dynamics of Ginzburg-Landau systems far from equilibrium. M.Kerszberg (Dept. of Phys., Harvard Univ., Cambridge, MA, USA).
Phys. Rev. A (USA), vol.28, no.2, p.1198-200 (Aug. 1983).
The dynamics of Ginzburg-Landau (or 'potential') systems driven away from equilibrium and subjected to noise is simulated numerically. It is found that the Fourier spectrum does not always have its peak at the wave number corresponding to the absolute minimum of the potential. This is explained heuristically on the basis of an entropy type of argument. (11 refs.)

98970 Functional renormalization-group theory of universal $1/f$ noise in dynamic systems. I.Procaccia, H.Schuster (Dept. of Chem. Phys. & Electronics, Weizmann Inst. of Sci., Rehovot, Israel).
Phys. Rev. A (USA), vol.28, no.2, p.1210-12 (Aug. 1983).
The functional renormalization group is used to show that a wide class of dynamical systems displays spectra with a $1/f^{\delta}$ divergence. Cutoffs introduced by stochastic or deterministic perturbations have universal features as well. Numerical support is presented. (12 refs.)

98971 Diffusion in concentrated lattice gases. V. Particles with repulsive nearest-neighbor interaction on the face-centered-cubic lattice. R.Kutner, K.Binder, K.W.Kehr (Inst. fur Festkorperforschung, KFA Julich, Julich, Germany).
Phys. Rev. B (USA), vol.28, no.4, p.1846-58 (15 Aug. 1983).
The diffusion of particles in concentrated lattice gases is studied by Monte Carlo methods, assuming a FCC lattice with repulsive nearest-neighbor interaction. Particular attention is paid to the influence of ordering on the diffusion properties, since the model has ordered superstructures at low temperatures T near the stoichiometric concentrations $c={}^1/_4$, ${}^1/_2$, and ${}^3/_4$. Both the self-diffusion of tagged particles and the collective diffusion by which concentration fluctuations decay are obtained. In the ordered regions both diffusivities are rather small due to a strong decrease of the effective jump rate of the particles. The correlation factor $f(T,c)$ for self-diffusion has a pronounced nonmonotonic concentration dependence for low temperatures. This is interpreted by reducing the problem near $T=0$ and the limits $c \to {}^1/_4-$, ${}^1/_2-$ to an effective single-vacancy problem, and $c \to {}^1/_4+$, ${}^1/_2+$ to an effective single-particle problem. Other lattices are briefly discussed. (38 refs.)

98972 Correlators of processes in very simple systems with strange attractors. R.L.Stratonovich (M.V. Lomonosov State Univ., Moscow, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.942-4 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.355-9 (Nov. 1982).
Systems with strange attractors have recently aroused great interest among physicists. A large number of systems with stochastic behavior have now been described. The statistical properties of processes are calculated or estimated analytically. The goal is to determine correlators for several very simple particular cases. (7 refs.)

98973 Some ideas about strange attractors. L.Garrido (Univ. de Barcelona, Barcelona, Spain), C.Simo.
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.1-28
The authors give a working definition of strange attractors, some results about their origin, structure and several examples. They also provide a survey of types of attractors. (221 refs.)

98974 Chaotic dynamics in Hamiltonian systems with divided phase space. B.V.Chirikov (Inst. of Nuclear Phys., Novosibirsk, USSR).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.29-46
The subject of this lecture is related to a peculiar dynamical phenomenon in classical mechanics commonly termed among physicists as the chaotic, or stochastic, motion. (27 refs.)

98975 Periodic and quasi-periodic orbits for twist maps. A.Katok (Dept. of Math., Univ. of Maryland, College Park, MD, USA).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.47-65
The author presents a motivation for and a survey of recent results which in a certain sense fill the gap between the classical work of G.D. Birkhoff (1950) on periodic orbits for mechanical systems with two degrees of freedom and celebrated KAM theory which deals with the existence of invariant tori for small perturbations of integrable Hamiltonian systems. (28 refs.)

98976 Marcroscopic behavior in a simple chaotic Hamiltonian system. O.E.Rossler (Inst. for Phys. & Theoretical Chem., Univ. of Tubingen, Tubingen, Germany).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.67-77
Nonlinear Hamiltonian systems of only two degrees of freedom readily produce complicated Poincare-type (or, synonymously, chaotic) behavior. Nonlinear Hamiltonian systems of many degrees of freedom, on the other hand, produce not only chaos but also modulate systematic motions (so-called dissipative structures). A two-degrees-of-freedom system is described which shows two types of 'macroscopic' behavior. On one hand, there is a 'main regime' which is characterized by a random distribution of both positional variables. From this 'equilibrium' the system only very rarely departs once it has come close to it. On the other hand, when the system is started sufficiently far away, it spends a certain time in a characteristic 'transient regime' which too (like the main regime) is the same for both time directions. One of the two particles hereby shows a statistical directional preference. This preference is the same as when the system is run as an open system ('temporarily open regime'). The simple nature of the system encourages further quantitative and qualitative investigations. (15 refs.)

98977 A universal transition from quasi-periodicity to chaos. E.D.Siggia (Lab. of Atomic & Solid State Phys., Cornell Univ., Ithaca, NY, USA).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.91-2
A common route to chaos in dissipative systems proceeds from periodic to quasi-periodic flow (with two independent frequencies). Then, in the absence of rotational symmetry, the system generally mode locks before becoming turbulent. Beyond these qualitative features, the numerous experiments that have examined this regime differ in detail. Dynamical system theory had made the occurrence of the above transitions plausible but has provided no non-trivial quantitative and model independent information. This situation, on the theoretical side, has recently changed with a proposal on how to modify the experiments so as to make the transition to chaos occur in a quantitatively universal manner. The essence of the proposal follows from KAM theory which is the weak coupling limit of the strong coupling problem relevant to the turbulent transition. In addition to the Rayleigh number, the experimenter must control a second parameter so as to maintain the frequency ratio in the quasi-periodic state at a fixed irrational value. The golden mean, $(\sqrt{5}-1)/2$, is the optimal ratio experimentally. (2 refs.)

98978 Self-generated diffusion and universal critical properties in chaotic systems. T.Geisel, J.Nierwetberg (Inst. fur Theoretische Phys., Univ. Regensburg, Regensburg, Germany).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.93-114
Reviews the universal critical properties exhibited by some 1d discreted dynamical systems: period-doubling systems and systems generating diffusive motion. While the period-doubling bifurcations have the universal asymptotic bifurcation rate $\delta=4.6692...$, the tangent bifurcations present within the chaotic region do not follow this rate. The authors show that the tangent bifurcations giving rise to a fine structure of periodic windows have bifurcation rates γ_k which can be calculated analytically. They converge to a universal constant $\gamma=2.94805...$ The authors have found that a class of dynamical systems show the onset of a diffusive motion in addition to period-doubling. The diffusion is self-generated and does not rely on the presence of random external forces. The onset of diffusion has strong analogies with a phase-transition. The diffusion coefficient is the order parameter and has a universal critical exponent. The dependence on random external fluctuations is also universal and can be expressed in terms of a universal scaling function which is calculated analytically. (16 refs.)

98979 Subharmonics and the transition to chaos. J.Rudnick (Dept. of Phys., Univ. of California, Santa Cruz, CA, USA).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.115-29
The author looks at a system having both simple and complex subharmonic response, the parametrically driven pendulum. The behavior of this pendulum is formulated in terms of a two-dimensional map. Some simple properties of the map will be investigated and others will be pointed to. Then he considers the spectral signature of period doubling and the structure of the invariant map and its compositions at the accumulation point of the period doubling cascade. (25 refs.)

98980 Low dimensional dynamics and the period doubling scenario. M.Feigenbaum (Lab. of Atomic & Solid State Phys., Cornell Univ., Ithaca, NY, USA).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.131-48
A strategy has been developed to quantitatively determine the nature of the onset of chaotic motion in deterministic systems. This strategy incorporates two main ingredients. The first is a serious consequence of dissipation—in general only dissipative systems are to be considered. The special role of dissipation is that although the systems considered generally possess a large or infinite number of degrees of freedoms, the onset regime is characterized by the excitation of only a few of them. Thus, there exists an effective model of the system in this regime much simpler than the basic local description. The other main ingredient is that a scaling phenomenon for these systems, near the transition to chaos, is governed by a renormalization group theory, so that any low modal model in the same universality class serves as an appropriate model to determine quantitative properties of the actual system. Thus, a general class of one dimensional discrete-time models serves to determine the onset behavior of some real fluid configurations. (no refs.)

98981 Entropy and smooth dynamics. S.E.Newhouse (Dept. of Math., Univ. of North Carolina, Chapel Hill, NC, USA).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.165-79
It is a matter of common experience that simple nonlinear differential equations often have many solutions which exhibit complicated and erratic time dependence. For low dimensional systems there has recently been considerable progress made on the problem of describing such motion. This gives one optimism for understanding physical systems whose principal qualities can be described by a small number of modes. (20 refs.)

98982 Imbedding of a one-dimensional endomorphism into a two-dimensional diffeomorphism. Implications. C.Mira (INSA, Toulouse, France).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.180-7
This paper considers the properties of the diffeomorphism T_b, $x_{n+1}=y_n+f(x_n,a)$, $y_{n+1}=bx_n$, $n=0, 1, 2, \ldots$ x, y, being real variables, a, b, real parameters, in relation with those of the endomorphism T_o: $x_{n+1}=f(x_n,a)$ T_b has a constant Jacobian $J=-b$. For $b=0$, $n=1, 2, 3, \ldots$, the sequence of points, the solutions are identical. (15 refs.)

98983 Strange attractors for differential delay equations. C.Simo (Facultat de Matematiques, Univ. de Barcelona, Barcelona, Spain).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.188-91 (10 refs.)

98984 Stochastic perturbations of some strange attractors. G.Keller (Inst. fur Angewandte Math., Univ. Heidelberg, Heidelberg, Germany).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.192-3
For a class of 2-dimensional, time-discrete dynamical systems including generalized Baker's transformations and similar mapping the author shows that the asymptotic measure has an exponential mixing rate and is stable under small stochastic perturbations. The approximation of arbitrary systems by Markov systems is a special case. (9 refs.)

98985 Solutions of stochastic differential equations and fractal trajectories. B.J.West (La Jolla Inst., La Jolla, CA, USA).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.194-203 (21 refs.)

98986 On the characterization of chaotic motions. I.Procaccia, P.Grassberger, H.G.E.Hentschel (Dept. of Chem. Phys., Weizmann Inst. of Sci., Rehovot, Israel).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.212-22
The authors demonstrate that scaling ideas and fractal statistics can be very useful in dealing with chaotic motions. In particular they concentrate on two topics. The characterization of strange attractors. They offer a method of analyzing and characterizing chaotic experimental signals which stem from motions on strange attractors. The method can distinguish between these and random 'noisy' signals, and can be applied also to very high (or infinite) dimensional systems which possess lower dimensional attractors. The assessment of the fractal nature of fully developed turbulence. It is shown how ideas similar to those treated in part 1 can be applied to the important process of turbulent diffusion, and how to infer from it the fractal dimension of fluid turbulence. (21 refs.)

98987 Complex bifurcations in a periodically forced normal form. C.Baesens (Univ. Libre de Bruxelles, Bruxelles, Belgium).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.223-4
The author shows that in certain classes of systems controlled by two parameters, chaotic motion can be viewed as a local problem both in parameter and in phase space. (5 refs.)

98988 Topological entropy and scaling behaviour. J.Dias de Deus, R.Dilao, J.Taborda Duarte (Centro de Fisica da Materia Condensada, Lisboa, Portugal).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.225-6
In one dimensional maps $f_\mu:[-1,1]$ with fixed end points and depending monotonically on $\mu\epsilon[0,1]$, the growth number (GN) A takes the constant value 1 in the first Feigenbaum region and values between 1 and 2 in the chaotic region, $\mu\epsilon[\mu_\infty,1]$. The authors analyze the behaviour of the GN and of the topological entropy (TE) h in $[\mu_\infty,1]$. (3 refs.)

98989 On the analytic structure of chaos in dynamical systems. T.Bountis (Dept. of Math. & Computer Sci., Clarkson Coll. of Technol., Potsdam, NY, USA).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.227-36
A number of new and exciting results on the chaotic properties of dynamical systems have been recently obtained by studying their movable singularities in the complex time plane. New, integrable systems were indentified by requiring that their solutions admit only poles. Allowing for logarithmic singularities, it has been possible to distinguish between 'strongly' and 'weakly' chaotic Hamiltonian systems, while in some cases natural boundaries with self-similar structure have been found. The analysis is direct, widely applicable and is illustrated here on some simple examples. (36 refs.)

98990 Type-III-intermittency in a smooth perturbation of the logistic system. G.Mayer-Kress, H.Haken (Inst. fur Theoretische Phys., Univ. Stuttgart, Stuttgart, Germany).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.237-8
The authors introduce a two-parameter family of convex maps, which acts as a smooth perturbation of the logistic parabola and for which the Schwarzian derivative can become positive. It is given by: $f_{r,b}(x):=32rx(1-x)(1+bx(1-3x+2(2-x)x^2))/(b+8)$ where r is the value of $f_{r,b}$ at its critical value x_c and b measures the perturbation of the logistic parabola $f_{r,0}$. For this system they additionally observe type-III-intermittency, where a flip-bifurcation of a fixed point is not followed by a doubling of the period, but by a transition to a chaotic attractor, which contains the unstable fixed-point. (11 refs.)

98991 Irreversible evolution of dynamical systems. S.Martinez, E.Tirapegui (Facultad de Ciencias Fisicas y Matematicas, Univ. de Chile, Santiago, Chile).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.239-44
Following some basic ideas of the theory of irreversibility of Prigogine et al. (1973) the group of Brussels has recently developed a canonical method to associate a Markov process 'equivalent' to the reversible evolution of certain dynamical systems exhibiting intrinsic randomness. The authors study this process working for simplicity with the Baker transformation. (5 refs.)

98992 Homoclinic and heteroclinic points in the Henon map. G.Gomez (Univ. Autonoma de Barcelona, Barcelona, Spain), C.Simo.
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.245-7
This communication is devoted to study the role of the homoclinic and heteroclinic points of the Henon mapping in order to explain the capture escape boundary for the Henon attractor previously studied numerically by Hitzl (1981). (3 refs.)

98993 The simple periodic orbits in the unimodal maps. L.Alseda (Dept. de Teoria Economica, Univ. Autonoma de Barcelona, Barcelona, Spain), R.Serra.
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.248-9 (7 refs.)

98994 Modulation properties in decaying processes of the correlation in a family of 1-D maps. T.Nagashima (Inst. fur Theoretische Phys., Univ. Stuttgart, Stuttgart, Germany).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.250-1
Since the work of Ruelle-Takens (1971) on turbulence generation properties of the correlation function in dynamical systems have received a great concern. The author gives an exact analysis of the correlation function for a certain family of 1-D maps. (3 refs.)

98995 Relaxation times and randomness for a nonlinear classical system. M.Casartelli (Istituto di Fisica, Univ. di Parma, Parma, Italy).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.252-3
The author describes numerical experiments on a classial nonlinear system possessing a stochastic transition, showing that a 'memory' of the ordered region survives in the stochastic region, and can be revealed through the analysis of the relaxation times. (3 refs.)

98996 Anharmonic systems in external periodic fields with chaotic behaviour. W.-H.Steeb, A.Kunick, W.Erig (Univ. Paderborn, Paderborn, Germany).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.260-1
The authors investigate the chaotic behaviour of the equations for the potential $V(x)=-\beta\cos x$, where $\beta>0$. They mention that the limiting case where $f=\alpha=0$ is the completely integrable equation of the pendulum. Whether or not chaotic behaviour occurs depends on the parameters f, Ω, α, and β. There are several possibilities to characterize the chaotic state (decay of the autocorrelation functions, one-dimensional Lyapunov exponent, Poincare mapping, Hausdorff dimension and so on). They apply the one-dimensional Lyapunov exponent. If the one-dimensional Lyapunov exponent is positive, then chaotic behaviour is indicated. (no refs.)

98997 The second order Melnikov integral applied to detect quasi-randomness. A.Aubanell (Facultat de Matematiques, Univ. de Barcelona, Barcelona, Spain).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.266-7
The crossing of invariant manifolds in a dynamical system allows use to consider the Bernoulli Shift as a subsystem, and as a consequence, to have quasi-randomness. The Melnikov integral (which the author calls of first order: FOMI) was used by Holmes and Marsden, Mallet-Paret, Chow, Hale, etc., in order to detect quasi-randomness. In some cases this information cannot be obtained from the FOMI. The author introduces the second order (and higher order if necessary) Melnikov Integral to study these problems. (5 refs.)

98998 The Fokker-Planck equation as a dynamical system. A.Munoz Sudupe, R.F.Alvarez-Estrada (Dept. Fisica Teorica, Univ. Complutense, Madrid, Spain).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.268-9 10 3
In dealing with nonequilibrium Statistical Mechanics it is useful to consider, as starting point, the phenomenological stochastic equations of the Langevin or Fokker-Planck types. In order to understand the properties of such dynamical equations, it is quite natural to use, in analogy with statics, the path integral formalism and field-theory techniques. Up to now the most extended formalism is the one introduced by Martin, Siggia and Rose (1973) (MSR) which has been applied with good results by various authors. The authors present an alternative formulationwhich seems more powerful not only in perturbative calculations but also regarding rigorous results. (3 refs.)

98999 Feasibility of calculating dimension and topological entropy. T.Pignataro (Joseph Henry Lab. of Phys., Princeton Univ., Princeton, NJ, USA).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.287-9
Presented here is a summary of some previous work on the application, to several numerical models displaying chaos, of an algorithm suggested by Takens (1981) to calculate the capacity of attractors from the time series of a single observable, the description of some new preliminary results on using the algorithm to calculate topological entropy. (5 refs.)

99000 Non-linear mechanics of a string in a viscous noisy environment. W.G.Faris (Dept. of Math., Univ. of Arizona, Tucson, AZ, USA), G.Jona-Lasinio.
Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981, Freiburg, Germany, 31 Aug.-11 Sept. 1981 (New York, USA: Plenum 1983), p.171-8
Stochastic partial differential equations constitute a relatively new subject. There have been a number of interesting papers in the last few years, but the field is still in its infancy if compared with the highly developed theory of stochastic ordinary differential equations. The authors report on a study of a nonlinear heat equation in a finite interval of space subject to a white noise forcing term. Due to the nonlinearity the equation, without the forcing term, exhibits several equilibrium configurations two of which are stable, actually asymptotically stable. The solution of the complete forced equation is a stochastic process in space and time with continuous sample paths whose behaviour is studied in the limit of small noise. The authors obtain lower and upper bounds for the probability of large fluctuations and then apply their estimates to the calculation of the transition probability between the stable configurations (tunneling). 05.50 LATTICE THEORY AND STATISTICS; ISING PROBLEMS

(see also 75.10H Ising models)

99001 Coherent memory functions for finite molecular systems. A direct method of calculation. I.Barvik, V.Szocs (Inst. of Phys., Charles Univ., Praha, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.7, p.802-9 (1983).
A new direct method for calculation of coherent memory functions (MFs) entering the Nakajima-Zwanzig (or GME) equation is presented for rigid molecular chains with natural boundary conditions. The method is illustrated on chains with three and five molecules and various kinds of imperfections. Obtained results imply a necessity of a more careful interpretation of experimental data (e.g. diffusivity). (5 refs.)

99002 Correlation functions of the transverse Ising chain at the critical field for large temporal and spatial separations. B.M.McCoy, J.H.H.Perk, R.E.Shrock (Inst. for Theoretical Phys., State Univ. of New York, Stony Brook, NY, USA).
Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands), vol.B220(FS8), no.3, p.269-82 (25 July 1983).
The authors study the behavior of $\langle\sigma_0{}^x(t)\sigma_n{}^x(0)\rangle$ and $\langle\sigma_0{}^y(t)\sigma_n{}^y(0)\rangle$ for the transverse Ising chain at the critical magnetic field at $T=0$. Explicit results are obtained for the three distinct regions where $t\rightarrow\infty$ and $n\rightarrow\infty$ with $0\leq n/t<1$, $1<n/t$, or $t=n+n^{1/3}\ (z/2)$ where z is fixed of order one. In this latter region the general Painleve V solution is shown to reduce to a Painleve II function. They use their results to discuss the general problem of long-time behavior of Toda equations with slowly decaying initial values. (15 refs.)

99003 Stability of acoustic and optical solitons in a diatomic chain. S.Pnevmatikos, M.Remoissenet (Univ. of Dijon, Dijon, France), N.Flytzanis.
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.569-74 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
The authors study the propagation of solitons of the compressive and rarefactive type in nonlinear atomic chains, i.e. they look for permanent profile solutions that preserve their form under collisions (except for a possible phase shift) or they are long lived. For interatomic potentials that can be expanded in a Taylor series in the relative atomic displacements (keep the first few terms) approximate analytic results can be combined with computer experiments if they consider smoothly varying waves. (10 refs.)

99004 Monte Carlo methods for quantum lattice models. H.De Raedt (Dept. of Phys., Univ. of Antwerp, Wilrijk, Belgium), A.Lagendijk.
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.593-603 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
The authors discuss a Monte Carlo technique to calculate the thermodynamic properties of quantum lattice models. They use Suzuki's generalized Trotter formula to reformulate the problem in terms of path integrals. Applications treated in detail include the influence of quantum fluctuations on the generalized 1-dimensional classical Wigner lattices introduced by Hubbard and super-localization in Holstein's 1-, 2- and 3-dimensional molecular crystal model. (30 refs.)

99005 A new type of cluster expansion and time-dependent adiabatic perturbation theory on finite and infinite lattices. W.J.Briels (Inst. of Theoretical Chem., Univ. of Nijmegen, Nijmegen, Netherlands).
J. Chem. Phys. (USA), vol.79, no.2, p.969-75 (15 July 1983).
A new type of cluster expansion is proposed, which is used to calculate the properties of the lower part of the spectrum of a general lattice Hamiltonian. The method does not involve power series in the number of lattice sites. Surface effects are easily incorporated into the theory in a natural way. Application to the 1-*d* Ising model in a transverse magnetic field demonstrates that good results can be obtained with moderate computational effort. (18 refs.)

99006 A microscopic model for ordered chain systems. A.Baram, I.Goldhirsch (Dept. of Chem. Phys., Weizmann Inst. of Sci., Rehovot, Israel).
J. Chem. Phys. (USA), vol.79, no.2, p.992-6 (15 July 1983).
A microscopic model for a system of ordered chains is presented. The statistics of a single chain is calculated in a quadratic mean field potential that approximates the steric repulsions between the hydrocarbon chains. The partition function of the problem that contains long range interaction between segments, is transformed to a mathematically tractable Markovian form. Statistical averages and correlations are calculated showing a constant chain alignment near the interface that decays only towards the end of the chain. (30 refs.)

99007 Critical exponents of directed self-avoiding walks. J.L.Cardy (Dept. of Phys., Univ. of California, Santa Barbara, CA, USA).
J. Phys. A (GB), vol.16, no.11, p.L355-7 (1 Aug. 1983).
It is argued that directed self-avoiding random walks are in the same universality class as directed unrestricted random walks, and therefore should exhibit mean-field exponents $\gamma=1$, $\nu_\parallel=1$, $\nu_\perp={}^1/_2$ in all dimensionalities. (4 refs.)

99008 On the critical exponent γ for four common three-dimensional lattices. J.L.Gammel, D.C.Power (Dept. of Phys., Saint Louis Univ., St. Louis, MD, USA).
J. Phys. A (GB), vol.16, no.11, p.L359-63 (1 Aug. 1983).
The rational approximation method is used to examine the critical exponent for the susceptibility in the $S={}^1/_2$ Ising model on the face centred cubic (FCC), body centred cubic (BCC), simple cubic (SC) and diamond lattices. A variation of the method of critical point renormalisation is used to eliminate bias due to uncertainty in the location of the critical point. The results are in agreement with the renormalisation group and with recent series analysis of the BCC series. (13 refs.)

99009 Field theoretic approaches to biconnectedness in percolating systems. A.B.Harris (Schlumberger-Doll Res., Ridgefield, CT, USA), T.C.Lubensky.
J. Phys. A (GB), vol.16, no.11, p.L365-73 (1 Aug. 1983).
Two field theoretic formulations for the percolation problem are presented from which the critical exponents describing the 'backbone' of the infinite cluster at the percolation threshold are obtained. At high spatial dimension, d, the order-parameter exponent for the backbone $\beta^{(2)}$ is given by $\beta^{(2)}=2\beta+\psi^{(2)}\nu$, where β is the critical exponent for the density of the infinite cluster and $\psi^{(2)}$ is a new crossover exponent. In mean-field theory $\psi^{(2)}=0$ and for $d=6-\epsilon$, $\psi^{(2)}=2\epsilon^2/49+O(\epsilon^3)$. Presumably, $\psi^{(2)}(d)$ is a smooth function of d for $d>d^*$, where numerical and theoretical work indicates that d^* is about 3. The result indicates that the fractal dimensionality of the backbone is given in terms of the percolation exponents as γ/ν-$\psi^{(2)}$. (27 refs.)

99010 Real-space renormalisation group study of selective site percolation on triangular lattice. T.Idogaki, N.Uryu (Dept. of Appl. Sci., Kyushu Univ., Fukuoka, Japan).
J. Phys. A (GB), vol.16, no.11, p.2501-14 (1 Aug. 1983).
The selective site percolation is studied on three kinds of triangular lattice, TC, TK and TH lattices, by using renormalisation groups. The recursion relations on occupation probabilities are solved to give global phase diagrams with scaling factor $b=\sqrt{3}$, 2 and 3 for the TC lattice, and with $b=\sqrt{3}$ and $\sqrt{7}$ for TK and TH lattices respectively. The phase boundaries are obtained correctly with the flow direction towards a single isotropic fixed point. This result is in accordance with the anisotropic bond result and consistent with the universality hypothesis. In the extreme anisotropy limit of site preference, these boundaries give good estimates of the critical concentration p_c of chain, Kagome and honeycomb lattices. Especially, in the chain limit for the TC lattice, the critical exponents of both the correlation length $\nu=1$ and the dimensionality crossover $\phi=1$ are reproduced exactly. The dependence of total p_c on site selectivity is also discussed. (30 refs.)

99011 A long-range Domany-Kinzel model of directed percolation. T.C.Li, Z.Q.Zhang (Inst. of Phys., Chinese Acad. of Sci., Beijing, China).
J. Phys. A (GB), vol.16, no.12, p.L401-6 (21 Aug. 1983).
A long-range Domany-Kinzel (1981) model proposed by Wu and Stanley (1982) is solved using random-walk formulations. In this model, for every site (i,j) in a two-dimensional lattice there is a directed bond present from site (i,j) to $(i+1,j)$ with probability one. There are also $m+1$ directed bonds present from (i,j) to $(i-k,\ j+1)$, $k=-1,\ 0,\ 1,\ 2,\ 3\ldots m-1$ with respective probabilities p_{k+1} where m is any positive integer. An exact expression is obtained to determine the critical percolation angle θ_c for any distribution of p_n. The system percolates in the region $\theta_c>\theta\geq0$ with probability one and zero outside this region where θ is the angle measured from the x axis. If the authors let m go to infinity and p_n varies as p_1n^{-s}, they find that when $s\leq2$,

$\theta_c=\pi$. A closed form expression of θ_c is obtained for $s\gtrsim 2$. When m is large but finite, θ_c is also obtained for the following two distributions: (a) $p_n=a/(a+n)$ with $a>0$, (b) $p_n=\beta/m$ and $\beta>0$. (16 refs.)

99012 Duality on planar fractal and hierarchical lattices. J.R.Melrose (Dept. of Phys., Univ. Coll. Cardiff, Cardiff, Wales).
J. Phys. A (GB), vol.16, no.12, p.L407-11 (21 Aug. 1983).
Duality constructions are presented for the classes of planar fractal and hierarchical lattices. Interesting results include the interpretation of dual Sierpinski gasket and carpets as fractal domain models, that the constructions take a lattice, L, with intrinsic dimension D and connectivity Q to a dual, $\tilde{L}$, with $\tilde{D}=D/Q$ and $\tilde{Q}=1/Q$, and a novel, but trivial, dual for the one-dimensional lattice. (16 refs.)

99013 Time continuous limit for the Baxter model. V.Libero, J.R.Drugowich de Felicio (Dept. de Fisica e Ciencia dos Materiais, Inst. de Fisica e Quimica de Sao Carlos, Sao Carlos, Brazil).
J. Phys. A (GB), vol.16, no.12, p.L413-17 (21 Aug. 1983).
The authors obtain the associated Hamiltonian for the symmetric eight-vertex model by taking the time-continuous limit in an equivalent Ashkin-Teller (1943) model. The result is a Heisenberg Hamiltonian with coefficients J_x, J_y and J_z identical to those found by Sutherland (1970) for choices of the parameters a, b, c and d that bring the model close to the transition. The change in the operators is accomplished explicitly, the relation between the crossover operator for the Ashkin-Teller model and the energy operator for the eight-vertex model being obtained in a transparent form. (12 refs.)

99014 Singular behaviour of certain infinite products of random 2×2 matrices. B.Derrida, H.J.Hilhorst (CENS, Gif-sur-Yvette, France).
J. Phys. A (GB), vol.16, no.12, p.2641-54 (21 Aug. 1983).
The authors consider an infinite product of random matrices which appears in several physical problems, in particular the Ising chain in a random field. The random matrices depend analytically on a parameter ϵ in such a way that for $\epsilon=0$ they all commute. Under certain conditions they find that the Lyapunov index of this product behaves approximately as $C\epsilon^{2\alpha}$ for $\epsilon\rightarrow 0$. Their approach is based on the decomposition of an exact integral equation for this problem into two reduced equations. They give an expression for the exponent α in terms of the probability distribution of the matrices, and for the proportionality constant C in terms of the solutions of the reduced integral equations. In cases where exact results are available, agreement is obtained. The physical consequences for disordered one-dimensional systems are pointed out. (15 refs.)

99015 The percolation of fibres with random orientations: a Monte Carlo study. J.Boissonade, F.Barreau, F.Carmona (Centre de Recherche Paul Pascal, Domaine Univ., Talence, France).
J. Phys. A (GB), vol.16, no.12, p.2777-87 (21 Aug. 1983).
Monte Carlo numerical simulations of the percolation of sticks with random orientations on a cubic lattice are reported. Finite size scaling and the position space renormalisation group are used. As the length of the sticks is increased it is found that the critical probability decreases whereas the correlation length exponent remains, within experimental errors, the same as in classical 3D percolation. Comparison with previous experimental and numerical results on related systems leads to the emphasis of the importance of the excluded-volume condition. (27 refs.)

99016 Interface properties of the two-dimensional Blume-Emery-Griffiths model. W.Selke (Inst. fur Festkorperforschung, KFA Julich, Julich, Germany), J.Yeomans.
J. Phys. A (GB), vol.16, no.12, p.2789-800 (21 Aug. 1983).
The authors study the interface behaviour of the two-dimensional Blume-Emery-Griffiths model (1971) which is described by the Hamiltonian $H=-J\Sigma_{\langle ij\rangle}S_iS_j=K\Sigma_{\langle ij\rangle}S_i^2S_j\ ^2+D\Sigma_iS_i^2$ $S_i=1,\ 0,\ -1$. An interface is introduced into the system by fixing the spins on opposite boundaries in two different states, +1 and −1. They pay particular attention to the appearance of an excess of the third state, 0, in the vicinity of the interface. The net adsorption of the non-boundary state is studied near critical, first-order and tricritical transitions. Two methods have been used to attack this problem, the Monte Carlo technique and a modified version of the interface free energy approximation of Muller-Hartmann and Zittartz (1977) which is seen to give a surprisingly good description of interface properties in three-state systems. (31 refs.)

99017 The asymptotic behaviour of directed self-avoiding walks. A.M.Szpilka (Baker Lab., Cornell Univ., Ithaca, NY, USA).
J. Phys. A (GB), vol.16, no.12, p.2883-5 (21 Aug. 1983).
Chakrabarti and Manna (1983) have made a numerical study of 'directed' self-avoiding walks on a square lattice, in which the random walker is forbidden to move upward: extrapolating from an enumeration of N-step walks up to $N=14$, they claimed that the mean end-to-end displacement, R_N, behaves asymptotically for large N as N^{ν} with $\nu=0.86\pm0.02$. It is shown that a simple application of the generating function method yields the behaviour of N-step walks of this type exactly (for all N), and the result $\nu=1$ is rigorously proved. (4 refs.)

99018 The falsity of a conjecture concerning the percolation threshold. A.B.Harris (Schlumberger-Doll Res., Ridgefield, CT, USA).
J. Phys. A (GB), vol.16, no.12, p.2887-8 (21 Aug. 1983).
A recent conjecture relating the critical concentration for bond percolation and a lattice Green function is shown to be false. (2 refs.)

99019 Phenomenological renormalisation group through the moments of the pair correlation function. M.J.de Oliveira (Inst. de Fisica, Univ. de Sao Paulo, Sao Paulo, Brazil).
J. Phys. C (GB), vol.16, no.23, p.L853-5 (20 Aug. 1983).
The author investigates the use of the phenomenological renormalisation group transformation in the nearest-neighbour square Ising model by means of correlation lengths defined by the moments of the pair correlation function. (9 refs.)

99020 On the group structure, GKS and FKG inequalities for Ising models. B.Baumgartner (Dept. of Math., Univ. of Virginia, Charlottesville, VA, USA).
J. Math. Phys. (USA), vol.24, no.8, p.2197-9 (Aug. 1983).
The FKG inequality is applied to a lattice of states of the Ising model which are related to subgroups of the group of spin variables. The resulting correlation inequalities are exactly the GKS inequalities. (17 refs.)

99021 A generalization of the proof of the triviality of scalar field theories. T.Hattori (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).
J. Math. Phys. (USA), vol.24, no.8, p.2200-3 (Aug. 1983).
The proof of the triviality of ϕ^4 theory in $d>4$ dimensions is generalized. The author shows that the triviality of scalar field theories holds for a wide class of potentials. (9 refs.)

99022 Velocity and diffusion constant of a periodic one-dimensional hopping model. B.Derrida (Div. de la Phys., CENS, Gif-sur-Yvette, France).
J. Stat. Phys. (USA), vol.31, no.3, p.433-50 (June 1983).
The velocity and the diffusion constant are obtained for a periodic one-dimensional hopping model of arbitrary period N. These two quantities are expressed as explicit functions of all the hopping rates. The velocity and the diffusion constant of random systems are calculated by taking the limit $N\rightarrow\infty$. One finds by varying the distribution of hopping rates that the diffusion constant and the velocity are singular at different points. Lastly, several possible applications are proposed. (15 refs.)

99023 Localized excitation transport on substitutionally disordered lattices. G.Korzeniewski, R.Friesner, R.Silbey (Dept. of Chem., MIT, Cambridge, MA, USA).
J. Stat. Phys. (USA), vol.31, no.3, p.451-65 (June 1983).
Average-T-matrix and coherent medium theories are used to study the motion of localized excitations on substitutionally disordered lattices. The authors derive equations which relate coherent medium results for bond and site averaging and show how these reduce to the two-body solution results of Gochanour, Andersen, and Fayer (1979). Numerical results for $P_0(t)$, the probability of remaining at the origin for two-dimensional nearest-neighbor lattices are presented. (17 refs.)

99024 Kinetics of a finite one-dimensional mixture of hard rods with different masses. J.Masoliver, J.Marro (Dept. de Fisica Teorica y de Ecuaciones Funcionales, Univ. de Barcelona, Barcelona, Spain).
J. Stat. Phys. (USA), vol.31, no.3, p.565-75 (June 1983).
A one-dimensional binary mixture of impenetrable (hard core) particles with different mass ratios, $m_2/m_1=1$, 1.05, 1.2, 2, 3, and 4, was simulated to evolve in a computer by the molecular dynamics method. The systems with $m_2>m_1$ and initial velocity distribution $\pm\nu_0$ show a clear tendency to the equipartition of energy and relaxation toward a Maxwellian velocity distribution unlike the nonergodic system with $m_2=m_1$. Several quantities have been monitored during the evolution to investigate its dependence on the mass ratio m_2/m_1. (7 refs.)

99025 Study of Monte Carlo methods for generating self-avoiding walks. C.Brender (Dept. of Chem., Bar-Ilan Univ., Ramat-Gan, Israel), D.Ben-Avraham, S.Havlin.
J. Stat. Phys. (USA), vol.31, no.3, p.661-70 (June 1983).
The concept of fractal dimensionality is used to study different statistical methods for generating self-avoiding walks (SAWs). The reliability of SAWs traced by the enrichment technique and the dynamic Monte Carlo technique is verified. The number of dynamic cycles which represent a single independent SAW of N_0 steps is found to be about $0.1N_0^3$. The authors show that the enrichment process for generating SAWs may be presented as a critical phenomenon. (21 refs.)

99026 On Malcev varieties. V.R.Chandran, V.Varalakshmi (Ramanujan Inst. for Advanced Study of Math., Chepauk, Madras, India).
J. Math. & Phys. Sci. (India), vol.17, no.2, p.201-2 (April 1983). (Proceedings of the Conference on Mathematical Analysis and Applications, Madras, India, 12-13 Nov. 1982).
Proves that the class of Boolean lattices form a Malcev variety. (3 refs.)

99027 Bond percolation threshold in the simple cubic lattice. S.Wilke (Inst. of Theoretical Phys., Cologne Univ., Cologne, Germany).
Phys. Lett. A (Netherlands), vol.96A, no.7, p.344-6 (18 July 1983).
In the simple cubic lattice for bond-percolation the author's Monte Carlo simulation gives a value of $p_{\infty}=0.2492\pm0.0002$, in contradiction to a recent speculation of Sahimi et al. (1983) ($p_{\infty}=0.25273$) and to the possibility $p_{\infty}=1/4$. (12 refs.)

99028 Three-dimensional Ising model with two- and four-particle interaction. M.P.Zhelifonov, R.Z.Uritskaya (Kazan Phys.-Tech. Inst., Acad. of Sci., Kazan, USSR).
Phys. Lett. A (Netherlands), vol.96A, no.9, p.467-70 (1 Aug. 1983).
The three-dimensional Ising model is investigated by the method of interdependent pfaffians. It is shown that this model may be represented as two independent planar lattices. (3 refs.)

99029 Coarse-grained quantities and local environment effects in disordered systems. M.Goda (Faculty of Engng., Niigata Univ., Niigata, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.5, p.1396-402 (May 1983).
It is proved that the effective 'distance' $\bar{m}(\epsilon+i\Gamma)$, proposed first by Matsuda for a linear chain model with nearest-neighbour interaction, exists in any dimensional disordered systems described by a bounded Hamiltonian with short-range interaction. Thus the local situation or short-range order plays an essential role in determining various physical quantities in the sense that the Green function $G_{l,l'}(\epsilon+i\Gamma)$ is almost determined by the local situation of the system at and around the sites l and l'. (22 refs.)

99030 Confirmation of dynamical scaling at the percolation threshold. R.B.Pandey, D.Stauffer (Inst. of Theoretical Phys., Cologne Univ., Koln, Germany).
Phys. Rev. Lett. (USA), vol.51, no.7, p.527-9 (15 Aug. 1983).
In contrast to some earlier studies, good agreement has been found between the asymptotic random-walk exponent for particles restricted to the occupied sites of a simple-cubic lattice, and the dynamical scaling prediction of Gefen et al. (1983). For the first time, up to 10^7 steps were used in the Monte Carlo study, which moreover employed larger lattices (180^3) than earlier studies. (18 refs.)

99031 Anisotropic bond percolation in two dimensions. D.Arovas (Dept. of Phys., Princeton Univ., Princeton, NJ, USA), R.N.Bhatt, B.Shapiro.
Phys. Rev. B (USA), vol.28, no.3, p.1433-7 (1 Aug. 1983).
A new single-parameter renormalization-group equation is formulated for anisotropic bond percolation in two dimensions using a position-space renormalization approach. The new equation yields the exact critical line $P_x+P_y=1$ within both the Migdal-Kadanoff decimation and cell renormalization schemes. For large anisotropy, however, an additional critical line appears leading to a spurious divergence in the correlation-length critical exponent. An alternative scheme, which does not preserve the exact critical surface, but yields a correlation-length exponent relatively independent of anisotropy, is also examined. (13 refs.)

99032 Evidence for classical critical behavior in long-range site percolation. M.Gouker, F.Family (Dept. of Phys., Emory Univ., Atlanta, GA, USA).
Phys. Rev. B (USA), vol.28, no.3, p.1449-52 (1 Aug. 1983).
A new large-cell Monte Carlo renormalization group following the approach of Reynolds et al. (1980) is developed to study site percolation with long-range interaction. The results show that site percolation with a long, but finite, range of interactions has the same correlation-length exponent ν_P approaches its mean-field value of $^1/_2$ indicating that infinite-range percolation exhibits classical critical behavior. (11 refs.)

99033 Essential spectrum of an N-particle additive cluster operator. H.Zoladek (Moscow State Univ., Moscow, USSR).
Theor. & Math. Phys. (USA), vol.53, no.2, p.1085-91 (Nov. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.2, p.216-26 (Nov. 1982).
An N-particle additive cluster operator is considered. An analogue of the Hunziger-van Winter-Zhislin theorem (1960) on the structure of the essential spectrum for fixed total momentum is proved for it. (4 refs.)

99034 Darboux transformations for non-Abelian and nonlocal equations of the Toda chain type. M.A.Sall' (Inst. of Precision Mech. & Optics, Leningrad, USSR).
Theor. & Math. Phys. (USA), vol.53, no.2, p.1092-9 (Nov. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.2, p.227-37 (Nov. 1982).
Darboux transformations are used to construct explicit solutions for the two-dimensionalised Toda chain, sine-Gordon equations and their non-Abelian analogues, the nonlinear Schrodinger equation, the nonlocal Toda equation, and non-Abelian equations of Langmuir oscillations. (19 refs.)

99035 Ising model on finitely presented groups. M.Rasetti (Dipartimento di Fisica, Politecnico di Torino, Torino, Italy).
Group Theoretical Methods in Physics. Proceedings of the XI International Colloquium, Istanbul, Turkey, 23-28 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.513-33K
In statistical mechanics the study of critical phenomena and phase transitions has long been, to a large extent, centered around lattice systems. Space-time lattices were recently introduced as a technical device to obtain cut-off field theories, whose solution would give some insight in field theories defined in continuum Minkowski space-time. Once a lattice field theory has been formulated, the problem can be formally reduced to one of statistical mechanics. The general philosophy is that at the critical point the theory should loose memory of the lattice structure, and the continuous space time results be recovered. Lattice gauge theories are especially remarkable for their relation to the classical spin systems of statistical mechanics. Exactly solvable models are very few in number, and the Ising model still stands at the very frontiers of our present knowledge. So far no exact general solution has been found for it in more than two dimensions. (14 refs.)

99036 Influences of lattice dimension d and character of spin-interactions on the thermodynamics of Ising models. H.Nencka-Ficek (Inst. of Molecular Phys., Polish Acad. of Sci., Poznan, Poland).
Group Theoretical Methods in Physics. Proceedings of the XI International Colloquium, Istanbul, Turkey, 23-28 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.543-5
An exact solution is obtained for hypercubic d-dimensional Ising model with multi-spin interactions. (3 refs.)

99037 Connectivity: a primer in phase transitions and critical phenomena for students of particle physics. H.E.Stanley (Dept. of Phys., Boston Univ., Boston, MA, USA).
Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981, Freiburg, Germany, 31 Aug.-11 Sept. 1981 (New York, USA: Plenum 1983), p.1-42
The author describes briefly three of the principal approaches used to study connectivity phenomena: (a) exact enumeration procedures, (b) Monte Carlo computer simulation, and (c) renormalization group. He concludes with a brief mention of some of the tantalizing relations between connectivity phenomena and various models of thermal critical phenomena such as the Ising model, the Potts model, and a 'polychromatic' generalization of the Potts model. (35 refs.)

99038 Algebraic aspects of exact models. M.Gaudin (Service de Phys. Theorique, CENS, Gif-sur-Yvette, France).
Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981, Freiburg, Germany, 31 Aug.-11 Sept. 1981 (New York, USA: Plenum 1983), p.43-60
Several statistical or dynamical systems modelling a variety of physical phenomena, such as spin chains, two dimensional spin lattices and chemical crystals, or particles in δ function interaction, share the same momentous underlying structures, which are essentially the applicability of Bethe's superposition ansatz for wave functions, the commutativity of transfer matrices, and the existence of an important ternary operator algebra. Their close relationship among each other, and with features like integrability and S matrix factorization discussed in field theoretical context, became familiar in the course of time. The author outlines algebraically the appearance of these structures and interrelations among them, exemplarily for the eight vertex model and for δ function interacting particles of general spin and spin 1/2. (11 refs.)

99039 Polyacetylene: a real material linking condensed matter and field theory. D.K.Campbell (Los Alamos Nat. Lab., Los Alamos, NM, USA).
Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981, Freiburg, Germany, 31 Aug.-11 Sept. 1981 (New York, USA: Plenum 1983), p.217-28
One of the most active subjects of recent research at the interface between field theory and statistical mechanics concerns a real material that seems more properly to belong to the arcana of organic chemistry than to either field theory or statistical mechanics. The material is polyacetylene ($(CH)_x$), a quasi-one dimensional organic polymer with some very interesting and potentially exotic properties. The author gives a pedagogical introduction to some of the recent theoretical studies of polyacetylene and conveys some of the reasons for the intense excitement in this area. (24 refs.)

99040 Finite-size scaling theory. V.Rittenberg (Phys. Inst., Bonn Univ., Bonn, Germany).
Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981, Freiburg, Germany, 31 Aug.-11 Sept. 1981 (New York, USA: Plenum 1983), p.249-58
Fisher's finite-size scaling describes the cross-over from the singular behaviour of thermodynamic quantities at the critical point to the analytic behaviour of a finite system. The author presents the method and then proceeds to show how it is applied to the specific example of a Z_3 symmetric quantum chain. (13 refs.)

99041 Anderson transition and nonlinear σ-models. F.Wegner (Inst. fur Theoretische Phys., Ruprecht-Karls-Univ., Heidelberg, Germany).
Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981, Freiburg, Germany, 31 Aug.-11 Sept. 1981 (New York, USA: Plenum 1983), p.259-60
The author covers the behaviour of a quantum mechanic particle moving in a random potential with special emphasis on the critical behaviour near the mobility edge. Symmetry arguments are reviewed which allow the mapping of such a system onto a field theoretical model of interacting matrices. This model yields an expansion of the critical exponents at the mobility edge around the lower critical dimensionality two. (9 refs.)

05.60 TRANSPORT PROCESSES: THEORY

99042 Boltzmann equation on a lattice global solution for nonMaxwellian gases. A.Palczewski (Inst. of Mech., Univ. of Warsaw, Warsaw, Poland).
Arch. Mech. (Poland), vol.34, no.3, p.287-96 (1982).
The author discusses the nonlinear Boltzmann equation in which the spatial variable is replaced by an infinite lattice. He proves the existence of a global strong solution in the case of nonMaxwellian molecules (unbounded collision kernel). (7 refs.)

99043 Local similarity solutions for the initial-value problem in nonlinear diffusion. R.E.Grundy (Appl. Math. Dept., Univ. of St. Andrews, St. Andrews, Scotland).
IMA J. Appl. Math. (GB), vol.30, no.2, p.209-14 (March 1983).
Considers the initial-value problem for the equation $\partial v/\partial t=(\partial v/\partial x)^2+\beta v(\partial^2 v/\partial x^2)$ with $\beta>0$. For initial data with finite support the interfaces where v is zero may move immediately or after the lapse of a finite time. The structure of the solution, in the cases where this is governed by local conditions on the initial data, is described by local similarity solutions which in the appropriate limit can be matched to the global solution. (4 refs.)

99044 On the stability of a class of kinetic equations. W.Maass (Fachbereich Phys., Philipps-Univ. Marburg, Marburg, Germany).
Found. Phys. (USA), vol.13, no.7, p.715-29 (July 1983).
Stability properties of kinetic model equations (including discrete versions of the master equation and Boltzmann's equation) are derived by means of Lyapunov's direct method. The construction of suitable Lyapunov functions leads to results about the structural stability of the dynamical systems and makes it possible to compose more complicated systems from the given ones, preserving automatically some form of stability. (15 refs.)

99045 Closed similarity solutions for a class of stationary nonlinear Boltzmann-like equations. H.Cornille, A.Gervois, V.Protopopescu (Service de Physique Theorique, CENS, Gif-sur-Yvette, France).
J. Phys. A (GB), vol.16, no.11, p.L343-50 (1 Aug. 1983).
The authors look for closed stationary solutions of nonlinear transport equations of the stochastic Boltzmann type in $(1+1)$ dimensions (velocity v and position x). These solutions, mainly written as the product of an exponential by a polynomial in $z=x^\lambda v^2$, have the quasi similarity property. As a consequence of their polynomial character, they violate the positivity requirement; however, the authors think that they are the dominant term of infinite series solutions which might have the desired positivity property. Calculations are greatly simplified by using sum rules analogous to conservation of mass and energy. (11 refs.)

99046 A note on the super-*H*-theorem for a linear Boltzmann equation. J.O.Vigfusson (Inst. fur Theoretische Phys., Univ. Zurich, Zurich, Switzerland).
J. Phys. A (GB), vol.16, no.11, p.L351-3 (1 Aug. 1983).
The super-*H*-theorem $(-1)^n d^n H(t)/dt^n \geq 0$, $n\geq 1$, $t\in[0,\infty)$, is proven to be incorrect for the Boltzmann equation in the relaxation time approximation (i.e. the homogeneous BGK model for Maxwellian molecules). (12 refs.)

99047 Use of macromolecular compounds to control internal mass transfer in a granular material. A.M.Abramets, I.I.Lishtvan, N.V.Churaev (Peat Inst., Acad. of Sci., Minsk, Belorussian SSR).
J. Eng. Phys. (USA), vol.43, no.6, p.1389-94 (Dec. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.6, p.976-82 (Dec. 1982).
Experimental data are presented on the effects of water-soluble macromolecular compounds (MMC) on the internal mass transfer in quartz sand and peat under nonisothermal conditions. (23 refs.)

99048 Relaxations and high frequency diffusional processes in condensed media. V.O.Shestopal (Div. of Environmental Mech., CSIRO, Canberra, Australia).
Mol. Phys. (GB), vol.49, no.5, p.1231-45 (10 Aug. 1983).
Diffusional mechanisms are considered, particularly of high frequency processes where the frequency of individual jumps is comparable with that of the external force oscillation. The dependence of jump probability on the time interval from the arrival of the diffusing element is taken into account. Introduction of the sink function yields a solution without lengthy calculations. The dispersion equation relating wave vector and frequency and the generalized Fokker-Planck equation are obtained for homogeneous and nonhomogeneous media. The example of interstitial diffusion in a crystal lattice illustrates the method. Diffusion between two states is considered for the case of finite diffusional jump time. The results are applicable to orientational

relaxations. Complex diagrams reveal several maxima on the internal friction frequency dependence, similar to some experimentally observed spectra. The mean velocity and dispersion of a singgle diffusin element are expressed through the probability distribution of diffusional jumps, for both translational and rotational diffusion. (14 refs.)

99049 Systematic method for solving transport equations derived from master equations. O.J.Eder, T.Lackner (Austrian Res. Center, Seibersdorf, Austria).
Phys. Rev. A (USA), vol.28, no.2, p.952-62 (Aug. 1983).
It is shown how a one-dimensional transport equation (derived from a master equation) for a time-dependent conditional average of an arbitrary function can be solved successively, if the moments of the transition probability can be expanded in a series of a special parameter. The transport equation for the time-dependent conditional average value can be transformed into a set of l linear partial differential equations of first order for the lth approximation of the conditional average value. The system of equations is closed in the sense that the lth partial differential equation is determined by the solutions of the l-1 partial differential equations. It is shown how the results obtained compare with the linear noise approximation. Two examples are chosen to illustrate the way to use the method. One is the classical example of the diffusion of a Brownian particle, the other is Alkemade's diode. (17 refs.)

99050 Charged-particle transport in one-dimensional systems [dosimetry application]. G.Muthukrishnan (Health Phys. Unit, Bhabha Atomic Res. Centre, Calcutta, India), D.V.Gopinath.
Radiat. Res. (USA), vol.95, no.1, p.1-14 (July 1983).
A semianalytical technique to study the charged-particle transport in one-dimensional finite media is developed. For this purpose, the transport equation is written in the form of coupled integral equations, separating the spatial and energy-angle transmissions. Legendre polynomial representations for the source, flux, and scattering kernel are used to solve the equations. For evaluation [illegible] the spatial transmission, discrete ordinate representation in space, energy, and direction cosine is used for the particle and source flux. The integral equations are then solved by the fast iteration technique. The computer code CHASFIT, written on the basis of the above formulation, is described. The fast convergence of the iteration process which is characteristic of charged-particle transport is demonstrated. Convergence studies are carried out with a number of mesh points and polynomial approximations. The method is applied to study the depth-dose distributions due to 140-, 200-, 300-, 400-, 600-, and 740-MeV protons incident normally on a 30-cm-thick tissue slab. The values of the quality factor at the surface and at 5 cm depth, as well as the total average quality factor, are calculated. The results thus obtained are compared with those predicted by the Monte Carlo method. This method can also be applied to multienergy, multiregion systems with arbitrary degree of anisotropy. (8 refs.)

99051 Non-holonomy and the diffusion of particles. P.C.Soares (Dept. de Fisica Nuclear, Univ. Federal do Rio de Janeiro, Rio de Janeiro, Brazil), L.C.Gomes.
Rev. Bras. Fis. (Brazil), vol.12, no.2, p.261-83 (June 1982).
The diffusion equation for non-holonomic systems is derived and discussed. This equation, valid in the limit of high viscosity, exhibits in the equilibrium state permanent solenoidal currents. These currents disappear when the system is Liouvillian, a concept introduced to generalize the behaviour of holonomic systems. The continuity of the diffusion equation from non-holonomy to holonomy is also shown. (4 refs.)

99052 Non-holonomy and the diffusion of particles. II. P.C.Soares (Dept. de Fisica Nuclear, Univ. Federal do Rio de Janeiro, Rio de Janeiro, Brazil), L.C.Gomes.
Rev. Bras. Fis. (Brazil), vol.12, no.4, p.663-91 (Dec. 1982).
The authors have obtained the equilibrium solution of the Fokker-Planck equation for both Liouvillian and non-Liouvillian systems. They present procedures to solve the diffusion equation for non-holonomic systems. They present a suggestion as to where such systems may be found in nature, at the microscopic level. (6 refs.)

99053 Decay to uniform states in competitive systems. P.N.Brown (Dept. of Math., Univ. of Houston, Houston, TX, USA).
SIAM J. Math. Anal. (USA), vol.14, no.4, p.659-73 (July 1983).
Weakly coupled parabolic systems describing populations undergoing diffusion and competition in a spatial domain Ω are discussed. Assuming the existence of a unique critical point of the interaction dynamics with all populations coexisting, sufficient conditions are given (on the dynamics) which guarantee the global asymptotic stability of the critical point. These conditions imply the existence of a continuous family of contracting rectangles which decrease down to the critical point and then the theory of contracting rectangles implies the stability. General two and n species models are discussed along with some illustrative examples. (10 refs.)

99054 Diffusions generated from dynamical systems. M.Williams (Dept. of Math., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.290-6
The probability distribution of the random variable defined to be the length of time the process remains within some fixed domain before leaving is determined in the asymptotic limit as the strength of the noise on the system tends to zero. The method used here is an interplay between probabilistic tools and the techniques of differential equations and singular perturbations. (20 refs.)

05.70 THERMODYNAMICS

(see also 44.60 Thermodynamic processes, 64. Equations of state, phase equilibria and phase transitions, 65. Thermal properties of condensed matter; for chemical thermodynamics, see 82.60)

99055 A study of equilibrium points with application to constitutive modelling. K.Frischmuth (Inst. of Fundamental Technol. Res., Polish Acad. of Sci., Warsaw, Poland).
Arch. Mech. (Poland), vol.34, no.3, p.263-73 (1982).
The paper contains an analysis of the behavior of a general constitutive model during relaxation processes. Basic definitions and a minimal set of assumptions are introduced to prove some theorems on equilibrium states as well as on the set of all equilibrium points. The results of Sect. 5 are the starting point for a discussion of unstable processes. Some of the present results are generalizations of theorems, which were earlier obtained by other authors. Several restrictions for the modelling of viscoplastic media follow from the paper. (11 refs.)

99056 A new approach to irreversibility from maximum entropy estimation. M.Dutta, J.Sen Gupta (S.N. Bose Inst. of Phys. Sci., Univ. of Calcutta, Calcutta, India).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.7, p.757-62 (1983).
Deals with the study of some irreversible processes like slow heating of a thermodynamic system or of inhomogeneity, i.e. spatially local equilibrium in it, based on the principle of maximum entropy estimation, in a stochastic model. (8 refs.)

99057 On a third-order phase transition. T.Eisele (Inst. fur Angewandte Math., Univ. Heidelberg, Heidelberg, Germany).
Commun. Math. Phys. (Germany), vol.90, no.1, p.125-59 (1983).
The asymptotic behaviour of random variables of the general form $\ln\Sigma_{i=1}^{\kappa N}\exp(N^{1/p}\beta\zeta_i)$ with independent identically distributed random variables ζ_i is studied. This generalizes the random energy model of Derrida (1980). In the limit $N\rightarrow\infty$, there occurs a particular kind of phase transition, which does not incorporate a bifurcation phenomenon or symmetry breaking. The hypergeometric character of the problems its Φ-function, and its entropy function are discussed. (8 refs.)

99058 Sol-gel transition. A.Coniglio (GNSM, Istituto di Fisica Teorica, Napoli, Italy).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.721-32 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
The basic phenomenology of the sol-gel transition is reviewed. Distinction is made between reversible and irreversible gelation, which can be interpreted correspondingly as an annealed and quenched process. The geometrical nature and the driving mechanism of the sol-gel transition is described and analogies and differences with other types of phase transitions are pointed out. Classical theories, which neglect loops predict a set of critical exponents rather different from those predicted by percolation models. However, more realistic kinetic models seem to fall in a different universality class. When solvent effects are taken into account, the occurrence of critical density fluctuations gives rise to interesting multicritical phenomena, which can be described by a lattice gas Potts model. The structure of the gel network in the vicinity of such a multicritical point is predicted to be rather different from the usual one. (43 refs.)

99059 Residual entropy of two-dimensional ice on a ruby lattice. Keh Ying Lin, Wen Jong Ma (Phys. Dept., Nat. Tsing Hua Univ., Hsinchu, Taiwan).
J. Phys. A (GB), vol.16, no.11, p.2515-19 (1 Aug. 1983).
The authors have calculated the residual entropy of two-dimensional ice on a ruby lattice by the method of series expansion. Based on the first five terms of the series, they have found that the residual entropy is $S=Nk \ln W$ where N is the number of molecules and $W=1.560\pm0.001$. (11 refs.)

99060 Thermal conductivity in the diatomic Toda lattice. F.Mokross, H.Buttner (Phys. Inst., Univ. Bayreuth, Bayreuth, Germany).
J. Phys. C (GB), vol.16, no.23, p.4539-46 (20 Aug. 1983).
The diatomic Toda lattice, a linear chain with exponential interaction and alternating masses, is coupled to different heat baths at the two ends. The non-integrability of the system leads to a quasi-ergodic behaviour. It is shown numerically that a stationary linear temperature gradient is supported by the chain. The conductivity coefficient κ depends on the mass ratio and the temperature of the heat baths, but not on the chain length. The theoretical values for κ compare reasonably well with experimental results in BN and MgO. (21 refs.)

99061 On the relationship between fluctuating irreversible thermodynamics and 'extended' irreversible thermodynamics. J.Keizer (Dept. of Chem., Univ. of California, Davis, CA, USA).
J. Stat. Phys. (USA), vol.31, no.3, p.485-97 (June 1983).
The relationship between fluctuating irreversible thermodynamics and theories of irreversible processes which include the thermodynamic fluxes as independent variables is explored. It is shown that the usual fluctuating linear theory of irreversible thermodynamics is a contraction of the extended theory. This contraction contains nonMarkovian effects dependent upon the relaxation times associated with the thermodynamic fluxes. In the limit that these relaxation times are small, the extended theory is shown to be equivalent to the usual fluctuating thermodynamic theory. A critique of the extended theories is given from the point of view of the mechanistic statistical theory of irreversible processes. (36 refs.)

99062 Extrapolation and series acceleration procedures: hard spheres and discs as illustrations. M.V.Sangaranarayanan, S.K.Rangarajan (Dept. of Inorganic & Phys. Chem., Indian Inst. of Sci., Bangalore, India).
Phys. Lett. A (Netherlands), vol.96A, no.7, p.339-43 (18 July 1983).
Three new procedures—in the context of estimation of virial coefficients and summation of the partial virial series for hard discs and hard spheres—are proposed. They are based on the parameterised Euler transformation, a novel resummation, identity and the ϵ-convergence methods respectively. A comparison with other estimates (molecular dynamics, graph theory and empirical methods) reveals satisfactory agreement. (15 refs.)

99063 Exact results for a linear chain planar EQQ model. R.B.Pandey (Dept. of Phys., North Carolina State Univ., Raleigh, NC, USA).
Phys. Lett. A (Netherlands), vol.96A, no.8, p.397-8 (25 July 1983).
A linear chain planar EQQ model is studied using the transfer matrix method. The specific heat is found to vary as T^2 in the high-temperature limit and is linear in T in the low-temperature to the leading orders. (7 refs.)

99064 Comment on 'The question of an upper bound on entropy'. B.R.Iyer, J.Samuel (Raman Res. Inst., Bangalore, India).
Phys. Lett. A (Netherlands), vol.97A, no.3, p.99 (15 Aug. 1983).
Shows that the upper bound on the entropy of a finite system proposed by Qadir (see ibid., vol.95A, p.285, 1983) is not universal and consequently

neither interesting nor relevant to the Bekenstein-Unruh-Wald debate (1981-3). (3 refs.)

99065 Phase transitions in new solvable Hamiltonians by a Hamiltonian minimization. M.Kardar (Dept. of Phys., MIT, Cambridge, MA, USA).
Phys. Rev. Lett. (USA), vol.51, no.7, p.523-6 (15 Aug. 1983).
By minimization of a Hamiltonian with respect to its interaction parameters, new Hamiltonians are generated. The same minimization procedure is carried out with the free energy of the initial Hamiltonian, and it is proven that in the thermodynamic limit the minimized free energy is the free energy of the minimized Hamiltonian. This method is illustrated with two-dimensional Ising models generalized to include both nearest-neighbor bonds and infinite-range bond-bond interactions. New critical behaviour is observed. (19 refs.)

99066 Bounds on the effective thermal conductivity of two-phase systems. R.N.Pande, V.Kumar, D.R.Chaudhary (Dept. of Phys., Univ. of Rajasthan, Jaipur, India).
Pramana (India), vol.20, no.4, p.339-46 (April 1983).
The weighted geometric mean of resistors considered for determining the effective thermal conductivity K_E of two-phase systems has been optimised. Solutions of the equations lead to a useful set of bounds. When compared with other bounds the present bounds give the better results in estimating the upper and lower values of the effective thermal conductivity of a two-phase system. (20 refs.)

99067 On the virial coefficients of the equation of state of system of non-axial molecules. S.Singh (Dept. of Phys., Banaras Hindu Univ., Varanasi, India).
Pramana (India), vol.20, no.4, p.347-57 (April 1983).
A thermodynamic perturbation theory in which all angle-dependent interactions are considered as a perturbation of the central potential is applied to calculate the second and third virial coefficients of a fluid composed of non-axial molecules. The influence of a large number of anisotropic pair- and three-body non-additive interactions has been considered. Experimental values have been used for the dipole moment, quadrupole tensor and for anisotropic polarizability. The parameters for the central Lennard-Jones (12-6) potential have been determined from the viscosity data. The relative contribution of each branch of pair and triplet interactions has been evaluated as a function of temperature for molecules possessing both the axial- and non-axial symmetries. It has been shown that the non-axial approximation is an improvement over the axial one. Theoretical results have been compared with the experimental data of CH_3OH. (19 refs.)

99068 Topological entropy on rotation sequences. C.Gillot (Dept. de Math., Inst. Nat. des Sci. Appl., Toulouse, France).
Dynamical Systems and Chaos. Proceedings of the Sitges Conference on Statistical Mechanics, Sitges, Barcelona, Spain, 5-11 Sept. 1982 (Berlin, Germany: Springer-Verlag 1983), p.254-6
Let $f:[0,1]\rightarrow[0,1]$ be a continuous unimodal map: for $u\epsilon[0,1]$,f is strictly increasing on $[0,u]$,$f(0)>0$,$f(u)=1$, and strictly decreasing on $[u,1]$, $f(1)=0$ The author assumes that f is such that u is a periodic point, with period $N>2$. The relative positions of the iterates of u are transcribed by some distinct integer sequence $R_N=(i_k)$. $1\leq k,i_k\leq N$, which is called the rotation sequence of the cycle. The aim of this paper is to give a direct application of these properties in the study of topological entropy. He claims that entropy can be defined on the set of rotation sequences, and, among others, a 'fractal' behaviour of the entropy function is shown. (6 refs.)

99069 Dynamic groups and coexistence phenomena. A.I.Solomon (Faculty of Maths., Open Univ., Milton Keynes, England).
Group Theoretical Methods in Physics. Proceedings of the XI International Colloquium, Istanbul, Turkey, 23-28 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.553-7
This note describes an application of dynamical Lie groups to many body systems exhibiting phase transitions. The specific model exemplified is that of a three-phase many fermion system for which the appropriate groups is SO(6). (12 refs.)

05.90 OTHER TOPICS IN STATISTICAL PHYSICS AND THERMODYNAMICS

99070 A simplification of the Second Law of Thermodynamics. J.F.McCauley.
Energy Eng. (USA), vol.80, no.3, p.51-65 (1983).
The article presents some facsimiles between thermal, electrical and hydraulic energy as they relate to the Second Law of Thermodynamics. It cites specific examples of Second Law applications and presents a numerical quality yardstick for consideration in preliminary energy source-energy receiver matching. (no refs.)

06.20H Measurement standards and calibration

99072 Calibration of wavelengths by optogalvanic spectroscopy. Jin Ju-guang, Jin Chang-tai, Wang Song-yue (Changchun Inst. of Appl. Chem., Acad. Sinica, China).
Chin. Phys. (USA), vol.3, no.2, p.430-2 (April-June 1983).
Typical optogalvanic spectra of neon, lithium, sodium, calcium, and nickel were obtained using hollow cathode lamps and a tunable CW dye laser in the 574-625 nm range. 43 spectral lines of neon were identified and the first optogalvanic spectroscopical data were provided for calibrating wavelengths. Optimum conditions for generating optogalvanic spectra and the characteristics of optogalvanic spectroscopy were discussed. (no refs.)

99073 Radiation standard of high radiance. E.Geyer, K.Gunther, St.Lang.
Exp. Tech. Phys. (Germany), vol.31, no.3, p.257-64 (1983).
The operation conditions and the radiation properties of a pulsed radiation standard are described which emits a blackbody radiation of 12000K for wavelengths >310 nm during a 1 ms pulse. A recent comparison of the source with state temperature standards (IPTS-68) as well as the particularities of the use of the radiation standard in connection with time integrating radiation detectors are described. (7 refs.)

99074 Gold as a reliable internal pressure calibrant at high temperatures. L.C.Ming, M.H.Manghnani, J.Balogh (Hawaii Inst. of Geophys., Univ. of Hawaii, Honolulu, HI, USA), S.B.Qadri, E.F.Skelton, J.C.Jamieson.
J. Appl. Phys. (USA), vol.54, no.8, p.4390-7 (Aug. 1983).
Energy-dispersive X-ray diffraction measurements on a mixture of powdered NaCl and Au were carried out at high temperatures up to 600°C (at atmospheric pressure) and also at simultaneously high temperatures and high pressures (to 425°C and 10.2 GPa). A modified diamond-anvil high pressure cell with a mini resistance-wire heater was used in conjunction with the synchrotron radiation at the Stanford Synchrotron Radiation Laboratory. The temperature of the sample was measured directly by a precalibrated Pt-Pt 10% Rh thermocouple adjacent to the sample. The pressure of the sample was determined by measuring the molar volume changes in NaCl and deriving the pressure through an equation of state. The measured thermal expansion from 25°C up to 600°C for NaCl and Au at 1 atm can be expressed by second-order polynomials: $V/V_0(\mathrm{NaCl})=1+(1.08\pm0.05)\times10^{-4}(T-25)+(7.5\pm1.1)\times10^{-8}(T-25)^2$ and $V/V_0(\mathrm{Au})=1+(4.26\pm0.85)\times10^{-5}(T-25)+(5.0\pm20)\times10^{-9}(T-25)^2$, where T is in °C. These results are in excellent agreement with previously published data. The measured molar volume ratios of Au at simultaneously high temperatures and high pressures have been found to be in good agreement (within 0.2%) with the values based on the calculated isochore from shock wave data. The pressures determined from the compression of Au at high temperature are compatible with those based on the compression of NaCl (within 2.7% at pressures up to 10.2 GPa). These results enhance the reliability and the scope of the use of Au as an internal pressure calibrant at high temperatures. (16 refs.)

99075 Measuring and test equipment calibration systems. D.M.Turnbull (Consumers Power Co., Midland, MI, USA).
Qual. Prog. (USA), vol.16, no.5, p.28-33 (May 1983).
Discusses the calibration of measuring and test equipment. The calibration system should be described in a written procedure. A company that has a defence contract will usually have MIL-STD-45662 imposed on it. A calibration procedure must also address a range of environmental controls, including the conditions under which production and inspection instruments may be used, the conditions under which calibration must be done, and alternatives to use when required conditions cannot be obtained. 99076 Particle size distributions from forward scattered light using the Chahine inversion scheme. R.Santer, M.Herman (Lab. d'Optique Atmospherique, Univ. des Sci. et Tech. de Lille, Villeneuve d'Ascq, France).
Appl. Opt. (USA), vol.22, no.15, p.2294-301 (1 Aug. 1983).
The classical inversion of forward scattered light to obtain the size distribution of spherical particles is considered. Using the diffraction approximation, the measurement points are selected so as to reduce the influence of the particle refractive index and to make the Chahine inversion scheme usable with a good convergence rate. The algorithm efficiency, in the presence of refractive-index errors and of experimental noise, is studied. An interesting behavior of the Chahine inversion scheme, in the presence of very large experimental errors, is outlined. (11 refs.)

99077 Simultaneous determination of refractive index and size of spherical dielectric particles from light scattering data. P.Chylek, V.Ramaswamy (Nat. Center for Atmospheric Res., Boulder, CO, USA), A.Ashkin, J.M.Dziedzic.
Appl. Opt. (USA), vol.22, no.15, p.2302-7 (1 Aug. 1983).
The diameter and refractive index of micrometer sized spherical dielectric particles are simultaneously deduced using the wavelength dependence of backscattering data from optically levitated particles. The accuracy of the results is set by experimental errors in the determination of the wavelength of backscatter resonance peaks and the ratio of slopes of specified peaks. At present the refractive index and diameter can be deduced with relative errors of 5×10^{-5}. This represents the most accurate determination of absolute size and refractive index yet made by light scattering. A reduction of these errors by an order of magnitude is possible. The authors assume a priori knowledge of diameter and refractive index with accuracy of 10^{-1} and 5×10^{-3}, respectively. (10 refs.)

99078 Particle size distributions from Fraunhofer diffraction. I. An analytic eigenfunction approach. M.Bertero (Istituto di Sci. Fisiche, Univ. di Genoa, Genoa, Italy), E.R.Pike.
Opt. Acta (GB), vol.30, no.8, p.1043-9 (Aug. 1983).
Generalized concepts of information theory indicate that the numerical solution of the Fredholm equation of the first kind relating a particle-size distribution to its Fraunhofer diffraction pattern can be achieved without ill-conditioning by use of a truncated eigenfunction expansion. The authors give explicit analytic formulae for the eigenfunctions and eigenvalues of this problem and give numerical values of the latter of use for experimental reductions. The results show how many independent fractions of a particle-size distribution may be determined in the presence of quantified levels of noise. (7 refs.)

99079 Low amplitude measurement by direct lock-in ESPI, a proposal. P.B.Nagy (Appl. Biophys. Lab., Tech. Univ. Budapest, Budapest, Hungary), O.J.Lokberg.
Opt. Commun. (Netherlands), vol.47, no.1, p.18-22 (1 Aug. 1983).
A method for mapping of low vibrational amplitude and phase distributions is proposed. The method is based on the use of an image orthicon TV-camera as a two-dimensional lock-in amplifier. The potentials of the technique are discussed, and compared to similar techniques. (13 refs.)

99080 Measurements of the size and position of aerosol droplets using holography. W.Grabowski (Inst. of Meteorology & Water Management, Warsaw, Poland).
Opt. & Laser Technol. (GB), vol.15, no.4, p.199-205 (Aug. 1983).
Positions and diameters of aerosol particles are measured using Gabor's holographic system. The infuence on image quality of the homogeneity of the holographic material, resolution, hologram processing method and optical reconstruction system are considered. The best experimental procedure is suggested. (17 refs.)

99081 A contactless method of measuring rapidly varying displacements. R.Boruta, L.Majewski.
Pomiary Autom. Kontrola (Poland), vol.29, no.1, p.10-11 (Jan. 1983). In Polish.
Discusses a method of measuring linear displacements by means of a specially constructed measuring system. This system has been used for measuring the components of displacement of the centre of a connecting-rod bushing relative to the centre of a slider crank mechanism. The measurement results are shown in the form of diagrams. (2 refs.)

99082 Teaching and research in the electronic measurement of distances in the TU Dresden. F.Deumlich (Tech. Univ. Dresden, Dresden, Germany).
Wiss. Z. Tech. Univ. Dresden (Germany), vol.31, no.5, p.199-204 (1982). In German. [received: May 1983]
The author discusses the physical basis of electronic measurement of distances (tachymetry) and the development of its application in the past 30 years, describing a number of electro-optical and microwave distance measuring devices made in the GDR. It deals with the training of students of geodesy in the use of electronic tachymetry and its relation to the general development of the discipline. It concludes with an account of some recent research and development work in connection with electronic tachymetry, with particular reference to activities in the TU Dresden. (30 refs.) *C.J.O.G.*

99083 The extremum-slope criterion for precise dimensional measurements in neutron radiography. J.C.Osuwa, A.A.Harms (McMaster Univ., Hamilton, Ontario, Canada).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.859-65
An analytical-experimental procedure for the ready determination of dimensional measurements of radiographed objects is described. The application of this procedure requires only elementary curve fitting of the experimentally obtained optical density variation about the edge of the radiograph and the determination of the point at which the optical density slope is a maximum. Theory suggests that this method is essentially exact; experimental tests provide excellent confirmation. (8 refs.)

(for astronomical aspects see 95.70)

99084 Optical transmission channel for a standard frequency signal, by means of a laser [carrier beam].. A.Podoleanu, P.E.Sterian (Inst. Politehnic Bucuresti, Bucuresti, Rumania).
Metrol. Apl. (Rumania), vol.30, no.1, p.25-9 (1983). In Rumanian.
The system described can provide a standard frequency to various users for calibration purposes. A He-Ne laser is 5% modulated (by HT variation) with a highly accurate 100 kHz signal and the beam is transmitted through the atmosphere. The signal is received via a photodiode, actively filtered and then converted to 1 or 10 MHz standard frequency by means of a phase-locked loop circuit controlling a suitable oscillator with its appropriate frequency divider circuits. Block diagrams and circuit details are given. A 30 day plot of relative atmospheric attenuation has shown losses of 0 to 40 dB; the phase-locked loop, however, remained stable under such conditions. 06.70 GENERAL INSTRUMENTATION

99090 Measurement of bending loads with suspended electric strain guages. A.P.Loktionov.
Sov. Aeronaut. (USA), vol.25, no.2, p.85-8 (1982). Translation of: *Izv. VUZ Aviats. Tekh. (USSR)*, vol.25, no.2, p.73-5 (1982).
Suspended electric strain guage displacement transducers are widely used in devices for measuring the load on structural elements. Transducers measuring the bending and shearing deformations of the landing gear structural elements have been introduced in the last decade in the on-board equipment for measuring aircraft ramp weight and cg location. This equipment is effective as a supplement to platform scales. The OBAWS system determines the weight of the Douglas DC-10 and Boeing 747 airplanes with an error of ±1%. (6 refs.)

99091 A power compensation measurement transducer for micropressure differences. P.Krischker (Tech Univ. Berlin, Berlin, Germany).
Tech. Mess. tm (Germany), vol.50, no.7-8, p.273-6 (July-Aug. 1983). In German.
A transmitter for measuring very small pressure differences in liquids and gases is presented. It works on the principle of power inverse feedback and is constructed as a double membrane system. The tap and the positioning device are placed between the membranes. The usable resolution capacity of the transducer is 0.1 μbar (8×10^{-5} Torr) and the linear deviation and hysteresis values are below $\pm 1^{0}/_{00}$ of the final value. Apart from a short responding time this measurement principle offers the possibility of cutting out the breathing or swallowing volume of the membranes. (5 refs.)

99092 The gyroscope as a precision force transducer.
Transducer Technol. (GB), vol.5, no.1, p.24 (Oct. 1982).
The property of precession of a gyroscope can be exploited to provide a no-movement force transducer with good resolution and extremely fast response. The principle of gyroscope operation is outlined and its applications to weighing are considered. (no refs.)

99093 Semiconductor strain gauges. M.Baker.
Transducer Technol. (GB), vol.5, no.1, p.25, 27, 30 (Oct. 1982).
Discusses the development and applications of semiconductor strain gauges. In particular, the principle, fabrication and properties of Si piezoresistive gauges are dealt with. (no refs.)

99094 Trends in digital oscilloscope applications. A.Tegen (Nicolet Instrument Corp., Madison, WI, USA).
Wescon/81 Conference Record, San Francisco, CA, USA, 15-17 Sept. 1981 (El Segundo, CA, USA: Electron. Conventions 1981), p.7/1/1-4
Improvements in digital circuitry have widened the applications for which oscilloscopes are the optimum measuring instruments. The author discusses the trends of such applications and considers digital storage to be at the heart of these changes, for it brings with it the ability to hold and quantify time-varying signals for close inspection. Microprocessors within the digital oscilloscope control much of its functioning and memory usage. They can also take display refinements even further, by adding cursors which are controllable by the user. These cursors are easily moved to points of interest, with exact time and voltage displayed on the screen. 'Time per division' and 'volts per centimeter' calculations are unnecessary. (no refs.)

99095 Techniques for the measurement of forces between solids. K.B.Lodge (School of Molecular Sci., Univ. of Sussex, Brighton, England).
Adv. Colloid & Interface Sci. (Netherlands), vol.19, no.1-2, p.27-73 (July 1983).
Techniques for the direct measurement of forces between solids as a function of the distance of separation of their surfaces are reviewed. If the solids are separated by gas or a vacuum, then the forces are generally identified as macroscopic van der Waals forces. The impetus for their measurement has been the verification of the Lifshitz theory. The non-linear character of these forces means that the measuring system has very interesting mechanical properties. The exploitation of these properties in measurements by deflection, dynamic and jump methods is discussed. Particular attention is given to a completely novel technique; the dynamic-jump method. The existence of repulsive forces between solid particles dispersed in liquid phases has been known for a long time in colloid science. In ionic solutions, the measurement of forces between solids has reproduced the effects predicted by simple electrical double-layer theory. In polymer solutions forces have been detected that may be attributed to steric stabilisation forces. However, the nature of forces due to liquid structure has not been so well known. Recently, liquid structure forces of an oscillatory character have been measured between mica sheets. Forces measured between hydrophobic surfaces in aqueous systems under certain conditions exhibit significant departures from DLVO theory. (183 refs.)

99096 Influence of hysteresis upon the coefficient of dynamometer sensitivity. N.Fintinaru (Inst. Nat. de Metrologie, Timisoara, Rumania).
Metrol. Apl. (Rumania), vol.30, no.1, p.9-12 (1983). In Rumanian.
The metrological behaviour of mechanical and electrical dynamometers and their calibration has been the subject of extensive research in recent years. Compensating curves were presented previously for the characteristics of nine different instruments. The author follows this up by studying the influence of hysteresis upon the scale coefficient for the same instruments. These are oval type PGH Kraftmessgerate Halle/Saale RDG, fitted with 1/100 mm quadrant comparators (five compression- and four extension-type instruments). Results are tabulated. (8 refs.) *C.J.R.*

07.20 THERMAL INSTRUMENTS AND TECHNIQUES

(see also 44.50 Thermal properties of matter, 44.60 Thermodynamic processes; for radiometry and detection of thermal radiation see 07.60D and 07.62)

99098 Dynamic properties of instruments for measuring heat flux. S.Lopata, J.Taler (Inst. Aparatury Przemyslowej i Energetyki, Politech. Krakowskiej, Krakow, Poland).
Pomiary Autom. Kontrola (Poland), vol.29, no.1, p.1-3 (Jan. 1983). In Polish.
The authors derive and experimentally check the formulae for determining dynamic properties of instruments for measuring heat flux. A comparison is made of dynamic properties of the two commonest measuring methods. (9 refs.)

99099 Flow induced vibration in a heat exchanger with seal strips. J.H.Kissel (American Standard, Heat Transfer Div., Buffalo, NY, USA).
Trans. ASME. J. Heat Transfer (USA), vol.104, no.2, p.372-8 (May 1982).
Flow induced vibration tests using water as the shell side medium were conducted on a shell and tube exchanger with single segmental baffles and various tube layouts. The heat exchanger was of the externally packed floating head type with seal strips that directed the water flow into the bundle to prevent by-passing of the fluid between the bundle and the shell. High localized velocities exist in the vicinity of the seal strips and contributed directly to the vibration problem. The tube natural frequency for various baffle spacings was measured at the vibration point and a gap velocity at the critical section of the bundle was estimated. A correlation was then made with these parameters and the fluidelastic excitation theory. A discussion of the velocity profile through the heat exchange is included. (5 refs.)

99100 Effectiveness criteria for recuperative thermocouples. Yu.M.Lobunets'.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.6, p.64-7 (1983). In Ukrainian.
The efficiency of recuperative thermocouples is determined by the Ioffe number $I_0=(e^2\sigma/\lambda)\Delta t_0$ and by the $\Lambda=\lambda s/hW$ and $\beta=KF/W$ factors. (2 refs.)

99101 Problem of compensating the influence of temperature changes on measurement results.. Z.Moron (Inst. Metrologii Elektrycznej, Politech. Wroclawskiej, Wroclaw, Poland).
Pomiary Autom. Kontrola (Poland), vol.29, no.1, p.12-14 (Jan. 1983). In Polish.
Discusses an example of measurements of physico-chemical properties of a substance. A method is presented of temperature compensation using a polynomial approximation of temperature characteristics of objects, and also an electronic circuit to accomplish such a compensation. A case is also considered of a compensation where the approximating polynomial has variable coefficients. (6 refs.)

99102 Temperature determination of freely rotating bodies. A.Weller (Inst. fur Grenzflachenforschung & Vakuumphys., KFA Julich, Julich, Germany).
Rev. Sci. Instrum. (USA), vol.54, no.8, p.952-7 (Aug. 1983).
A new approach for the determination of the temperature of rotating bodies is described, which makes use of the fact that the sample is rotating with virtually no friction. The basic principle is that a temperature change causes thermal expansion, and hence a change in the moment of inertia which, due to conservation of angular momentum, results in a change of rotational frequency. The method was used to determine the temperature of a magnetically suspended cylinder of pure iron within ±5K while cooling down from 800 to 300K. The contact-free suspension is ideally suited to study the radiative interaction of the sample with its environment. It is shown that on the basis of the Stefan-Boltzmann equation the time constant of radiation exchange and the emissive power of the sample can be evaluated. From the results of these investigations the measuring limit of a spinning rotor vacuum gauge due to temperature fluctuations can be estimated. (7 refs.)

99103 Radiation error correction method for temperature measurement by the digital type thermometer. M.Kawamura, H.Uesako (Faculty of Engng., Tokyo Univ., Kawagoe, Japan).
Trans. Soc. Instrum. & Control Eng. (Japan), vol.19, no.4, p.308-13 (April 1983). In Japanese.
An experimental result is reported on the radiation error correction method for temperature measurement by the thermistor type digital thermometer. A principle for the radiation error correction is based on the fact that radiation error varies on each emissivity of a temperature sensing element. That is using two points of measured temperature values obtained by separate temperature sensing elements having different emissivity and temperature value on the coordinate axis at emissivity equals to zero is extrapolated. During the experiment, two kinds of digital type thermometers have been employed, one of which is a reflection type equipped with gold or aluminum vaporised temperature sensing element of lower emissivity and another black painted absorption type with the emissivity nearly equals to unity. Accurate temperature can be calculated by an extrapolation formula using the measured emissivities by the two thermometers and an emissivity ratio between two thermometers. (5 refs.)

07.20M Cryogenics

99104 An automatic low temperature heat switch. W.Hilberath, B.Vowinkel (Univ. Koln, Koln, Germany).
Cryogenics (GB), vol.23, no.9, p.467-8 (Sept. 1983).
A heat switch for use at cryogenic temperatures is described. It utilizes the pressure-dependence of thermal conductivity of gases and the decrease of vapour pressure with temperature. The switching temperature can be varied widely by changing the working gas. Due to the absence of mechanically moving parts, lifetime and reliability are high. A thermal conductivity on/off ratio of 500 can easily be achieved. (6 refs.)

99105 The Joule-Thomson microliquefier described with use of dimensional analysis. E.Bodio, M.Chorowski (Tech. Univ. of Wroclaw, Wroclaw, Poland).
Cryogenics (GB), vol.23, no.9, p.469-70 (Sept. 1983).
Single stage Joule-Thomson microliquefiers have been studied in an open system. A set of easily measure parameters which influence the liquefaction process has been determined. The relation between these parameters has been found using dimensional analysis theory and experimental data. (7 refs.)

99106 Ultimate temperature stability of a magnetic refrigerator. P.Kittel (NASA, Ames Res. Center, Moffet Field, CA, USA).
Cryogenics (GB), vol.23, no.9, p.477-8 (Sept. 1983).
The ultimate stability limit of an isothermal demagnetization feedback control system is discussed. (4 refs.)

99107 A simple inexpensive cryostat for measurement of Mossbauer spectra from 77K to 300K. S.Das, M.Bhattacharya, R.Bhattacharya (Saha Inst. of Nuclear Phys., Calcutta, India).
Cryogenics (GB), vol.23, no.9, p.479-81 (Sept. 1983).
A simple continuous flow cryostat designed for Mossbauer investigations with liquid nitrogen in the temperature range 77-300K is described. The cryostat is built with a perspex sample holder, glass tubes and metallic frames for mylar windows which facilitate transmission of gamma rays. A copper-constantan thermocouple is used as the temperature sensor. The cryostat can be used in investigations where either the absorber or the source is at rest and the detector-absorber-source axis is horizontal. The performance of the unit is tested on low-temperature studies of stainless steel. (3 refs.)

99108 A cryostat for investigating inelastic scattering of neutrons on liquid He^4 between 4.2 and 0.5K. I.V.Bogoyavlenskii, Yu.Ya.Milenko, L.V.Karnatsevich, V.S.Kogan, A.V.Puchkov, V.A.Parfenov, J.A.Kozlov, N.M.Blagoveschenskii (Inst. of Phys. & Technol., Acad. of Sci., Kharkov, Ukranian SSR).
Cryogenics (GB), vol.23, no.9, p.498-500 (Sept. 1983).
A cryostat is described which is designed for the research of inelastic scattering of neutrons on a large volume (3.5 l) of He^4 between 4.2 and 0.5K. Temperatures lower than 1.3K are produced by means of pumping out vapour above liquid He^3 ($\sim$330 cm^3) with an adsorption pump (1 kg of coal CKT-2) located in the device itself. A minimum temperature is held during 140 h. The essential time for the cryostat start is about 10 h. The cryostat was used for the measurement of temperature dependence of the Bose-condensate density in He^4. (5 refs.)

99109 Optimization and temperature distribution of a current lead for a cryogenic device. Nan. H.L..
Cryogenics (GB), vol.23, no.9, p.501-7 (Sept. 1983).
A method of optimizing the cross-sectional area of a cooled current lead is described in this paper. First, the dependence of the gas flow rate on the cross-sectional area is derived from the heat balance equations. Then, two curves are acquired, one relating to the optimum area, and the other to the corresponding temperature gradient at the cold end. The product of the utilization coefficient of the coldness together with the temperature difference is the independent variable of the functions represented by the two curves, from which the graphic changes of the minimum gas flow rate under various situations would be noted. Also mentioned here is the choice of the optimum material. On the basis of the result of the calculation given above, curves of one-dimensional temperature distribution of a lead under different conditions could be drawn up. Lastly, the designing principle of a lead with non-constant cross-section area is discussed. (7 refs.)

99110 Cryogenic system for production testing and measurement of Fermilab Energy Saver superconducting magnets. W.E.Cooper, A.J.Bianchi, R.K.Barger, F.B.Johnson, K.J.McGuire, K.D.Pinyan, F.R.Wilson (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3602-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The cryogenic system of the Fermilab magnet test facility has been used to provide cooling for the testing of approximately 1200 Energy Saver superconducting magnets. The system provides liquid helium, liquid nitrogen, gas purification, and vacuum support for six magnet test stands. It provides for simultaneous high current testing of two superconducting magnets and non-high current cold testing of two additional magnets. The cryogenic system has been in operation for about 32000 hours. The 1200 magnets have taken slightly more than three years to test. (4 refs.)

99111 Cryostat for combined investigation of kinetic and photoelectrical properties of semiconductors within the range from 2 to 650K. S.A.Aliev, D.G.Arasly, Z.F.Agayev, Sh.S.Ismailov, E.I.Zul'figarov.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.6, p.67-71 (1982). In Russian.
Deals with the description of cryostat for the combined investigation of kinetic and photoelectrical properties of semiconductors within the range from 2 to 650K. The mounting of the sample the cryostat allows one to measure the coefficients of the electroconductivity σ, thermoelectromotive force α, heat conductivity χ, Hall coefficient R, magnetoresistance $\Delta\rho/\rho$, magnetothermoelectromotive force $\Delta\alpha$, Nernst-Ettingshausen $Q_\perp$ and Righi-Leduc S transverse thermomagnetic effects, Magy-Righi-Leduc effect $\Delta\chi$, Nernst-Ettingshausen galvanomagnetic effect. Remounting of the sample gives the possibility of measuring additionally the linear magnetoresistance, Etting-

shausen linear galvanomagnetic effect, and photoelectrical and photomagnetic effects. Moreover, it can be used to study different characteristics of solid state refrigerating devices. They are as follows: Peltier device, magneto-Peltier device and Peltier-magneto-Peltier-Ettinghausen hybrid refrigerating device. (11 refs.)

99112 Simple differential thermometer for low temperatures using a thermocouple with a SQUID detector. Y.Maeno, H.Haucke, J.Wheatley (Los Alamos Nat. Lab., Los Alamos, NM, USA).
Rev. Sci. Instrum. (USA), vol.54, no.8, p.946-8 (Aug. 1983).
Details of design and construction of a simple and rugged thermocouple differential thermometer are presented. Gold +0.03 at.% iron wire is used, with niobium leads connected to a SQUID. It is demonstrated that at 1K the response time is about 15 ms and that the temperature sensitivity of 10^{-7}K with a 10-Hz filter is Johnson-noise limited. Additional qualities such as small size, little self-heating, and high reproducibility make this device ideal for differential thermometry at low temperatures. (10 refs.)

99113 Behavior of diffused planar germanium thermometers at temperatures below 1K. G.X.Mack, A.C.Anderson (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA), P.R.Swinehart.
Rev. Sci. Instrum. (USA), vol.54, no.8, p.949-51 (Aug. 1983).
The performance of diffused planar germanium thermometers is found to be reliable at temperatures $T>90$ mK. At lower temperatures performance can be limited by overheating caused by measuring and spurious currents. The heating is associated with a thermal impedance $Z \propto T^{-4}$ which is larger than that found in typical bulk germanium thermometers. Surprisingly, Z is found to be essentially independent of the size of the planar resistor. (13 refs.)

07.25 HYGROMETRY

99114 Hygrometers—meeting the needs of an expanding market. D.T.Parker (Shaw Moisture Meters, Bradford, England).
Hong Kong Eng., vol.11, no.4, p.55-7 (April 1983).
Manufacturing and chemical processes as well as operating procedures for new equipment, which require an accurate measurement of moisture levels in air, gases and liquids, continue to multiply. The article describes how an established manufacturer of moisture meters is keeping pace with the needs of an increasingly-demanding market. (no refs.)

99115 Humidity sensing with heat-treated composite films of silicone polymers and metal oxides. F.Uchikawa, K.Miyao, K.Shimamoto (Material Engng. Lab., Mitsubishi Electric Co. Ltd., Kamakura, Japan).
Oyo Buturi (Japan), vol.52, no.5, p.451-8 (May 1983). In Japanese.
Basic materials of the humidity sensitive films of the present humidity sensor are heat-treated mixtures of silicone polymers and metal oxides. Upon heating, the organic groups in silicone polymers are decomposed. New composite materials are thus formed, which are based on metal oxides bound by the decomposition residue. One of the main constituents is amorphous SiO_2. The present sensor has good humidity sensitivity characteristics which vary with heat-treated temperatures. Hardly any surface hydroxyl group is formed on the humidity sensitive element of the present sensor (heat-treated at 500°C). Therefore, the present sensor is more reliable than the conventional ceramic humidity sensors with regard to the time dependence of humidity-resistance characteristics. Also, the present sensor can be produced by heat treatment at lower temperatures in comparison with the conventional ceramic sensors. (29 refs.)

07.30 VACUUM PRODUCTION AND TECHNIQUES

(inc. pressures below 1 atmosphere; see also 47.45 Rarefied gas dynamics; 81.15G Vacuum deposition)

99116 Performance of the SPS ring vacuum system for colliding beam operation. B.Angerth, R.B.Flockhart, G.Kouba, H.Wahl (European Organization for Nuclear Res., CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2790-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The SPS ring vacuum system was recently upgraded to the vacuum requirements for proton-antiproton collider operation. The new specification stipulated an average operating pressure in the ring of 3.10^{-9} mbar, to be reached within 10 days of pumping after a venting to air. The pressure is expressed in nitrogen equivalent gauge reading. Bakeout to rapidly reduce the gas desorption from the system cannot be used in the SPS, except at a few special positions which cover less than 5% of the ring circumference. The specified pumping time is much shorter than the time it usually takes for an unbaked vacuum system to reach its limit pressure. The pressure thus continues to fall for roughly 3 months from the beginning of a pumpdown and finally settles at about 7.10^{-10} mbar. (1 ref.)

99117 Sample manipulator for operation between 20 and 2000K in ultrahigh vacuum. E.E.Chaban, Y.J.Chabal (Bell Labs., Murray Hill, NJ, USA).
Rev. Sci. Instrum. (USA), vol.54, no.8, p.1031-3 (Aug. 1983).
The authors present a simple design for an ultrahigh vacuum (UHV) sample manipulator which allows rapid temperature changes from 2000 to 20K while maintaining *xyz* translations, rotation, and tilt capabilities. A mechanical heat switch is used between the cryogenic reservoir and the sample holder. The sample is kept electrically isolated at all times. A large thermal mass of the sample holder gives good temperature stability (1 K/h); yet temperature extremes can be obtained within a few minutes. (2 refs.)

99118 Simple ultrahigh vacuum transfer system for surface barrier detectors. S.P.Withrow, J.E.Weidley, P.S.Herrell (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Rev. Sci. Instrum. (USA), vol.54, no.8, p.1059-60 (Aug. 1983).
The design of an assembly to transfer a surface barrier detector into and out of a UHV chamber is described. (2 refs.)

99119 Ultrahigh vacuum apparatus for the optical study of thin films, in an energy range from 2 to 10.25 eV. R.Rivoira, J.P.Petrakian, B.Vidal (Faculte des Sci. et Tech., CECM, Marseille, France).
Vide les Couches Minces (France), vol.38, no.215, p.13-19 (Jan.-Feb. 1983). In French. [received: July 1983]
An experimental arrangement is described to allow the preparation and the optical study of metallic thin films under ultrahigh vacuum for an energy range from 2 to 10.25 eV. In this range, particular attention must be paid to surface roughness which induces diffuse scattering and surface plasmon resonance. In order to test the apparatus the spectral variations of a rough deposit of aluminium chosen for its sensitivity to the mentioned phenomena was presented. A comparison with previous data is given to check the performances of this experimental set up. (10 refs.)

07.30C Vacuum pumps

99120 Applications of vacuum technology to novel accelerator problems. E.L.Garwin (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2758-62 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Vacuum requirements for electron storage rings are most demanding to fulfill, due to the presence of gas desorption caused by large quantities of synchrotron radiation, the very limited area accessible for pumping ports, the need for 10^{-9} torr pressures in the ring, and for pressures a decade lower in the interaction regions. Design features of a wide variety of distributed ion sublimation pumps (DIP) developed at SLAC to meet these requirements are discussed, as well as NEG (non-evaporable getter) pumps tested for use in the Large Electron Positron Collider at CERN. Application of DIP to much higher pressures in electron damping rings for the Standard Linear Collider are discussed. (10 refs.)

99121 Investigations on pumping speed and compression work of liquid ring vacuum pumps. U.S.Powle, S.Kar (Dept. of Mech. Engng., Indian Inst. of Technol., Bombay, India).
Vacuum (GB), vol.33, no.5, p.255-63 (May 1983).
Liquid ring vacuum pumps are used to create coarse vacuum. Very limited theoretical work has been reported on these vacuum pumps. In the present work, an attempt is made to develop an equation for pumping speed as a function of free air displacement conditions, vapour pressure of the sealant liquid, pressure and index of expansion process in the system to be evacuated and index z representing the set of operating conditions. Analysis is carried out for compression work for isothermal systems. Expressions are developed for the pressure at which the compression work is maximum and its dependence on various parameters is studied. Theoretical derivations are compared with the experimental work carried out and the dependence of index z on various operating conditions is studied. The theoretical equations are also compared with theoretical and experimental studies of other investigators. The analysis presented will help in understanding the performance characteristics of these vacuum pumps. (10 refs.)

99122 Sorption of active gases by non-evaporable getter. S.Parkash, P.Vijendran (Tech. Phys. Div., Bhabha Atomic Res. Centre, Bombay, India).
Vacuum (GB), vol.33, no.5, p.295-9 (May 1983).
The behaviour of St 101 getter towards the sorption of active gases like oxygen, carbon dioxide, carbon monoxide, background water vapour and nitrogen at 10 torr pressure have been studied gravimetrically at 400°C and at other temperatures. A Cahn RG electrobalance has been used in the above studies. The sorption by ST 101 getter has been compared with that of Zr powder. The sorption law and the reaction mechanism are also discussed. (12 refs.)

99123 A heavy-duty turbomolecular pump. D.G.Gotz, H.-H.Henning (Leybold-Heraeus GmbH, Koln, Germany).
Vak.-Tech. (Germany), vol.32, no.5, p.130-5 (July 1983). In German.
A recently developed grease-lubricated turbomolecular pump, designated TURBOVAC 1000, is introduced. Its construction is described whereby special demands as asked for in a variety of industrial applications have been taken into consideration. The technical data of the pump are presented and discussed in detail. It becomes clear that the use of this particular pump is not only confined to industrial applications—though mainly designed for them—but also fulfils conventional duties turbomolecular pumps are well known for. (4 refs.)

99124 Use of turbomolecular pumps in the rough- and medium vacuum range during the pump-down phase. E.Kellner, W.Czech (Fachbereich fur Phys., Tech. Univ., Munchen, Garching, Germany), H.-H.Henning, D.Urban.
Vak.-Tech. (Germany), vol.32, no.5, p.136-9 (July 1983). In German.
Pump-down experiments were carried out at the Technical University in Munich where turbomolecular pumps had been operative already in the rough- and medium vacuum range. The respective pump-down curves for various vacuum pump systems show that turbomolecular pumps do contribute considerably to the pumping speed in the continuum-flow range. The recently developed pump TURBOVAC 1000 manufactured by Leybold-Heraeus appears to be very suitable for this type of duty. (no refs.)

99125 Advanced operation of Roots pumps. H.-D.Burger (CIT-ALCATEL GmbH, Wertheim, Germany).
Vak.-Tech. (Germany), vol.32, no.5, p.140-7 (July 1983). In German.
The problem of an 'absolutely oilfree pumping chamber' of Roots-type vacuum pumps is examined and discussed. Improvements for the smallest possible hydrocarbon-concentration in the Roots pumps are suggested. For the simultaneous solution of the problems of pressure regulation and starting of the Roots pump at atmospheric pressure the application of a DC-motor drive is described. To avoid rotational feedthrough of the driving shaft and to conserve at the same time the advantages of the DC-motor drive a small size magnetic coupling is shown. (no refs.)

07.30D Vacuum meters

99126 Modulating ion current pressure gauge. F.Watanabe (Sakura-no-Seibo Gakuin High School, Fukushima-shi, Japan), S.Hiramatsu, H.Ishimaru.
Vacuum (GB), vol.33, no.5, p.271-8 (May 1983).
A remote pressure measurement system suitable for ultra-high vacuum in a very severe noise environment, such as found in high energy accelerators, is reported. The pressure in a beam pipe of the 12 GeV proton synchrotron at the National Laboratory for High Energy Physics has been measured with high accuracy by a newly developed hot-cathode extractor type ionization gauge, here called the modulating ion current gauge. The output signal from the gauge head was sent to the synchrotron subcontrol room by a 120 m long cable and the measurement was carried out with full beam in the synchrotron. The miniaturized gauge head has a hemispherical mesh anode and a cylindrical electrode between the ionization region and the ion-collector to modulate the ion current. The modulated signal is sent to an amplifier via a double shielded coaxial cable and after amplification is detected with a phase sensitive detector. This new gauge can reject externally induced noise. The effects both of ions desorbed by electron-impact from the anode and of X-ray photocurrents from the ion-collector can also be avoided. (10 refs.)

99127 Manometer for measuring pressures between 1.10^{-3} and 1000 mbar. J.Morel (CIT-ALCATEL, Annecy, France).
Vide les Couches Minces (France), vol.38, no.217, p.301-7 (May-July 1983). In French.
Thermal-conductivity gauges are those most currently used for measuring high vacuum. In order to use them on a large pressure scale ($1.10^{-3}-1000$ mbar) the authors have developed a machine combining natural convection with a Pirani gauge. When used with gases other than air, this machine must be utilised with care because of the variations of sensitivity according to the composition of the gas mixture. (22 refs.)

07.50 ELECTRICAL INSTRUMENTS AND TECHNIQUES

99128 Dielectric anisotropy of nematic liquid crystals at centimeter wavelengths. P.Sura (Katedra Experimentalnej Fyziky MFF UK, Bratislava, Czechoslovakia).
Acta Phys. Slovaca (Czechoslovakia), vol.33, no.4, p.265-72 (1983).
The method of measuring dielectric anisotropy on five thermotropic liquid crystals in the K microwave band and the attained results are presented. (5 refs.)

99129 Investigation of an electrodeless technique for the estimation of the electrical conductivity at high temperatures. G.Wollenberg, M.Wobst (Tech. Hochschule Karl-Marx-Stadt, Karl-Marx-Stadt, Germany).
Exp. Tech. Phys. (Germany), vol.31, no.3, p.227-38 (1983). In German.
With this method the sample falls through the solenoid of a high frequency oscillator. The origin of the electrical measurement values was mathematically investigated, if the conductivity σ varies above several orders of magnitude. The results yield instructions for dimensioning and dimensional stability of this measurement technique. An electro-analogic calibration method was derived and experimentally proved for this range of conductivities with purely real impedance of the solenoid. (19 refs.)

99130 Reliability of conductometers MK-3 and PK 80 MS. J.Muciek (Inst. Metrologii Elektrycznej, Politech. Wroclawskiej, Wroclaw, Poland).
Pomiary Autom. Kontrola (Poland), vol.29, no.1, p.6-7 (Jan. 1983). In Polish.
Procedure and results of reliability tests of conductometers MK-3 and PK 80 MS are presented. Reliability indices of the instruments under test, a mean failure rate, and a mean failureness operation time have been determined. Values of the indices have been established analytically on the basis of the design features, mechanics, and number of elements, and also experimentally through accelerated reliability tests involving checks on correct operation of the conductometers. (5 refs.)

99131 Contactless determination of the conductivity in semi-insulators. P.Muller (Zentralinst. fur Elektronenphys., Akad. der Wissenschaften, Berlin, Germany).
Phys. Status Solidi a (Germany), vol.78, no.1, p.41-51 (16 July 1983).
It is shown how isothermal relaxation current measurements on MISM or MISM multilayer structures can be used to determine the specific conductivity of materials in the range of about 10^{-12} to 10^{-5} Ω^{-1} cm^{-1}. Using a boxcar integrator for measuring the current-time signals, the proposed method is applied to investigate the properties of semi-insulating GaAs and of AgBr at room temperature. In accordance with the expectations in the case of semi-insulating GaAs with increasing voltages a perceptible carrier depletion in the bulk takes place. From the polarity dependence of the extraction effect conclusions can be drawn about the predominant conduction mechanism. (20 refs.)

99132 Surface acoustic-wave device for measuring high voltages. S.G.Joshi (Dept. of Electrical Engng. & Computer Sci., Marquette Univ., Milwaukee, WI, USA).
Rev. Sci. Instrum. (USA), vol.54, no.8, p.1012-16 (Aug. 1983).
A surface acoustic-wave (SAW) device for measuring high voltages is described. The device consists of two SAW oscillators fabricated on a 128° rotated *Y*-cut $LiNbO_3$ substrate. The voltage to be measured is applied to one of the oscillators while the other oscillator acts as the reference oscillator for temperature compensation purposes. The frequency of the perturbed oscillator varies linearly with the applied voltage. An oscillator fabricated on a 0.5-mm-thick substrate can withstand greater than 9 kV of voltage giving a fractional frequency deviation greater than 1630 parts per million. Attractive features of this technique include: (1) direct measurement of high voltages without the need for resistive or capacitive voltage dividers, (2) very high input resistance, (3) direct conversion of voltage to frequency, and (4) resolution better than 0.01% of full scale. This paper will discuss the basic operation and present experimental data on the performance of the device. A technique for obtaining improved temperature compensation in SAW sensors will also be presented. (12 refs.)

99133 Optimization of a clip-on SQUID current probe. M.C.Leifer (Dept. of Phys., Stanford Univ., Stanford, CA, USA), J.P.Wikswo,Jr..
Rev. Sci. Instrum. (USA), vol.54, no.8, p.1017-22 (Aug. 1983).
This paper presents details of an unusual clip-on nanoammeter. The device utilizes a toroidal magnetic flux sensor which is split to allow its placement around a continuous current carrying filament, and is coupled to a sensitive superconducting current amplifier. Optimization formulas allow the design of an instrument having the greatest possible signal-to-noise ratio consistent with the physical volume available for the sensing element. A prototype exhibited 125-nA current sensitivity at 25 Hz with a noise level of 40 $nA/Hz^{1/2}$. The performance of this instrument verified the predictions of the theory. The optimization analysis for this probe demonstrated that the signal-to-noise ratio could have been doubled by a slight change in toroid dimensions. It was shown that SQUID noise is negligible for this instrument, justifying the assumption of a noiseless amplifier in the original calculation. Finally, the conditions under which an impedance matching transformer can reduce the importance of the SQUID noise relative to the Johnson noise are derived, and the required inductances are given. (7 refs.)

99134 Subnanosecond high-voltage two-stage resistive divider. Z.Y.Lee (Dept. of Electrical Engng. & Electronics, Univ. of Liverpool, Liverpool, England).
Rev. Sci. Instrum. (USA), vol.54, no.8, p.1060-2 (Aug. 1983).
A simple, easily constructed, two-stage $CuSO_4$ solution 'tube' resistive divider for measuring high-voltage ns pulses has been developed. The test results for the divider showed that it was capable of maintaining pulse rise times less than 1.5 ns, and the hold-off voltage for pulses with rise times less than 5 ns was above 120 kV. (7 refs.)

99135 Linearization of volt-watt characteristics of Hall-effect power meters. A.M.Konin (Inst. of Semiconductor Phys., Acad. of Sci., Lithuanian SSR).
Sov. Phys.-Collect. (USA), vol.22, no.2, p.50-2 (1982). Translation of: *Litov. Fiz. Sb. (USSR)*, vol.22, no.2, p.64-7 (1982).
A method is proposed such that, given that the microwave Hall EMF is compensated for by external electric and magnetic fields, it is possible to obtain a linear relationship between the voltage applied to the sensor and the microwave power. This is achieved by choosing a certain length of the sensor. High temperature stability of the method is predicted. (5 refs.)

99136 Use of an immersion method to measure the dielectric constant of glassy semiconductors. M.S.Gutenev, I.N.Blinov (M.I. Kalinin Leningrad Polytech. Inst., Leningrad, USSR).
Sov. J. Glass Phys. & Chem. (USA), vol.8, no.4, p.299-303 (July-Aug. 1982). Translation of: *Fiz. & Khim. Stekla (USSR)*, vol.8, no.4, p.439-44 (July-Aug. 1982). [received: May 1983]
The promising nature of the immersion method for measuring the dielectric constant of glassy semiconductors is demonstrated. The limits of applicability of this method are defined; the relationship between the measurement frequency and the critical value of the electrical conductivity at which the measured value of the dielectric constant is still correct has been considered; the effect of various factors on the results of the experimental measurement of the dielectric characteristics has been analyzed. An evaluation of the value of the frequency corresponding to the beginning of the dispersion of capacitance is in good agreement with the experimentally measured values. (8 refs.)

07.55 MAGNETIC INSTRUMENTS AND TECHNIQUES

99137 Superconducting laboratory magnets. J.Bankuti, L.Laszloffy (Dept. for Low Temperature Phys., Roland Eotvos Univ., Budapest, Hungary).
Acta Phys. Acad. Sci. Hung. (Hungary), vol.53, no.3-4, p.445-53 (1982). [received: Aug. 1983] (CRYOSEM '81. Second International Seminar on Low Temperature Physics, Visegrad, Hungary, 8-10 Oct. 1981).
Superconducting magnets were constructed for different investigations of magnetic phenomena. The magnetic field of this series ranges from 1.5 kOe to 72.6 kOe. By the volume minimalization of each magnet the authors have developed these with little helium consumption. In some cases their aim was to reach high homogeneity using a graphical interpolation technique with computer. (9 refs.)

99138 The NBS-LANL RTM end-magnet field mapper. E.R.Lindstrom, P.H.Debenham, D.L.Mohr, N.R.Yoder (NBS, Washington, DC, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3605-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A computer-controlled magnetic field mapper is under construction at the National Bureau of Standards to map the end magnets of the NBS-LANL racetrack microtron (RTM). The mapper consists of a large, two-dimensional translation stage which simultaneously positions a nuclear magnetic resonance (NMR) magnetometer probe in the 55 cm×135 cm uniform field region and a temperature-compensated Hall effect probe in the fringe field region. A computer-based control system automatically positions the probes at points on a selected grid and records the measured field values and positions in computer memory. The authors describe the field mapping requirements, the mapper, its operation, and the field measurements and analysis that are to be performed. (5 refs.)

99139 Report on the production magnet measurement system for the Fermilab Energy Saver superconducting dipoles and quadrupoles. B.C.Brown, W.E.Cooper, J.D.Garvey, D.A.Gross, R.Hanft, K.P.Kaczar, J.E.Pachnik, C.W.Schmidt, E.E.Schmidt, F.Turkot (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3608-10 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The measurement system and procedures used to test more than 900 superconducting dipole magnets and more than 275 superconducting quadrupole magnets for the Fermilab Energy Saver are described. The system is designed to measure nearly all parameters relevant to the use of the magnets in the accelerator including maximum field capability and precision field measurements. The performance of the instrumentation with regard to precision, reliability, and operational needs for high volume testing described. (8 refs.)

99140 T_1, nuclear Overhauser effects measurements in ^{13}C NMR spectroscopy: analytic relations for short equilibration delays. V.Leon (Centro de Fisica, Inst. Venezolano de Investigaciones Cientificas (IVIC),,Venezuela). Caracas.
Appl. Spectrosc. (USA), vol.37, no.4, p.357-60 (July-Aug. 1983).
Anaylytic relations that describe magnetization as a function of time are given for several dynamic nuclear Overhauser effects (NOE) experiments. They allow the extraction of spin-lattice relaxation times (T_1) and NOE (η) from a three-parameter fitting of experimental data. These results are valid even for short equilibration delays if the saturated protons have a much shorter relaxation time than the observed ^{13}C. A simple pulse sequence that combines a progressive saturation experiment with gate decoupling is proposed for measuring T_1 and η values. The calculated η values are a good approximation even for short equilibration delays without any restrictive assumptions about relaxation times of the nuclei involved. (9 refs.)

99141 Separate measurements of heteronuclear *J* coupling constants by manipulated polarization transfer in two-dimensional NMR. V.Rutar (Dept. of Chem., Univ. of Missouri, Columbia, MO, USA).
J. Am. Chem. Soc. (USA), vol.105, no.12, p.4095-6 (15 June 1983).
Scalar spin-spin (J) coupling constants between ^{13}C and ^{1}H nuclei are very important for molecular identification and conformational analysis. Two-dimensional (2-D) J-resolved spectoscopy separates chemical shifts and coupling constants, thus avoiding the overlapping of multiplets that occurs in one-dimensional coupled NMR spectra. Although the 2-D approach simplifies interpretation and also improves resolution, only few practical applications have been reported, because typically 1000 data sets have to be acquired and processed to obtain competitive results. Measuring times can be shortened by approximately 10 times by adopting the new strategy described by the author together with the first successful application. (9 refs.)

99142 Nuclear magnetic double resonance: the use of difference spectroscopy. J.K.M.Sanders, J.D.Mersh (Univ. Chem. Lab., Cambridge Univ., Cambridge, England).
Prog. Nucl. Magn. Resonance Spectrosc. (GB), vol.15, pt.4, p.353-400 (1982).
The authors outline the double resonance difference techniques which are available, and show how careful experimental design can maximise the useful information content of difference spectra, and describe a selection of chemical and biochemical applications. Only Fourier transform (FT) techniques are described. The emphasis is largely but not exclusively on proton NMR. (203 refs.)

99143 Determining the optical constants of high index thin films (II-VI compound thin film) with optical waveguides. K.Sasaki (Faculty of Sci. & Technol., Keio Univ., Tokyo, Japan).
Oyo Buturi (Japan), vol.52, no.3, p.237-8 (March 1983). In Japanese.
Ellipsometry, Abeles', Male's and other methods for determining optical constants of thin films have been extensively discussed in the literature and a number of review articles have been written concerning them. The author briefly describes his method for determining optical constants of II-VI semiconductor thin-films. Unlike other methods, the author's method does not need to perform complicated calculations using an electronic computer; the method can provide the refractive index of test films by finding the propagation constant, which depends on the geometry of the substrate and unimode guided wave path, and by measuring the resonance film thickness. The main difficulty in using the method is to prepare an accurately-tapered test film. (5 refs.) *K.B.*

99145 Evaluation of effective emissivities of nonisothermal cavities. Y.Ohwada (Nat. Res. Lab. of Metrology, Ibaraki, Japan).
Appl. Opt. (USA), vol.22, no.15, p.2322-5 (1 Aug. 1983).
Local effective spectral and total emissivities of nonisothermal cavities having diffuse surfaces are evaluated. The effective emissivity of the cavity wall around the half-depth of a cylinder is little affected by a linear decrease or increase of temperature along the axis because of a compensation effect. The nonisothermal effect on the integrated cavity emissivity changes considerably with cavity geometry for a given temperature distribution. (10 refs.)

99146 Wavelength precision of a Cary model 14R spectrophotometer. M.E.Hills (Res. Dept., US Naval Weapons Center, China Lake, CA, USA).
Appl. Opt. (USA), vol.22, no.15, p.2326-8 (1 Aug. 1983).
The precision of wavelength measurements made with a Cary model 14R spectrophotometer was determined using the D_β line of the deuterium lamp of the instrument as a standard. The wavelength of the line as measured by the instrument was found to depend upon the manner in which the instrument was operated. (3 refs.)

99147 Measurement standards of light and radiation. N.Oba.
J. Soc. Instrum. & Control Eng. (Japan), vol.22, no.3, p.315-20 (March 1983). In Japanese.
In employing methods that obtain the best measured value, it is obvious that the standard plays an important role in the measurement process and in the factor of confidence in the resultant value. This paper describes standard sources of light and radiation, and contains a description of blackbody radiators, synchrotron orbital radiation, absolute radiometers, standard luminous intensity, standard luminous flux, and problems in measuring light. (14 refs.) *K.B.*

99148 Characteristics of the use of silicon photodiodes in pulse photometry. S.G.Garasevich, Yu.A.Myagchenko, S.I.Osipov, A.V.Slobodyanyuk.
J. Appl. Spectrosc. (USA), vol.37, no.4, p.1178-80 (Oct. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.4, p.628-30 (Oct. 1982).
Silicon photodiodes are small and have low feed voltages, high mechanical strength, and stability of sensitivity for many thousands of pulses. Such properties give them a number of advantages over other photodetectors used in laser technology and laser spectroscopy, e.g. for measurement of the parameters of near-IR radiation pulses, in various synchronization circuits, etc. The comparatively low speed of such highly popular serially produced photodiodes as FD-7K, FD-18K, and FD-24K imposes certain restrictions on their use as photodetectors for nanosecond-range pulse photometers. Since the photodiodes mentioned and photodiodes similar to them have significant detecting surface dimensions, one can expect the existence of a relation of the parameters of the output electric signal to the position of the light spot on the detecting surface. This pertains primarily to photodiodes with asymmetric arrangement of electrodes. The existence of such a relation makes it possible in principle to improve the parameters of the output pulse signal by optimal choice of the cross section and the position of the light spot on the detecting surface of the photodiode. The authors have studied the coordinate relations of the response of the photodiodes to short radiation pulses ($\sim 10^{-8}$ sec). (3 refs.)

99149 Key features in densitometry.
Lab. Pract. (GB), vol.32, no.7, p.43-4 (July 1983).
The characteristics of scanning densitometers are discussed and systems which are available on the market are surveyed. Criteria which should be considered by purchasers include the optical system, the instruments' electronic capabilities, and the sample gel holder and sample application methods. (no refs.)

99150 A model of a standard operational radiometer for the visible and infrared [ranges]. G.Ispasoiu, I.Toma, V.Dragan (Inst. Nat. de Metrologie, Bucuresti, Rumania), M.Ciocirlan.
Metrol. Apl. (Rumania), vol.30, no.1, p.21-5 (1983). In Rumanian.
General aspects of radiometric magnitudes and methods for their measurement are discussed, particular attention being paid to the energy aspects of illumination, e.g. spectral density, flux energy, spectral efficiency, etc. A description of a particular radiometer, the RAVIR A-77, which is designed for measurement of illumination intensity and luminance in the 0.5 to 12 μm spectral range is presented. Principal components of the circuit are discussed, e.g. the thermocouple, operational amplifier, and the microammeter for the readout. A future digital instrument is also considered. (10 refs.) *C.J.R.*

99151 Improving the accuracy of absolute measurements in a photometric sphere. M.A.Bukhshtab.
Opt. & Spectrosc. (USA), vol.54, no.1, p.90-3 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.158-63 (Jan. 1983).
A method is proposed for canceling the systematic error in absolute measurements of various light modification coefficients in a photometric sphere by arranging a partial illumination of the photodetector by light directly reflected or transmitted by the test object. Expressions are derived for the transmission coefficient of the shading screen or the illuminated area of the detector for various cases. The additional errors in such devices are shown to be small quantities of second order in comparison with the measurement errors by the Taylor method. Experiments confirm that highly accurate measurements can be taken in a sphere with incomplete screening. (7 refs.)

99152 Colorimetric effectiveness value of light sources. W.Stanioch.
Pr. Inst. Elektrotech. (Poland), vol.31, no.123, p.47-74 (1983). In Polish.
The paper presents a method of determining a novel parameter characterising the quality of light sources, i.e. their colorimetric effectiveness value. The latter determines to what degree does the relative spectral distribution of the light of lamps influence the chromatic contrast level of viewed objects which is an essential factor of the visibility level. The results of a verification of the method, made by means of psychophysical observation of coloured samples, are quoted. The presented method is intended for application in light engineering with the use of computers and completes the present methods, mainly, that concerning the colour rendition index. (2 refs.)

99153 Sensitivity and time constant of thin film thermopile radiometer with radial geometry. A.Septier, C.Machet (Conservatoire Nat. des Arts et Metiers, Paris, France).
Rev. Phys. Appl. (France), vol.18, no.8, p.507-14 (Aug. 1983). In French.
Using a simple model, sensitivity and time constant of a thermopile made of semiconducting thin thermoelements with a radial symmetry and operating in a vacuum, have been calculated. The radiation flux, collected by a metal disc covered with a thick layer of gold black, flows to the heat reservoir at constant temperature T_0 surrounding the receiver by conduction and thermal radiation. A flux sensitivity $S_\phi=68.5$ V W^{-1} and a time constant $\tau=0.76$ s have been obtained, in good agreement with experiments. (13 refs.)

99154 Photometer for quasielastic and classical light scattering. H.R.Haller, C.Destor, D.S.Cannell (Dept. of Phys., Univ. of California, Santa Barbara, CA, USA).
Rev. Sci. Instrum. (USA), vol.54, no.8, p.973-83 (Aug. 1983).
An accurate light scattering photometer capable of measuring both the angular distribution of intensity and the intensity fluctuation spectrum of laser light scattered from a wide variety of samples including solutions of polymers and other macromolecules is described. The photometer employs 18 fixed scattering angles ranging from 2.6° to 163° and is sufficiently accurate to measure a molecular radius of gyration as small as 60 Å reliably. Stray elastically scattered light normally comprises less than 1% of the light scattered from pure toluene at the smallest scattering angle and is unmeasurable at other angles. The apparatus employs optical fibers to transmit the scattered light to a single photomultiplier tube and functions automatically under microprocessor control, with sample temperature controlled to ±0.1 mK. (16 refs.)

99155 Colorimetry for fluorescent materials. H.Minato.
Res. Electrotech. Lab. (Japan), no.829, p.1-98 (Oct. 1982). In Japanese.
A practical measuring method is established for accurate prediction of colours of fluorescent materials under arbitrary illuminants. The two-monochromator method, considered to be the most accurate method in principle, is first investigated. Then the one-monochromator method is investigated based on the evaluation mode by the two-monochromator method. Spectral characteristics of fluorescent and non-fluorescent materials are described. A method for accurate determination of the reflected spectra radiance factor in the overlapping region in spectral colorimetry for fluorescent materials is given, and the effect of polarisation of the measuring system studied. Two methods are proposed for accurate estimation of the relative spectral integrating sphere efficiency, which plays an important role in the colorimetry for fluorescent materials by means of conventional colour-measuring spectrophotometers. (47 refs.)

99156 A system for controlling the luminance stability of colour temperature reference lamps. Klochkova O.A., D.I.Chetvergov.
Svetotekhnika (USSR), no.6, p.7-8 (1983). In Russian.
A system intended for controlling the stability of the radiant parameters of colour temperature reference lamps has been developed. To obtain convergent measurement results, use was made of the optical system including lenses, a turning mirror and an interchangeable reflecting prism. Total measurement errors were calculated. (6 refs.)

07.60F Polarimetry and ellipsometry

99157 Simple and direct determination of complex refractive index and thickness of unsupported or embedded thin films by combined reflection and transmission ellipsometry at 45° angle of incidence. R.M.A.Azzam (Dept. of Electrical Engng., Univ. of New Orleans, New Orleans, LA, USA).
J. Opt. Soc. Am. (USA), vol.73, no.8, p.1080-2 (Aug. 1983).
Measurements of the polarisation states (represented by complex numbers χ_r and χ_t, respectively) of light reflected and transmitted by an unsupported or embedded thin film, for totally polarised light (with nonzero p and s components) incident at 45°, permit simple, direct, and explicit determination of the film's complex refractive index N_1 independently of film thickness or input polarisation. If $\alpha=\chi_r/\chi_t$, the author finds that $\alpha=r_s+r_s^{-1}$, where r_s is Fresnel's complex reflection coefficient of the ambient-film interface for the s polarisation at 45° incidence. From α, r_s is determined, and from r_s one gets $N_1=N_0(1+r_s^2)^{1/2}/(1+r_s)$, where N_0 is the refractive index of the transparent medium surrounding the film. Knowledge of the incident polarisation χ_i allows the film thickness to be determined, also explicitly, by using either of the ratios χ_i/χ_r or χ_i/χ_t. (10 refs.)

99158 Calibration and error analysis in rotating analyzer ellipsometers. T.Hoshino, A.Moritani, J.Nakai (Dept. of Electronic Engng., Osaka Univ., Suita, Japan).
Oyo Buturi (Japan), vol.52, no.5, p.443-50 (May 1983). In Japanese.
An accurate calibration method taking account of imperfections in optical components is described for rotating analyzer ellipsometers. Precision and accuracy are discussed in detail for both stationary and time-varying ellipsometric parameters, Ψ and Δ, in rotating analyzer ellipsometry. An application of the present method to the study of anodic film growth on Bi_2Te_3 is shown. (15 refs.)

99159 Ellipsometric method of determining the quality of surface processing. A.V.Rzhanov, S.N.Svitasheva, K.K.Svitashev, V.K.Sokolov, Yu.V.Ashkerov, L.A.Osadchev, L.S.Tsesnek (Inst. of Semiconductor Phys., Acad. of Sci., Novosibirsk, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.967-9 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.373-7 (Nov. 1982).
By studying the polarization of a reflected light beam one can obtain detailed information on the properties of reflecting surfaces. As the quality of the polishing improves, the abrupt changes in the apparent values of n and k as functions of the angle of incidence should vanish, and this is seen in the experiment. The proposed method provides an objective quantitative basis for comparison of the quality of surface processing for samples of a material with standard characteristics for the material and, without requiring expensive instrumentation or a highly trained staff, permits contactless and nondestructive monitoring. 99160 Vacuum-ultraviolet refractive index of LiF and MgF_2 in the temperature range 80-300K. P.Laporte, J.L.Subtil, M.Courbon, M.Bon (Equipe de Spectroscopie, CNRS, Saint-Etienne, France), L.Vincent.
J. Opt. Soc. Am. (USA), vol.73, no.8, p.1062-9 (Aug. 1983).
The refractive indices of LiF and MgF_2 have been measured with an accuracy better than ±0.003 from 200 nm down to their respective cutoff wavelengths for various temperatures ranging from 80 to 300K. For LiF, the temperature coefficient changes sign at 160 nm. The data were fitted to a two-term dispersion equation. The corresponding oscillator strength values for the exciton peak (0.45 and 0.69 for LiF and MgF_2, respectively) are in agreement with existing data. (24 refs.)

99161 New graphical method for the determination of the optical constants of thin films. A.A.El-Shazly, H.T.El-Shair, M.M.El-Nahass (Faculty of Education, Ain Shams Univ., Cairo, Egypt).
J. Opt. (India), vol.12, no.1, p.6-7 (Jan.-March 1983).
A new graphical method for the determination of the components n and k of the complex refractive index of a thin absorbing films is proposed. The method utilises reflectance and transmittance measured at normal incidence. (7 refs.)

99162 Selective counting path to Young's fringes in speckle photography for eliminating diffraction halo effects. C.S.Vikram, K.Vedam (Materials Res. Lab., Pennsylvania State Univ., University Park, PA, USA).
Appl. Opt. (USA), vol.22, no.15, p.2242-3 (1 Aug. 1983).
Along with the whole field filtering approach, the pointwise method utilizing Young's fringes is very common in speckle photography for the analysis of lateral object motion or displacement. In this the diffraction halo is modulated by a fringe pattern (Young's fringes) that is used for analysis. Until recently, it has been the practice to ignore the effect of the diffraction halo intensity variation on the fringe positions. However, the halo intensity variation does alter the fringe position significantly resulting in error if the effect is not accounted for. The present methods involve eliminating the effect of the halo by complicated electronic techniques or analytical methods. Both these approaches significantly complicate a remarkably simple instrumentation or analysis on both. The authors propose to eliminate this dilemma by an altogether new and simple approach. The entire problem is due to the normal practice (which is very common in optics) of observing the fringes along a direction perpendicular to their orientation. In what follows, the authors show that a slight deviation from this practice can simply eliminate the halo effects as far as positions of fringe maxima and minima are concerned. Thus one can work without complicated instrumentation or analytical tools. (7 refs.)

99163 Fourier transform Michelson interferometer for the far infrared. Y.Shibata, T.Tsutaya, S.Takahashi (Res. Inst. for Sci. Measurements, Tohoku Univ., Sendai, Japan).
Bull. Res. Inst. Sci. Meas. Tohoku Univ. (Japan), vol.31, no.2-3, p.91-108 (1982). In Japanese.
A Fourier transform Michelson interferometer for the far infrared was constructed. The construction and performance of this handy interferometer are described. The focal length of the spherical collimating mirror is 30 cm and the aperture 10 cm in diameter. The maximum optical path difference is 10 cm. With a Golay detector, the resolution achieved is about 0.1 cm^{-1}, the operational reproducibility ±5%, and the accuracy of the wavenumber ±0.2 cm^{-1}. Illustrative spectra of water vapor are given. (10 refs.)

99164 Analysis of Young's fringes in speckle photography: generalised square imaging aperture. C.S.Vikram (Materials Res. Lab., Pennsylvania State Univ., University Park, PA, USA).
Appl. Phys. B (Germany), vol.B31, no.4, p.221-4 (Aug. 1983).
Processing speckle photography data using Young's fringes method is described when a square imaging aperture is used. The direction of the lateral motion and hence the fringe orientation is assumed to be general. The cases considered are step motion (double-exposure) and sinusoidal vibration in time-average manner. (16 refs.)

99165 Method of fabrication and photographic characteristics of the Fabry-Perot type photosystems. D.Saint-Germain, G.Boivin (Dept. de Phys., Univ. Laval, Quebec City, Quebec, Canada).
Can. J. Phys. (Canada), vol.61, no.8, p.1212-17 (Aug. 1983).
The use of a Fabry-Perot filter as a positive transmission photosystem is discussed first. Its construction is similar to an interference filter with multistacked mirrors. A lead-iodide and copper photosensitive element is made in

such a way as to be combined with the multistacked mirrors. They then propose a method to fabricate the filter which is independent of the refractive indices of the materials. Finally, the authors present the sensitivity and contrast results of the photosystems. (13 refs.)

99166 Speckle and its application to strain sensing. K.A.Stetson (United Technologies Res. Center, East Hartford, CT, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.353, p.12-18 (1983). (Industrial and Commercial Applications of Holography, San Diego, CA, USA, 24-25 Aug. 1982).
Discusses ways in which laser speckles may be used to determine strain on the surface of an object. This may be done either by measuring variations in speckle displacement across a specklegram, or by measuring the slewing of the speckle field relative to the object surface. The latter method required the use of tandemly recorded specklegrams, and, although data processing is time consuming, it yields a complete solution for the surface strain rotation matrix. The first method is effective when the surface is observed in focus, along the surface normal, but it suffers serious problems when a significantly contoured surface is considered. Equations are derived that relate the derivatives of observed speckle displacements to surface strains and rotations as a function of illumination and observation direction and variations in defocusing. (13 refs.)

99167 Automated data reduction for speckle metrology. G.E.Maddux (Air Force Wright Aeronautical Labs., Wright-Patterson AFB, OH, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.353, p.19-23 (1983). (Industrial and Commercial Applications of Holography, San Diego, CA, USA, 24-25 Aug. 1982).
Speckle Metrology has transitioned from a laboratory curiosity to a useful engineering tool. It is now in a stage where some means is required to process the enormous amount of data it is capable of generating. The author explores the requirements and characteristics for an automated data reduction system. Examples are given of current operational systems and what direction future system developments may take. (10 refs.)

99168 White light optical processing of speckle interferograms. F.T.S.Yu, P.H.Ruterbusch (Dept. of Electrical Engng., Pennsylvania State Univ., University Park, PA, USA), G.R.Gerhart.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.353, p.90-5 (1983). (Industrial and Commercial Applications of Holography, San Diego, CA, USA, 24-25 Aug. 1982).
A technique of white-light color encoding of misfocused speckle interferometric fringe patterns is presented. The encoding is performed in the spatial frequency plane with color filters. This technique allows the viewing of a multiset of encoded speckle interferograms simultaneously. Thus it may provide new information on the interferometric aspects of the object under stress or vibration. The effect on the speckle fringe pattern due to the spatial filtering is briefly discussed and experimental demonstrations of color encoded fringe patterns are presented. Due to the simplicity and versatility of the processing technique, the authors feel that the technique may develop into a practical tool for strain, stress and vibrational measurement. (10 refs.)

99169 Speckle-shear interferometry with double Dove prisms. R.K.Mohanty, C.Joenathan, R.S.Sirohi (Engng. Design Center, Indian Inst. of Technol., Madras, India).
Opt. Commun. (Netherlands), vol.47, no.1, p.27-30 (1 Aug. 1983).
A method for carrying out speckle-shear interferometry with θ-shear is discussed and applied to the study of eccentrically loaded diaphragms and cantilever beams. It is also shown that it can be used for the measurement of rigid body tilt. (14 refs.)

99170 Experimental determination of variations in optical-waveguide film thickness by the interference of scattering fields of modes with different polarization. A.Yu.Agapov, L.N.Deryugin, S.V.Zaitsev, A.V.Chekan.
Opt. & Spectrosc. (USA), vol.54, no.1, p.87-90 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.153-7 (Jan. 1983).
Feasibilities are considered for the determination of variations in the thickness of thin-film optical waveguides based on measurement of the width of the interference fringes of scattering fields of two waveguide modes with different polarization, TE and TM. The error of the method is calculated for waveguides with different refractive indices of the waveguide layers. Results of experimental studies on the variations of the thickness of polystyrene waveguide films on glass are given. (8 refs.)

99171 Autocollimation multibeam interferometer with spatial beam separation and its use in frequency selection of laser radiation. Yu.T.Mazurenko, Yu.A.Rubinov.
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.213-16 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.383-9 (Feb. 1983).
A new type of multibeam interferometer with side entrance of radiation is proposed. A theoretical analysis is made of a three-mirror autocollimation interferometer with side entrance and it is shown both theoretically and experimentally that such an interferometer can be used as an efficient selector of longitudinal modes in laser resonators. Such a longitudinal-mode selector has advantages over a Fabry-Perot etalon in the resonators of high-power tunable lasers. In lasers of this type the use of an autocollimation multibeam interferometer with spatial beam separation ensures a considerable reduction in the optical loading on the components of the laser system and on coatings of mirrors in the selector, and it makes it possible to use the Fresnel reflection effectively. 07.60P Optical microscopy

99172 Jenalumar—the fluorescence research microscope of the Jena-microscope series 250-CF. G.Borner, H.Bruch.
Jena Rev. (Germany), vol.28, no.2, p.59-60, 71 (1983).
The application of fluorescence microscopy covers many fields in science and technology and of increasing importance is fluorescence microscopy for biology and medicine. The Jenalumar provides for: fluorescence microscopy of wide fields with 170% increased information content compared with former microscopes; combination of fluorescence excitation with all other optical contrasting methods for simultaneous or alternative use; great flexibility of the fluorescence excitation by exchange of excitation sources and filters. The microscope user may choose between three Jenalumar standard outfits: Jenalumar-a/d is the fluorescence microscope for all common fluorescence techniques; Jenalumar-contrast is an extended version of the Jenalumar-a/d with a special contrast tube; Jenalumar-a has been designed for demanding routine fluorescence microscopy in incident light. All Jenalumar microscopes have, in addition, a built-in variable 6 V/25 W halogen lamp for use with other than fluorescence methods. (4 refs.)

99173 Jenapol polarizing microscope of the Jena-microscope series 250-CF. J.Bergner.
Jena Rev. (Germany), vol.28, no.2, p.61-3 (1983).
As polarized light microscopy is as important as ever in many scientific and technical fields of application for materials and structural analysis—the Jena-microscope series 250 CF also includes the Jenapol polarized light microscopes. Particular attention has been paid to the improvement of its optical performance regarding imaging quality and field of view in the orthoscope and conoscopic path of rays, the extension of usable polarized light methods and ease of operation, and the extension and optimization of the range of accessories for polarized light microscopy taking thereby advantage of the possibilities modern microelectronics offers. (6 refs.)

99174 The polarization optical digital compensator Retarmet. R.Werlich, J.Bergner.
Jena Rev. (Germany), vol.28, no.2, p.64-5 (1983).
The Retarmet instrument disposes of six polarization-optical compensation programmes and one length measuring programme. For statistical measurements with tilt compensators, one of the two compensation strips, which are formed in the microscope symmetrically to the zero position, are brought into alignment with the centre of the cross lines and the coordinated position of the angle-measuring device is set as zero point. By pressing the key, the path difference is calculated from the number of pulses determined by the counter up to the measuring of the second compensator strip. The measurement of the rotary compensators proceeds analogously, where the extinction position of the compensator plate serves as a reference point. Easy operation, high measuring frequency in kinetic processes and an amount of labour which is reduced up to 10% of that required formerly are characteristic features of the digital compensator Retarmet and make it a highly effective means of rationalization for polarization-microscopic measurements. (2 refs.)

99175 Wide-field planapochromats and special-type objectives for the Jena-microscope series 250-CF. H.Riesenberg.
Jena Rev. (Germany), vol.28, no.2, p.66-8 (1983).
The new-developed microscope objectives represent a systematic extension of the new generation of microscope optics developed since 1982 and complete the programme planned for transmitted-light microscopy as well as for fluorescence and polarization microscopy. With these wide-field planapochromats, objectives of the highest performance characteristics for the Jenaval microscope are made available. Additional objectives are adapted to special requirements and served as basic or supplementary equipment for the Jenalumar fluorescence microscope and the Jenapol polarizing microscope. Specific oil immersion objectives complete the programme of supplementary objectives which may be used with the different instruments of the Jena-microscope series 250-CF. Finally, suggestions are given how the well-known objectives with long working distance may be adapted to the microscopes of the new generation. (5 refs.)

99176 Contemplations on fluorescence photomicrography. H.Storz (Inst. for Clinical Immunology, Freidrich-Schiller-Univ., Jena, Germany).
Jena Rev. (Germany), vol.28, no.2, p.79-81 (1983).
Primarily, three essential problems have to be taken into account in fluorescence photomicrography: 1. Compared with other microscopic examination methods, the light intensities in fluorescence microscopy are very low. The so-called Scwarzschild effect occurs. 2. In dependence on their fluorescent intensity and thus also on the excitation intensity, fluorescent objects display a certain fading effect. 3. Fluorescent images are similar to dark field images, i.e. they are luminous objects on dark ground. This fact has to be taken into account when measuring or regulating the exposure time or also in the subjective rating of the object brightness. To test the Schwarzschild effect on film materials used in fluorescence microscopy, the author made several series of trial exposures, employing the bright field method at differing intensity steps. The optimum setting values for the Automatic Exposure Control BA 2 indicate that, in photomicrography and especially in fluorescence processes, the effective sensitivity of the films cannot directly be deduced from the film sensitivity stated on the film case. The intensities in the ranges 1/400 and 1/4000 were comparable with those of the most brilliant immunofluorescent

objects. The variation of the setting values results from the Schwarzschild effect. (6 refs.)

99177 Commercial image analysers and the characterization of microscopical images. S.Bradbury (Dept. of Human Anatomy, Univ. of Oxford, Oxford, England).
J. Microsc. (GB), vol.131, pt.2, p.203-10 (Aug. 1983).
This review surveys some of the current approaches to the characterization of microscopical images using commercially available image analysers. The role of image pre-processing and segmentation is considered, together with the characterization of images by optical density, as well as size and shape. The newer analysers are capable of investigating relationships between grey-levels in small areas of the image ('texture-analysis'); some of the descriptive approaches in this latter field are briefly outlined. (50 refs.)

99178 Two-point resolution with partially coherent illumination, and the relation between self-luminous and illuminated objects. J.Rienitz (Inst. of Sci. Microscopy, Univ. of Tubingen, Tubingen, Germany).
Microsc. Acta (Germany), vol.87, no.3, p.311-28 (May 1983).
For more than thirty years past the theory of microscopic image formation has been deepened and improved by means of the concept of partial coherence. In practical microscopy, however, this progress has hardly been noticed up to now. The present paper tries to explain, in a comprehensible manner, the concept of partial coherence as well as its application to the formation of the image of two object points. A graphical representation developed by the author provides not only a synopsis of the resolution under different conditions but demonstrates, moreover, that the relations between self-luminous and illuminated objects are not inconsiderably different from the conclusions drawn from the 'equivalence principle' of von Laue (1914). An application of annular bright-field illumination and the character of this method are discussed. (11 refs.)

99179 Image contrast in a laser projection microscope. K.I.Zemskov, M.A.Kazaryan, V.M.Matveev, G.G.Petrash (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.183-6 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.336-41 (Feb. 1983).
An experimental investigation was made of the contrast of an amplified image produced by a laser projection microscope. It was found that under typical operation conditions the amplified image contrast differed little from the initial contrast. (8 refs.)

99180 Computer graphics for the intelligent microscope. J.M.S.Prewitt (Div. of Computer Res. & Technol., Nat. Inst. of Health, Bethesda, MD, USA), B.Lander, L.Roelofs.
Proceedings of the Fifteenth Hawaii International Conference on System Sciences 1982, Honolulu, HI, USA, 6-8 Jan. 1982 (HI, USA: Hawaii Int. Conference Syst. Sci. 1982), p.58 vol.2
Summary form only given. The authors are developing color computer graphics software for 'Intelligent Microscopes' on an image processing facility based on a VAX 11/780 host computer and De Anza IP 5000 image processing system. A variety of graphics tools for quantitative image analysis, be it automatic or interactive, have been developed. These include color isopleth and surface representations, and image display manipulation capabilities which can be combined in a variety of useful ways to facilitate both algorithm design and testing and viewing by the human observer. 07.62 DETECTION OF RADIATION (BOLOMETERS, PHOTOELECTRIC CELLS, I.R. AND SUBMILLIMETRE WAVES DETECTION)

99181 Mobile tracking imaging radiometer. J.A.Roth (Instrumentation Directorate, US Army, White Sands Missile Range, NM, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.356, p.90-7 (1983). (Field Measurement and Calibration Using Electro-Optical Equipment: Issues and Requirements, San Diego, CA, USA, 24-25 Aug. 1982).
The Mobile Tracking Imaging Radiometer (MTIR) has been developed at White Sands Missile Range to support future tests of experimental laser systems. The MTIR features a high angular resolution Forward Looking Infrared imaging system (FLIR) capable of simultaneous operation at 3.7-5.5 and 8-12 micrometers. The FLIR, which is mounted behind a long focal-length tracking telescope, utilizes internal calibration sources as well as external targets to obtain radiometric data. Radiometric calibration considerations are discussed and measurement results presented. (3 refs.)

99182 Jitter suppression: a data processing approach. P.E.Barry, M.Klop (Res. & Dev. Center, Grumman Aerospace Corp., Bethpage, NY, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.366, p.2-9 (1983). (Modern Utilization of Infrared Technology VIII, San Diego, CA, USA, 26-27 Aug. 1982).
The problem of suppressing the effects of line-of-sight (LOS) jitter in starting mosaic sensors is approached from the viewpoint of both real time and post-processing of the corrupted focal plane data. Fundamental limits on the joint observability of LOS motion and spatial scene gradients are established as a function of the level of sensor and background characterization information assumed to be available. It is shown that although separability cannot be assured in most cases of interest, the effects of jitter can be estimated and synchronously subtracted from focal plane data. Simulation results are presented which demonstrate signal to noise improvements in excess of a factor of ten. (2 refs.)

99183 Optical technique for increasing fill factor of mosaic arrays. E.F.Cross, W.A.Garber, G.D.Wiemokly, O.L.Gibb, I.J.Spiro (Aerospace Corp., Los Angeles, CA, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.366, p.10-18 (1983). (Modern Utilization of Infrared Technology VIII, San Diego, CA, USA, 26-27 Aug. 1982).
A novel optical technique for improving the performance of focal plane staring arrays by increasing the fill factor ratio is described. The specific mosaics considered are 64×32 and 128×64 Schottky barrier infrared detectors with charge coupled devices (IRCCD) made fron monolithic silicon. The video enhancement is accomplished by means of a refracting silicon faceplate that redirects focused image irradiance from nonsensitive CCD areas to the infrared detector elements. Operational theory and design parameters for this unique faceplace construction are detailed. With the optimum faceplate configuration installed at the IRCCD front surface, a sensitivity increase of at least 200 percent is predicted from the analysis presented. (2 refs.)

99184 Focal plane spatial response and modulation transfer function (MTF) measurements using a computer-aided flying spot scanner. S.R.Hawkins, R.P.Farley, G.Gal, A.K.Gressle, S.B.Grossman, W.G.Opyd (Lockheed Palo Alto Res. Lab., Palo Alto, CA, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.366, p.41-9 (1983). (Modern Utilization of Infrared Technology VIII, San Diego, CA, USA, 26-27 Aug. 1982).
In the measurement and characterization of the performance of infrared and visible focal plane arrays, the determination of the detailed spatial response of individual detectors as well as the entire array can be extremely important in many electro-optic sensor applications such as the detection of targets in the presence of clutter and passive acquisition and tracking. The authors describe a computer-controlled flying spot scanning technique for the measurement of detailed focal plane detector responses as well as detector-to-detector cross talk and spurious responses. The technique uses a computer-controlled flying spot scanner and online data processing. A simple deconvolution is used to remove the known temporal responses of the detector and electronics followed by a two-dimensional decorrelation of the blur spot from the output signal to obtain the focal plane spatial response. As a natural result of this process the individual detector MTFs can be obtained. This technique has been implemented in a low-background focal plane test facility, which is also described. Several examples of actual test data are shown to demonstrate the use of this spot-scanning facility and its utility as a diagnostic tool. (9 refs.)

99185 Wideband heterodyne detection in the far infrared with extrinsic Ge photoconductors. G.Dodel, J.Heppner, E.Holzhauer (Inst. fur Plasmaforschung, Stuttgart, Stuttgart, Germany), E.Gornik.
J. Appl. Phys. (USA), vol.54, no.8, p.4254-9 (Aug. 1983).
The heterodyne performance of Ge photoconductors doped with shallow impurities was investigated using optically pumped far infrared lasers. Two lasers operating on the 67-μm NH_3 Raman line generated difference frequencies from 0-100 MHz. An additional frequency point at 1.155 GHz was produced with two methanol-isotope lasers at 118 μm. For three detectors with different doping levels IF bandwidths of 141, 63, and 8 MHz were measured using local oscillator powers of a few milliwatts. The detector gain and quantum efficiency were calculated from shot noise measurements. For impedance matched operation the calculated noise equivalent power (NEP) values are 2×10^{-18} W Hz^{-1} for the fastest detector and 6.5×10^{-19} W Hz^{-1} for the slowest detector. (18 refs.)

99186 Trial manufacture of fixed point blackbody with large aperture. S.Hattori.
J. Soc. Instrum. & Control Eng. (Japan), vol.22, no.3, p.309-14 (March 1983). In Japanese.
Describes the construction and performance of a recently-developed large-aperture fixed-temperature blackbody using a graphite crucible inside which copper is melted as fixed-temperature metal. A temperature-controlled electric furnace with the core tube using 310S stainless steel is employed to heat the crucible. A silicon monochromatic radiation pyrometer is used to measure the temperature of the thermal radiation emitted from the blackbody. The luminance distribution inside the crucible is within 0.5K in uniformity. This experiment has proved that the large-aperture fixed-temperature blackbody is useful as a means of calibrating radiation pyrometers. (6 refs.) *K.B.*

99187 Measurements on the accuracy of pyranometers. P.-M.Nast (Deutsche Forschungs- und Versuchsanstalt fur Luft- und Raumfahrt eV, Inst. fur Tech. Phys., Stuttgart, Germany).
Sol. Energy (USA), vol.31, no.3, p.279-82 (1983).
The performance of four different types of pyranometers is investigated. Changes in the sensitivities of the instruments caused by nonlinearity, by angular dependence on the direction of insolation and by tilting of the pyranometers are determined. The calibration factors specified by the manufacturer are checked. The results show that errors due to nonlinearity or angular dependence can be roughly predicted for each type of instrument. For accurate measurements with pyranometers, calibration factors should be redetermined by the user and corrections for the angular dependence of the sensitivity should be taken into account. Some types of instruments are unsuited for inclined positions. (6 refs.)

99188 A thermoelectric detector for high radiant flux densities. J.W.Cochrane, H.J.Goldsmid, R.J.Moore (School of Phys., Univ. of New South Wales, Kensington, Australia).
Sol. Energy (USA), vol.31, no.3, p.327-39 (1983).
The measurement of the high radiant flux density from a tracking solar concentrator can present some difficulties, since it is unlikely that the response of a device, that has been calibrated in unconcentrated radiation, can be extrapolated satisfactorily to high intensities. In particular silicon photodiodes become ineffective at high solar concentrations because of heating of the junction and, moreover, they are not broadband devices. The authors have carried out some experiments on a thermoelectric detector, that has a small enough thermal resistance not to become overheated in concentrated solar radiation but which, at the same time, is sensitive enough to give an accurately measurable response in ordinary sunlight. The device consists essentially of a block of silicon with a blackened copper plate attached to one face and a copper heat sink attached to the opposite face. Because of the very high thermal conductivity of silicon, virtually all the radiant energy that is absorbed by the blackened plate is conducted to the heat sink through the block of semiconductor. The resultant temperature difference across the silicon gives rise to a thermoelectric e.m.f., which is relatively large since the Seebeck coefficient is typically in excess of 1 mV K^{-1}. (1 ref.)

99189 Integrated-optics photodetector utilizing the external photoelectric effect in a Schottky barrier. V.A.Karavanskii, V.N.Morozov, L.F.Plavich, Yu.M.Popov, V.L.Smirnov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.259-61 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.449-52 (Feb. 1983).
An investigation was made of the possibility of using the photoelectric effect in a Schottky barrier at a metal-semiconductor interface for detection of waveguide radiation. The dependences of the photocurrent and photo-emf on the power at the entry to such a photodetector were determined for $GaAs_xP_{1-x}$-GaP waveguide structures with barriers formed at gold and silver contacts, and the quantum efficiency was calculated. 07.65 OPTICAL SPECTROSCOPY AND SPECTROMETERS

(inc. photoacoustic spectroscopy)

99190 Digital filter for computationally efficient smoothing of noisy spectra. M.U.A.Bromba, H.Ziegler (Angewandte Phys., Univ. Paderborn, Paderborn, Germany).
Anal. Chem. (USA), vol.55, no.8, p.1299-302 (July 1983).
Savitzky-Golay smoothing filters can be implemented both nonrecursively and recursively. An advantage of the recursive representation is that it saves much computation time in the case of large filter widths. Unfortunately, exact arithmetic is needed to avoid instabilities of the algorithm. Together with the large computer word length required for large filter widths, this is a severe restriction when the algorithm should be programmed in a high level language like FORTRAN. A modification of the second degree Savitzky-Golay smoothing filter is suggested. The new filter also conserves area, first, second, and third moment of a line. Its recursive realization uses less computation time and smaller word lengths and is less sensitive to roundoff errors. Nevertheless, the new filter shows a slightly better signal/noise behavior than the famous Savitzky-Golay filter. (16 refs.)

99191 Stokes/anti-Stokes Raman vibrational temperatures: reference materials, standard lamps, and spectrophotometric calibrations. M.Malyj, J.E.Griffiths (Bell Labs., Murray Hill, NJ, USA).
Appl. Spectrosc. (USA), vol.37, no.4, p.315-33 (July-Aug. 1983).
The problem of measuring equilibrium vibrational temperatures in materials by using Raman spectroscopy has been analyzed theoretically and experimentally. One major problem is the determination of the corrections, due to the Raman instrument response, that must be applied to raw data to obtain the temperature. Normally a 'standard' lamp is used for this purpose but the problems that can arise are legion. Methods for determining spectral response and temperature response function corrections that must be applied to raw Raman data, for ultimately deriving the equilibrium temperatures of various materials, have been developed such that standard lamps are not required. Instead pure vitreous silica and liquid cyclohexane are selected as reference materials of choice for determining the appropriate spectral corrections applicable to the spectrophotometric data. The results were tested against data obtained from other transparent materials, namely CCl_4, $CHCl_3$, CH_3PCl_2 $GeGl_4$, $GeBr_4$, and CS_2. $GeBr_4$ and CS_2 were poor choices because of the proximity of the melting point of the former to room temperature and laser-induced photolysis of the latter. Detailed statistical analyses of the results indicate a marked lowering of systematic errors over those yielded by standard lamp calibrations. Shortcomings of both methods are also discussed, including several lesser known spectral abnormalities arising from the use of a standard lamp. (22 refs.)

99192 Precise determination of frequency shifts by Raman difference spectroscopy using Voigt profile for the Raman band. B.P.Asthana, W.Kiefer (Phys. Inst., Univ. Bayreuth, Bayreuth, Germany).
Appl. Spectrosc. (USA), vol.37, no.4, p.334-40 (July-Aug. 1983).
A convenient method for the precise determination of the frequency shifts from experimentally obtained Raman difference spectra is described. The method is based on the explicit calculation of the difference curve taking Voigt profile for the Raman band. A relationship between Δ/Γ (Δ, frequency separation between two Raman bands, Γ, Raman bandwidth) and d/I_0 (d, peak-to-peak height in the difference spectrum; I_0, Raman band height) is presented in a graphical form as a function of the band shape parameter $\Gamma/\Gamma G_G$ [$\Gamma_G = (\Delta\nu_{1/2})_{slit}$: used slit width determined experimentally by measuring the half-bandwidth of a narrow plasma line]. The experimental determination of $(\Delta\nu_{1/2})_{slit}$, Γ, d, and I_0 then allows direct derivation of Δ/Γ from the graphically presented functions and consequently the actual frequency shift Δ. The value of Δ/Γ can usually be determined with a typical uncertainty of ±0.002 in the small frequency shift limit and ±0.005 for medium and large frequency shifts and these would determine the frequency shift, Δ, with a maximum uncertainty of ± 0.02 cm^{-1}. An example of experimental spectra has been analyzed in order to assess the utility of the present technique. (17 refs.)

99193 Technique for measuring the amount of pressure-induced polarization scrambling by optical windows in high pressure light scattering cells. S.Perry, P.T.Sharko, J.Jonas (Dept. of Chem., Univ. of Illinois, Urbana, IL, USA).
Appl. Spectrosc. (USA), vol.37, no.4, p.340-2 (July-Aug. 1983).
A simple method for estimating the amount of pressure-induced polarization scambling by optical windows in the high pressure Raman scattering cells is proposed. This method is based on the measurement of the depolarization ratio ρ for a polarized band ($\rho=0$) for which a nonzero value of ρ is produced by the leakage of the I_{VV} component due to stress-induced birefringence of the window material. As an illustrative example the measurement of ρ for the polarized $\nu_3(A_1)$ band in liquid tetramethyltin is presented. (7 refs.)

99194 New experiments in femtosecond condensed matter spectroscopy. C.V.Shank, C.Hirlimann (Bell Telephone Labs., Holmdel, NJ, USA).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.373-81 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Recent advances have taken place in optical pulse generation techniques pushing optical pulsewidths down into the femtosecond domain. Optical pulses with a duration as short as 30 femtoseconds have recently been reported. The authors describe these new advances and show how these techniques are giving new insights in the very fast processes in condensed matter physics. (16 refs.)

99195 Total internal reflectance optoacoustic spectroscopy. P.R.Muessig, G.J.Diebold (Dept. of Chem., Brown Univ., Providence, RI, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4251-3 (Aug. 1983).
When radiation undergoes total internal reflection at a solid-gas interface, an exponentially decaying wave, known as the evanescent wave, propagates into the gas. If the incident radiation is amplitude modulated and the gas has an absorption at the wavelength of the radiation, the optoacoustic effect can be produced by absorption of energy from the evanescent wave. Experiments with 10.6 μ radiation internally reflected in an NaCl prism show the amplitude of the optoacoustic signal (in SF_6) to be linearly proportional to the product of the square of the electric field amplitude and the penetration depth of the evanescent wave as given by Fresnel's equations. The amplitude of the optoacoustic signal in a 100-μl detection cell is found to increase linearly with the mole fraction of SF_6 in He over the range from 10^{-5} to 10^{-2}. (9 refs.)

99196 Effect of spatial incoherence of the laser in photon-correlation spectroscopy. P.N.Pusey, J.M.Vaughan, D.V.Willetts (Royal Signals & Radar Establ., Malvern, England).
J. Opt. Soc. Am. (USA), vol.73, no.8, p.1012-17 (Aug. 1983).
The effects of spatial incoherence of the laser output in photon-correlation spectroscopy are examined both theoretically and experimentally. It is shown that, when several transverse cavity modes oscillate simultaneously at different frequencies, the amplitude of fluctuations in the intensity of scattered light can be reduced significantly. For simultaneous operation of TEM_{00} and $TEM_{01}*$ (doughnut) modes the reduction of the zero-time-delay intercept $g^{(2)}(0)-1$ [where $g^{(2)}(\tau)$ is the normalized intensity-correlation function] can amount to a factor of 3. The effects are shown to be particularly marked when high-gain ion lasers are used, and hitherto unexplained apparently random changes of intercept have been found. Possible implications of these observations for speckle applications, holography, and other forms of coherent optical processing are pointed out. (14 refs.)

99197 Analysis of photon correlation spectral decay curves by the *S*-exponential sum method. P.J.Nash, T.A.King (Dept. of Phys., Univ. of Manchester, Manchester, England).
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.7, p.989-1009 (July 1983).
The analysis of decay curves by the fitting of sums of positive exponentials by the *S*-exponential sum method of Cantor and Evans (1970) is considered. The method has significant advantages over previous methods in guaranteeing the uniqueness of the derived set of positive amplitude exponentials, which provide the best weighted least-squares fit to the data, and in not requiring prior estimates of the number or the values of the decay constants. This paper treats the case of analysis of a single exponential with background and varying noise levels. A comparison of the accuracy obtainable using the C-E method and the Marquardt least-squares procedure is made. The application of this analysis to photon correlation spectroscopy is discussed. (19 refs.)

99198 Formation of an absorbing layer of atoms in semiclosed atomizers for atomic absorption spectrometry. Small atomizers. A.Kh.Gil'mutdinov, I.S.Fishman.
J. Appl. Spectrosc. (USA), vol.37, no.4, p.1103-9 (Oct. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.4, p.541-8 (Oct. 1982).
The authors present a sequential treatment of the formation of absorbing atomic layers as a phenomenon of physics. In the results of the analysis, which comprises almost all processes resulting in an absorbing layer with various degrees of precision, the stationary furnaces appear as a particular case. Since in nonstationary furnaces the probe enters into a medium with a rapidly increasing temperature, a preliminary solution to the problem of the motion of the medium per se must be made before the characteristic features of the transfer are considered. (21 refs.)

99199 Evaluation of spectral line profile from relative widths of Fabry-Perot interferograms. M.Platisa (Faculty of Natural & Math. Sci., Dept. of Phys. & Meteorology, Belgrade, Yugoslavia), R.Konjevic, S.Bukvic.
Opt. & Laser Technol. (GB), vol.15, no.4, p.209-13 (Aug. 1983).
A graphical method for deconvolution of spectral line profile scanned by a Fabry-Perot inteferometer from relative widths is described. The relation between the normalized intensity and relative width is derived. All calculations have been carried out assuming that the overall surface defects function can be approximated by Gaussian function and the contribution of broadening due to the scanning aperture is negligible. (9 refs.)

99200 High repetition rate subnanosecond gated photon counting. A.J.Alfano, F.K.Fong, F.E.Lytle (Dept. of Chem., Purdue Univ., West Lafayette, IN, USA).
Rev. Sci. Instrum. (USA), vol.54, no.8, p.967-72 (Aug. 1983).
A gated photon counting instrument which is capable of operation at the full 100-MHz repetition rate of mode-locked ion lasers is described. This instrument provides a high throughput alternative to more complex and costly instrumentation commonly used in time-correlated single photon counting. Applications to the measurement of subnanosecond fluorescence lifetimes at a 96.8 MHz laser repetition rate and to the reduction of matrix quenching effects in fluorometry at a 5-MHz laser rate are presented. (20 refs.)

99201 Fully electronic servocircuitry for wavelength-modulation spectroscopy. R.Stearns, J.Steele, R.Braunstein (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).
Rev. Sci. Instrum. (USA), vol.54, no.8, p.984-8 (Aug. 1983).
Electronic circuits have been developed to replace the mechanical servos and lock-in amplifiers customarily used in a wavelength-modulated derivative spectrometer. The result is a faster response and wider range of gain while maintaining a constant photomultiplier-tube voltage. (19 refs.)

99202 Frustrated total internal reflection spectroscopy of films with absorption gradients. S.D.Stuchebryukov, A.A.Vavkushevskii, V.M.Rudoi (Inst. of Phys. Chem., Acad. of Sci., Moscow, USSR).
Sov. Phys.-Dokl. (USA), vol.27, no.11, p.931-2 (Nov. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.1-3, p.82-4 (Nov. 1982).
One of the main advantages of frustrated total internal reflection spectroscopy (FTR) is the possibility of studying surface layers whose thickness is of the order of the wavelength of the incident radiation. However, the use of the standard methods of FTR permits one to determine only the integrated average properties of such a layer. Attempts to determine the gradient of the absorption in the surface layer of a sample, i.e. the absorption coefficient α as a function of the coordinate z in the direction normal to the interface between the FTR element and the medium being studied, have been undertaken by Hirschfield (1977). In this investigation the FTR-element+sample was considered as a two-layer system. This approximation is valid only when $d_p \ll d$, where d_p is the penetration depth and d is the thickness of the sample. However, in the general case the optical system must be considered as consisting of at least three media. Then to determine $\alpha(z)$ in the sample being studied it is necessary to find the form of the integrals of absorption and solve the resulting integral equations. (4 refs.)

99203 Optical constants of some commercial microwave materials between 90 and 1200 GHz. J.R.Birch (Div. of Electrical Sci., NPL, Teddington, England).
IEE Proc. H (GB), vol.130, no.5, p.327-30 (Aug. 1983).
The optical constants of three commercial microwave materials have been determined between 90 and 1200 GHz at 290K by the techniques of dispersive Fourier-transform spectroscopy. The materials studied were a cast microwave absorber known as Ferroflow, a machinable glass ceramic known as Macor and a substrate material for planar microwave circuitry known as Epsilam-10. The former two of these have been shown to be potentially suitable for use as thermal sources for the absolute calibration of radiometric instrumentation. The glass ceramic has also been shown to have a broad absorption band centred on 9 cm^{-1} that is obscured in the absorption spectrum by its rapid increase to high wave number, but that is clearly seen in the refraction spectrum. (17 refs.)

99204 Scanning pulsed-polarization spectrometer applied to Na_2. A.J.Taylor, K.M.Jones, A.L.Schawlow (Dept. of Phys., Stanford Univ., Stanford, CA, USA).
J. Opt. Soc. Am. (USA), vol.73, no.8, p.994-8 (Aug. 1983).
The authors report on a computer-controlled system for pulsed-polarization-labeling spectroscopy using a Fizeau-wedge wavemeter and a scanned narrow-band probe. Constants for n=3-7 ${}^1\Sigma_g{}^+$ states in Na_2 are presented. (21 refs.)

99205 Computer interface for a diode-array based spectrophotometer. H.L.Pardue, S.D.Hamilton, W.E.Weiser, H.Kirk, I.Laois (Dept. of Chem., Purdue Univ., West Lafayette, IN, USA).
J. Autom. Chem. (GB), vol.5, no.2, p.108-10 (April-June 1983).
This paper describes hardware and software developed to interface the Hewlett-Packard 8450A spectrophotometer to a general-purpose computer. Selected data for the reaction of acetoacetate with glycine are presented to illustrate the utilization of rapid scanning, multiwavelength kinetic data obtained with the system. (5 refs.)

99206 Boolean logic system for infrared spectral retrieval. S.R.Lowry, D.A.Huppler (Nucolet Instrument Corp., Madison, WI, USA).
Anal. Chem. (USA), vol.55, no.8, p.1288-91 (July 1983).
An interactive retrieval system has been developed for infrared spectral data. This system employs Boolean logic operations on sets defined by the presence or absence of this procedure can reduce the original library of 3300 spectra down to a few spectra, which can be displayed and compared to the unknown spectrum. Options have been included for both peak location and intensity variations. The system has been evaluated by using spectra obtained from a capillary GC/IR experiment. (11 refs.)

99207 FTIR photoacoustic mapper. D.J.Gerson (IBM Corp., Armonk, NY, USA).
IBM Tech. Disclosure Bull. (USA), vol.25, no.12, p.6708 (May 1983).
A commercially available Fourier transform infrared (FTIR) spectrometer is modified to permit the recording of FTIR spectra of optically opaque materials using a photoacoustic effect. (no refs.)

99208 Trends in Fourier transform infrared spectroscopy. J.Chalmers (Polymer Div., ICI, Welwyn Garden City, England).
Lab. Pract. (GB), vol.32, no.7, p.29-30 (July 1983).
Discusses the developments and use of the Fourier transform infrared spectroscopy (FTIR). The role of signal averaging in obtaining spectra of very high signal-to-noise ratio within a useful time-scale is discussed. The developments of GC-FTIR systems, diffuse reflectance technique (DRIFT) and photoacoustic spectroscopy (PAS-FTIR) are also dealt with. (19 refs.)

07.68 PHOTOGRAPHY, PHOTOGRAPHIC INSTRUMENTS AND TECHNIQUES

(for light sensitive materials see also 42.70)

99209 Grain growth during rehalogenating bleaching. L.Joly (R&D Labs., Agfa-Gevaert NV, Mortsel, Belgium).
J. Photogr. Sci. (GB), vol.31, no.4, p.143-7 (July-Aug. 1983).
Parameters influencing grain growth during rehalogenation bleaching are identified. An account is given on the influence of the grain size of the AgX formed during rehalogenation bleaching on the scattering properties as a function of the developer used before bleaching. (17 refs.)

99210 Sensitizer centres: formation, properties, function and efficiency. H.E.Spencer, R.E.Atwell, M.Levy (Res. Labs., Eastman Kodak Co., Rochester, NY, USA).
J. Photogr. Sci. (GB), vol.31, no.4, p.158-69 (July-Aug. 1983).
Presents selective review of sensitizer centres formed by sulphur, selenium, reduction, and sulphur-plus-gold sensitization. It covers salient features without attempting to be comprehensive. (70 refs.)

99211 Frequency characteristics and power conditions of the optical part of a sound exciter (cinematography). V.Langer.
Jemna Mech. & Opt. (Czechoslovakia), vol.28, no.7, p.183-6 (July 1983). In Czech.
The author analyses the constructional parameters of the optical part of a sound head and their influence on the frequency characteristics and level of the output signal. In particular, the influence of the quality of the slot image on the frequency characteristics and the effects of the constructional parameters of the optical system of the sound exciter and the uniformity of the illumination of the slot image on the output signal are analysed. (1 ref.) *E.D.*

99212 The MEOSIX colour analyser. J.Indruch.
Jemna Mech. & Opt. (Czechoslovakia), vol.28, no.7, p.191-4 (July 1983). In Czech.
Describes the principle, practical realisation and applications of the MEOSIX colour analyser developed in Czechoslovakia by ZVS-Meopta, Prerov. The MEOSIX analyser solves problems associated with determination of the corrective filtering level and the required exposure and is particularly suitable for amateur photographers. It is in particular recommended for use with the ZVS-Meopta enlarger. It is concluded that the use of the MEOSIX analyser leads to savings of photographic materials, chemicals and electrical energy of at least 40%. (3 refs.) *E.D.*

99213 An optical system of a 16 mm film projector. V.Langer, V.Venzarova.
Jemna Mech. & Opt. (Czechoslovakia), vol.28, no.7, p.195-8 (July 1983). In Czech.
Two types of optical system are compared—one with an incandescent reflector lamp and a lens with the f-number of 1.2, the other employing an aspherical mirror and a halogen lamp and featuring the f-number of 1. The properties and power parameters of both systems are compared. *E.D.*

99214 ICs for automatic camera-focusing systems. E.Matsuyama, H.Nishira (Mitsubishi Electric Corp., Tokyo, Japan).
Mitsubishi Electr. Adv. (Japan), vol.23, p.29-30 (March 1983).
Camera users have recently witnessed something of a revolution in the field of camera automation. Of the many developments involved, the autofocus camera has drawn the strongest interest, with research and development work in this area being carried out by every manufacturer. In cooperation with two leading camera manufacturers, Mitsubishi Electric has developed two ICs designed to perform autofocus functions for use in small cameras. The features of the M518805 S, developed for Minolta Camera Company, which employs an active range-finding system based on GaAs LED technology are described. (no refs.)

99215 Spectral sensitisation in conjunction with supplementary chemical sensitisation. K.V.Chibisov.
Zh. Nauchnoi & Prikl. Fotogr. & Kinematogr. (USSR), vol.28, no.3, p.161-5 (May-June 1983). In Russian.
The author carried a sensitometric investigation of a silver bromide photographic emulsion spectrally sensitised by a dye and additionally by processed solutions of chemical sensitisers of triethanolamine and hydrazine. It is shown that the reducing agents display a more effective influence on the spectrally sensitised emulsion in comparison with a control emulsion. (6 refs.)

99216 Investigation of the interaction of diglycidol ether of methylphosphonic acid with gelatin. L.B.Brainin, V.K.Evseva, S.P.Perevenentseva, V.F.Klyuchevich, N.I.Rizpolozhenskii, V.K.Kruponov, N.V.Kashina.
Zh. Nauchnoi & Prikl. Fotogr. & Kinematogr. (USSR), vol.28, no.3, p.165-9 (May-June 1983). In Russian.
The authors show that diglycidol ether of methylphosphonic acid has a hardening effect on gelatin. It is shown that the modification of gelatin by this preparation is associated with a change in the hypomolecular structure of its macromolecule. A possible mechanism for the interaction with gelatin is discussed. (19 refs.)

99217 Determination of the probability of quantum absorption for particles of photographic blackening. A.V.Balanetskii, O.N.Kozakov, V.I.Grossman.
Zh. Nauchnoi & Prikl. Fotogr. & Kinematogr. (USSR), vol.28, no.3, p.170-3 (May-June 1983). In Russian.
The authors describe a method for evaluating the optical parameter known as K, the probability of quantum absorption by particles of blackening. The method is based on the theory of single-stage scattering and on integral photometry. In the visible region of the spectrum K ranges from 0.4 to 0.7 for emulsion microcrystals in the size range 0.4 to 3.00 μ. (11 refs.)

99218 General method of calculating the electric field pattern of latent charge images. N.A.Fedorova.
Zh. Nauchnoi & Prikl. Fotogr. & Kinematogr. (USSR), vol.28, no.3, p.191-7 (May-June 1983). In Russian.
The author presents an algorithm and program for calculating the electrostatic force lines of an arbitrary latent charge image formed at the surface of an electrophotographic layer in the process of exposure. The force lines of the electric field above an electrophotographic layer of two charged lines situated at various distances from each other are calculated as an example. The character of their electrophoretic development on the basis of the force line pattern is analysed. (9 refs.)

99219 Optical systems of high-speed cameras with opto-mechanical commutation. A.V.Belinskii.
Zh. Nauchnoi & Prikl. Fotogr. & Kinematogr. (USSR), vol.28, no.3, p.198-204 (May-June 1983). In Russian.
Describes the basic forms of optical system of high-speed cameras with opto-mechanical commutation and classifies them. Optical systems which permit a significant improvement in image quality are proposed. Methods of calculating such optical systems are given. (3 refs.)

99220 The influence of a strong electric field on a photographic layer during blocked ionic conduction. A.L.Kartuzhankii, V.M.Ulanov.
Zh. Nauchnoi & Prikl. Fotogr. & Kinematogr. (USSR), vol.28, no.3, p.212-14 (May-June 1983). In Russian.
The authors discuss observation of the sensitivity of an AgBr X-ray film when subjected to 50 ns light pulses and 300 ns electric field pulses. The ratio of sensitivity with the field applied to that without is plotted as a function of the delay between the onset of the optical pulse and the field pulse (10^{-6} to 10^{-2}s), with and without immersion of the film in an acqueous solution (0.005 g.l) of 1-phenyl-5-mercaptotetrazole. (2 refs.)

99221 Relaxation processes in emulsion microcrystals of silver halides with adsorbed dyes. L.N.Duglav, Yu.F.Mitroganov, P.V.Meiklyar.
Zh. Nauchnoi & Prikl. Fotogr. & Kinematogr. (USSR), vol.28, no.3, p.217-18 (May-June 1983). In Russian.
The authors give experimental results on the photo-e.m.f. relaxation time in various spectral regions as a function of the concentration of an adsorbed dye in Ag-halide films. Photo-e.m.f. oscillograms are given for a AgCl layer exposed to 400 and to 540 mm wavelength light pulses. The rise and decay of the oscillogram signal was slower for 540 mm light than for the 400 nm light. (3 refs.)

99222 Change of state of colour centres in alloyed sodium chloride crystals. A.N.Pavlov, V.V.Sedov, I.S.Smirnov.
Zh. Nauchnoi & Prikl. Fotogr. & Kinematogr. (USSR), vol.28, no.3, p.219-21 (May-June 1983). In Russian.
The authors present results on the transformation of a photosensitivity centre to a visible image centre in NaCl crystals sensitised to UV radiation. Two types of NaCl crystal were used—one being alloyed (0.02 weight %) with anhydrous MnCl, the other being alloyed (0.02 weight %) with hydrous MnCl. The transformation process is investigated with the aid of absorption spectra and lattice parameter measurements. (7 refs.)

99223 Influence of the rate of deformation of a photographic emulsion jet during extrusion on the magnitude of maximum elongation emulsification. Yu.A.Bureev.
Zh. Nauchnoi & Prikl. Fotogr. & Kinematogr. (USSR), vol.28, no.3, p.221-3 (May-June 1983). In Russian.
Investigates the dependence of the maximum elongation of an emulsion jet on the speed of the moving substrate and on the mean velocity gradient of displacement in an emulsion jet. It is shown that both dependencies are linear. In practice this means that the higher the deformation rate the thinner is the jet which can be applied to the substrate. (3 refs.)

99224 Retention of photographic images in aluminium hydride layers. S.A.Bernval'd, V.V.Boldyrev, A.L.Kartuzhanskii, Yu.P.Larionov, R.P.Mitrofanova.
Zh. Nauchnoi & Prikl. Fotogr. & Kinematogr. (USSR), vol.28, no.3, p.223-5 (May-June 1983). In Russian.
Discusses the thermal ageing of photographic paper materials based on AlH_3. The influence of temperature and moisture content on image lifetime is investigated. The effect of actinic currents and other factors able to induce decomposition of the remaining undeveloped AlH_3 is also examined. (4 refs.)

99225 Theory of double-jet emulsification (review). A.I.Kharimonova.
Zh. Nauchnoi & Prikl. Fotogr. & Kinematogr. (USSR), vol.28, no.3, p.226-38 (May-June 1983). In Russian.
The basic kinetic equation of emulsification is presented. The rate of nucleation and growth of microcrystals are calculated and the kinetics of double-jet emulsification are discussed. The critical rate of emulsification is determined. Practical applications of the above theory are considered. (32 refs.)

07.75 MASS SPECTROMETERS AND MASS SPECTROMETRY TECHNIQUES

(for mass spectroscopic chemical analysis, see 82.80)

99226 An improved tandem mass spectrometer—ion-cyclotron-resonance spectrometer. P.R.Kemper, M.T.Bowers (Dept. of Chem., Univ. of California, Santa Barbara, CA, USA).
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.52, no.1, p.1-24 (1 Aug. 1983).
An improved design for a tandem mass spectrometer-ion-cyclotron-resonance spectrometer (TICR) is presented. The TICR consists of an ion source, a 180° mass filter, and a separate reaction/detection region, consisting of an ICR cell. Since the ion formation and reaction regions are separate, determinations of kinetics and product distributions are greatly simplified. The design presented includes a velocity filter at the entrance of the ICR cell, to remove translationally hot ions, and the use of a second ICR cell as an ion source. This allows ICR double-resonance techniques to be used in the ion formation region. Data on performance are presented, as well as examples of several novel experiments which are possible. The question of reactant-ion kinetic energy is discussed, and data are presented which indicate that the ions entering the ICR cell have kinetic energies of ~0.5 eV. Examples are presented illustrating the use of ICR double resonance to determine the effects of kinetic energy on reaction rate constants and product distributions. (29 refs.)

99227 Field desorption of hydrocarbon polymers. R.P.Lattimer (BF Goodrich Res. & Dev. Center, Brecksville, OH, USA), H.-R.Schulten.
Int. J. Mass Spectrom. & Ion Phys. (Netherlands), vol.52, no.1, p.105-16 (1 Aug. 1983).
Field desorption mass spectra have been obtained for several low-molecular weight hydrocarbon polymers—polybutadiene, polyisoprene, polyethylene and polystyrene. The principal oligomer ios corresponded to $[M]^+$ in every case, i.e. there was little tendency to for ions via proton attachment. Molecular weight averages ($\bar{M}_n$ and $\bar{M}_w$) derived from FDMS data agree well with values obtained by conventional techniques. (17 refs.)

99228 High-pressure collisional activation mass spectrometry. K.Blom, B.Munson (Dept. of Chem., Univ. of Delaware, Newark, DE, USA).
J. Am. Chem. Soc. (USA), vol.105, no.12, p.3793-9 (15 June 1983).
Ions produced under chemical ionization (CI) conditions can be collisionally activated and dissociated within the high-pressure ion source by the application of relatively large electric fields within the source. A new multiregion ion source that separates regions of CI reaction and high-pressure collisional activation (HPCA) is employed to study these processes. These HPCA spectra may differ significantly from single-collision CID spectra of protonated species. Reactions between fragment ions and the reagent/collision gas are observed that can be used to differentiate the structures of fragment ions. Both parent and fragment ions can be analyzed by high-resolution mass spectrometry under HPCA conditions. Dissociation mechanisms are investigated and analytical applications discussed. (18 refs.)

99229 Magnetic sectoral atom probe for studying the field ionization process. M.S.Glowacki, W.E.Lenkow (Solid State Phys. Dept., Coll. of Education, Czestochowa, Poland).
J. Tech. Phys. (Poland), vol.23, no.2, p.203-12 (1982).
The magnetic sectoral atom probe has been designed and constructed in such a way as to be able to operate with high-purity imaging gas. The vacuum system permits pressure in the residual gases to be attained equal to about 7×10^{-10} hPa under normal working conditions of the device. The mass-spectrum measurement of these gases showed the occurrence of only two active gases: water and carbon monoxide, having partial pressures equal respectively to 1.3×10^{-10} hPa and 2.7×10^{-10} hPa. The other active gases have partial pressures by at least one order lower. Such favourable vacuum conditions, the resolution attained of the field ion microscope, estimated on the basis of the image observations on 3-3.5 Å at the emitter temperature of 78K, as well as sufficiently high sensitivity of the detection system, all these factors permit investigating the field ionization process of the pure imaging gases and their mixtures above the single, selected atoms on the clean tungsten surface. The foregoing measurement results concerning the course of the helium field ionization process above the individual atoms in the (011)-plane of the tungsten surface, in the form of mass spectrum, and dependence of the He^{+1} ion current upon the applied voltage and the electric-field intensity, testify to distinct difference in the course of the field-ionization process, when compared with similar dependences for the total ion current. (36 refs.)

99230 Development of a totally computer-controlledl triple quadrupole mass spectrometer system. C.M.Wong, R.W.Crawford, V.C.Barton, H.R.Brand, K.W.Neufeld, J.E.Bowman (Lawrence Livermore Nat. Lab., Livermore, CA, USA).
Rev. Sci. Instrum. (USA), vol.54, no.8, p.996-1004 (Aug. 1983).
A totally computer-controlled triple quadrupole mass spectrometer (TQMS) is described. It has a number of unique features not available on current commercial instruments, including: complete computer control of source and all ion axial potentials; use of dual computers for data acquisition and data processing; and capability for self-adaptive control of experiments. Furthermore, it has been possible to produce this instrument at a cost significantly below that of commercial instruments. This triple quadrupole mass spectrometer has been constructed using components commercially available from several different manufacturers. The source is a standard Hewlett-Packard 5985 B GC/MS source. The two quadrupole analyzers and the quadrupole CAD region contain Balzers QMA 150 rods with Balzers QMG 511 r.f. controllers for the analyzers and a Balzers QHS-511 controller for the CAD region. The pulsed-positive-ion-negative-ion-chemical ionization (PPINICI) detector is made by Finnigan Corporation. The mechanical and electronics design were developed at LLNL for linking these diverse elements into a functional TQMS as described. The computer design for total control of the system is unique in that two separate LSI-11/23 minicomputers and assorted I/O peripherals and interfaces from several manufacturers are used. The evolution of this design concept from totally computer-controlled instrumentation into future self-adaptive or 'expert' systems for instrumental analysis is described. Operational characteristics of the instrument and initial results from experiments involving the analysis of the high explosive HMX (1,3,5,7-Tetranitro-1,3,5,7-Tetrazacyclooctane) are presented. (15 refs.)

99231 Design and operating characteristics of a retarding field energy analyzer-quadrupole mass filter for measurement of energy distribution of thermal ion. T.Harada, M.Asano, K.Kubo.
Tech. Rep. Inst. At. Energy Kyoto Univ. (Japan), no.193, p.1-15 (Jan. 1983).
A specially designed retarding field energy analyzer was set in front of a quadrupole mass filter to study the energy distribution of thermal ions emitted from a hot metal surface. The ion energy distribution and its derivative are obtained by the technique of electronic differentiation of the retarding voltage curve in which a small sinusoidal modulating voltage is applied to the analyzer in a method similar to the widely used LEED-Auger systems. The effects of the frequency and the amplitude of the modulating voltage on the energy distribution and its derivative have been investigated. The analyzer has been used for the measurements of the energy distributions of Na^+, K^+ and Rb^+ thermal ions emitted from impurities in a tungsten ribbon. It is shown that the values of the retarding voltages at maximum in the energy distribution curve and at zero output in the derivative of the distribution curve correspond to the contact potential difference between the ribbon emitter and the grids in the analyzer. 07.77 PARTICLE BEAM PRODUCTION AND HANDLING; TARGETS

(see also 29.25 in elementary-particle and nuclear physics, 41.80 Particle beams and particle optics)

99232 **Radial isolated Blumlein electron beam generator.** R.J.Adler (Mission Res. Corp., Albuquerque, NM, USA), R.B.Miller, K.R.Prestwich, D.L.Smith.
Rev. Sci. Instrum. (USA), vol.54, no.8, p.940-5 (Aug. 1983).
A new high-voltage pulse-forming line, the radial isolated Blumlein (RIB), is described. The new configuration produces an output voltage pulse into a matched load equal to the charge voltage on the line (as in a conventional Blumlein circuit); however, the prepulse level is negligible and both sides of the load remain at electrostatic ground potential. The RIB is rapidly charged to allow 24 oil dielectric spark channels to close within ~2 ns. With this number of channels, 94% of the theoretical peak voltage is achieved even though the pulse duration is only 15 ns. Using a foilless diode load, the device has been used to generate 4-MeV, 100-kA electron beam pulses. (8 refs.)

99233 **Construction and calibration of a four-beam source for the preparation of rare-gas diluted metal-hydrogen films.** R.Ludwig, H.Micklitz (Inst. fur Experimentalphys. IV, Ruhr-Univ. Bochum, Bochum, Germany).
Rev. Sci. Instrum. (USA), vol.54, no.8, p.1009-11 (Aug. 1983).
The authors present a unit which enables one to evaporate two different metals, rare gas, and atomic or molecular hydrogen at the same time onto a substrate held at a temperature of about 5K. The deposition rates of the metals and the rare gas are measured by a quartz oscillator. The hydrogen deposition rate is calibrated by using the H-concentration dependence of the superconducting transition temperature in Pd-H and Al-H, known from ion-implantation experiments. (9 refs.)

07.80 ELECTRON AND ION MICROSCOPES AND TECHNIQUES

(see also in condensed matter 61.16D Electron microscopy, 61.16F Field ion microscopy)

99234 **Uncertainties in thick-target PIXE analysis.** J.L.Campbell, J.A.Cookson (AERE, Harwell, England), H.Paul.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.427-39 (1 July 1983).
Thick-target PIXE analysis involves uncertainties arising from the calculation of thick-target X-ray production in addition to the usual PIXE uncertainties. The calculation demands knowledge of ionization cross-sections, stopping powers and photon attenuation coefficients. Information on these is reviewed critically and a computational method is used to estimate the uncertainties transmitted from this data base into results of thick-target PIXE analyses with reference to particular specimen types using beams of 2-3 MeV protons. A detailed assessment of the accuracy of thick-target PIXE is presented. (31 refs.)

99235 **The use of mini-lenses in the transmission electron microscope.** J.Podbrdsky (Ustav Pristrojove Techniky CSAV, Brno, Czechoslovakia).
Cesk. Cas. Fyz. Sekce A (Czechoslovakia), vol.33, no.3, p.237-50 (1983). In Czech.
Describes possibilities of the optical system of a 100 kV transmission microscope using mini-lenses with high current density in their excitation coils. The construction and optical advantages of mini-lenses are compared with economical disadvantages; the compromise value of the maximum current density is found. As an example of possible mini-lenses applications an experimental optical system is described, which reaches not only high mechanical stability due to a very short optical column but makes it possible to use some unconventional methods of the transmission electron microscopy. (17 refs.)

99236 **Erection of a device for energy-loss analysis of fast electrons.** B.Kubier, G.Kaiser, H.Boudriot (Bergakad. Freiberg, Freiberg, Germany).
Exp. Tech. Phys. (Germany), vol.31, no.3, p.245-50 (1983). In German.
A commercial electron microscope EF 4 was enlarged so that it is possible to carry out energy loss analysis of fast electrons. The construction and the function of the most important units are described. (no refs.)

99237 **Scanning tunneling microscopy.** G.Binnig, H.Rohrer (IBM Zurich Res. Lab., Ruschlikon, Switzerland).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.481-2 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
Scanning tunneling microscopy is a very young method for studying surfaces of conductors in real space, including adsorbates. The authors present a short account of the main steps in the development of the technique, and briefly mention the most recent results. (7 refs.)

99238 **TEM/STEM requirements: multipurpose or specialized instruments?.** W.M.Stobbs (Dept. of Metall. & Materials Sci., Univ. of Cambridge, Cambridge, England).
J. Microsc. (GB), vol.131, pt.1, p.47-53 (July 1983).
The relative advantages and disadvantages of high resolution and other more general imaging techniques are considered and the potential of a multipurpose, moderate resolution, TEM with EELS is assessed. (50 refs.)

99239 **Instrumental requirements for high resolution imaging.** K.-H.Herrmann (Inst. fur Angewandte Phys., Univ. Tubingen, Tubingen, Germany).
J. Microsc. (GB), vol.131, pt.1, p.67-78 (July 1983).
The resolution of modern transmission electron microscopes reaches the physical limits imposed by lens aberrations and energy width. One of the many conditions to be fulfilled, the alignment of illuminating the imaging beam onto the coma-free objective axis, is particularly discussed where since axial coma cannot be detected by the usual resolution-checking methods. Space consumption of specimen stages prevents the full utilization of the magnetic saturation limit only in the 100 keV range. With higher energies, this handicap is obviated, and some additional advantages can be gained which promote material investigations at atomic resolution, and which are presently utilized in instrumental research projects. High resolution with biological specimens has up to now been unsuccessful because of radiation damage. Optimum utilization of all electrons scattered at the specimen must thus be given priority over optical resolution. Important instrumental requirements are minimum exposure beam control, imaging modes with high collection efficiency, and recording devices with high detection quantum efficiency connected on-line to image processors. A remarkable decrease in beam sensitivity of organic crystals, by more than one order, has been found by cooling the specimen down to 4K which, by the use of superconducting lenses, can be combined with both ultra high vacuum and the stability requirements for high resolution. Yet up to now, such protection has not been achieved with He cryostates in conventional lenses, perhaps because a temperature increase even of only a few K is harmful. (40 refs.)

99240 **X-ray photoelectron diffraction (XPED) measurements by using high performance angle-resolved X-ray photoelectron spectrometer (ARXPS).** M.Owari, Pei-Xun Jien, M.Kudo, Y.Nihei (Inst. of Industrial Sci., Univ. of Tokyo, Tokyo, Japan), H.Kamada.
J. Spectrosc. Soc. Jpn. (Japan), vol.32, no.2, p.103-9 (1983). In Japanese.
The angle-restricting aperture and the precise two-axis-rotation sample manipulator are added-on to the high-performance multichannel X-ray photoelectron spectrometer to set up the high performance angle-resolved X-ray photoelectron spectrometer. Obtained precisions of angular control are within 0.1° along off-plane (θ), and within 1° along on-plane (ϕ) sample rotations. Angular resolutions of the aperture, in terms of the step response, are designed as 4.2° along θ and 6.4° along ϕ. Polar, azimuthal and two-dimensional XPED patterns for As3d and Ga3d photoelectrons from GaAs(001) surface are measured with the instrument. Observed XPED patterns show clear correspondence with crystal structure of GaAs, and the slopes of intensity distributions in XPED patterns indicate that expected angular resolution along ϕ and better resolution along θ are realized on the instrument. (10 refs.)

99241 **Abbreviations for microscopical and analytical methods.** H.Hantsche (Bundesanstalt fur Materialprufung, Berlin, Germany).
Microsc. Acta (Germany), vol.87, no.3, p.271-6 (May 1983). In German, English.
The number of analytical methods relying mainly on physical principles is still increasing and passed the fifty mark. To make confusion complete, identical methods have different abbreviations, because: (i) by translating into other languages first letters often change; (ii) some characterize the method by the excitation process while others take the emitted particle to name the analytical technique; (iii) of historic reasons. The list of abbreviations given was compiled over several years from the literature but is certainly not complete. The author, however, believes it to be useful. (no refs.)

99242 **Novel spectrometer for time-angle resolved ultraviolet photoemission.** Y.Canivez, L.D.Laude, R.Andrew (Univ. de l'Etat, Mons, Belgium).
Rev. Sci. Instrum. (USA), vol.54, no.8, p.989-92 (Aug. 1983).
The authors described a new electron spectrometer for time-angle resolved photoemission. The apparatus consists of 44 electron detectors (microchannel plate) 4 mm in diameter, equally spaced on half a sphere (35-mm internal radius), and acting in the so-called 'spherical retarding potential' method configuration. Resolution in energy is measured to be of the order of 0.3 eV and typical time resolution is 0.1 s. This spectrometer is conceived essentially for time-resolved surface reaction studies. Preliminary results are presented for the Si(111) surface. (11 refs.)

99243 **Numerical calculations of electron trajectories in the 127° analyzer using a position-sensitive detector under conditions of fringing fields.** C.Oshima, R.Franchy, H.Ibach (Inst. fur Grenzflachenforschung & Vakuumphys., KFA Julich, Julich, Germany).
Rev. Sci. Instrum. (USA), vol.54, no.8, p.1042-6 (Aug. 1983).
The theoretical performance of the 127° electron analyzer equipped with a position-sensitive detector has been discussed on the basis of a numerical calculation of electron trajectories. Including the Herzog correction in the calculation allows one to obtain good foci of electron onto almost all regions of position-sensitive detector; it suggests that electron energy loss spectroscopy with high-energy resolution ($\Delta E/E_0=1.6\times10^{-3}$) can be realized by the new analyzer. A nonlinear relation between the arriving point on the detector and electron energy has also been examined for some different fringing fields. (6 refs.)

07.85 X-RAY, GAMMA-RAY INSTRUMENTS AND TECHNIQUES

99244 Size effect of powdered sample on EXAFS amplitude. K.-q.Lu, E.A.Stern (Dept. of Phys., Univ. of Washington, Seattle, WA, USA).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.475-8 (1 July 1983).
Powdered samples are commonly used to measure the extended X-ray absorption fine structure (EXAFS) and near-edge structure. It is shown that sizes of particles typically employed produce significant reduction in the EXAFS amplitude for concentrated samples. The distortion is calculated and found to be in good agreement with measurements on $FeSi_2$ samples. To obtain accurate EXAFS amplitudes on powdered samples it is necessary to use particles significantly smaller than 400 mesh when the atom of interest is concentrated. (6 refs.)

99245 On a certain inverse problem in γ-acoustic spectroscopy. A.R.Arakelyan, R.G.Gabrielyan, A.R.Mkrtchyan, H.A.Aslanyan, Kh.V.Kotandyan (Dept. of Appl. Problems of Phys., Acad. of Sci., Erevan, Armenian SSR).
Phys. Status Solidi b (Germany), vol.118, no.1, p.K69-74 (1 July 1983)
It is shown that the inverse problem of γ-acoustic spectroscopy, i.e. determination of US oscillation parameters depending on the acoustic properties of the medium, can be solved on their basis and the experimental results given. To achieve this aim, experimental points should be approximated by a certain function $\bar{y}=\bar{y}(d,\alpha_1,\alpha_2,\ldots,\alpha_n)$ where α_1, $\alpha_2\ldots,\alpha_n$ are the parameters to be determined. Determination of US parameters is then reduced to the choice of $\alpha_1,\alpha_2,\ldots,\alpha_n$ so that the experimental points $y_k=I(US)/I(o)d|d_k$ should best coincide with $\bar{y}$. (5 refs.)

99246 X-ray diamond-anvil press for use at high temperatures. T.Kikegawa, H.Iwasaki (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan).
Rev. Sci. Instrum. (USA), vol.54, no.8, p.1023-5 (Aug. 1983).
This paper describes the design and operation of a new diamond-anvil press than can conduct X-ray diffraction investigations of polycrystalline materials at sustained pressure and temperature up to 30 GPa and 500°C. Several improvements have been made in heating efficiency, uniformity of temperature, alignment operation of anvil faces, and elimination of preferred orientation effect. Examples of the application to the study of a high-pressure phase of phosphorus are shown. (16 refs.)

99247 A detailed evaluation of counting losses of detectors in wavelength-dispersion X-ray spectroscopy. P.Banerjee (Siemens AG, Karlsruhe, W Germany).
X-ray Spectrom. (GB), vol.12, no.3, p.97-105 (July 1983).
The exponential equation $R_0=R.e^{R0\tau}$ describes the counting losses in wavelength-dispersive X-ray spectroscopic (WDF) detectors up to very high counting rates. The correction error can be considerably lower than 1% for a true counting rate of 7×10^5 s^{-1}. The dead time constant τ has, however, to be determined very accurately for this. Methods of determining τ with the desired accuracy are also described. A formula for correcting for dead time losses for two detectors in series, where each detector has a different dead time, is deduced and verified by experiment. Here again, one can calculate the true counting rate with an accuracy of 1% at a true counting rate of about 7×10^5 s^{-1}. (3 refs.)

07.90 OTHER TOPICS IN SPECIALISED INSTRUMENTATION

99248 Thermoluminescence dating of Chinese pottery. W.Wang (Shanghai Museum, Shanghai, China), Z.Zhou.
Archaeometry (GB), vol.25, pt.2, p.99-106 (Aug. 1983).
A new technique is employed in which thermoluminescence dosimetry is used for the alpha component of the annual dose as well as for the beta and gamma components; also, the need for external calibration of radioisotope sources is eliminated. Dates are reported for samples from seven sites, associated radiocarbon results being given for five of them. (16 refs.)

99249 Forensic utiization of neutron radiography. F.M.Kerr (Royal Canadian Mounted Police, Ottawa, Ontario, Canada).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.591-8
X and gamma radiography are well established aids to forensic science. Neutron radiography is less common for many reasons. The paper outlines some of the attempts made by the Royal Canadian Mounted Police to explore the potentialities of this powerful tool. It will deal with both isotopic ^{252}Cf and beam-tube swimming-pool reactor neutron sources. It outlines some of the problems encountered in the forensic area and suggests some solutions. (no refs.)

99250 Neutron image intensifier tubes. M.Verat, H.Rougeot, B.Driard.
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.601-7
The most frequently used techniques in neutron radiography employ a neutron converter consisting of either a scintillator or a thin metal sheet. The radiation created by the neutrons exposes a photographic film that is in contact with the converter: in the direct method, the film is exposed during the time that the object is irradiated with neutrons; in the transfer method, the film is exposed after the irradiation of the object with neutrons. In industrial non-destructive testing, when many identical objects have to be checked, these techniques have several disadvantages. Non-destructive testing systems without these disadvantages can be constructed with neutron-image intensifier tubes (NII). The authors present a description and operating characteristics of a neutron-image intensifier tube. They compare a system incorporating an NII with a system without an NII. The neutron image intensifier tube makes possible the use of compact, flexible, low-power neutron generators such as small accelerators or californium-252 bombs. Real-time industrial testing using TV pickup should be possible without the need for a nuclear reactor. (no refs.)

99251 Fluorescent converter and neutron absorber being made of boron nitride. G.Matsumoto, M.Teramura, J.Sato, M.Maeda (Nagoya Univ., Nagoya, Japan).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.609-15
The improvement of the sensitivity of the fluorescent convertor is essential to the neutron radiography (NRG) which utilizes portable, not so strong neutron sources. The fluorescent convertor made of boron nitride (BN) is fabricated and tested. The sensitivity is about 1/20 of the NE426. If ^{10}BN is utilized, the sensitivity will be five times as much as that of natural BN. Using the neutron beam of the Kyoto University Research Reactor, the flux of which is about 10^6 n/cm^2 sec, a good neutron television image is obtained. As a bi-product of this convertor, a flexible absorber is fabricated. (no refs.)

99252 MTF analysis of the near-real time neutron radiography facility at MURR. J.T.Lindsay, D.M.Alger, S.R.Bull, W.H.Miller.
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.617-23
With the advent of different real-time neutron radiography systems comes the necessity to develop a means to quantitatively evaluate and compare these systems. A method suitable for measuring the resolution capabilities of the image-forming system is the determination of the modulation transfer function (MTF). The MTF is a measure of an imaging system's ability to reproduce the spatial frequencies present in an image. The authors present results for several neutron scintillation screens used in neutron radiography. A plot of the MTF versus spatial frequency is presented for the two commercial screens and a few of the absorber/phosphor mixtures developed at MURR. Of the various absorbers studied, gadolinium is seen to provide the least resolution at higher frequencies with a corresponding loss in speed. The lower resolution α-emitters (B and Li) however do result in a much greater light output and for certain low resolution studies provide a means of getting an image at a considerably lower neutron flux. (14 refs.)

99253 Neutron radiographic image definition under a wide range of resolution conditions. W.L.Whittemore, G.Schlueter, J.Shoptaugh (General Atomic Co., San Diego, CA, USA).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.885-90
When neutron radiography is intended to create suitable images of very small objects, large values of length/diameter (L/D) and, where possible, a reduction in the thickness of the object are usually sought. Typically, details having dimensions of only a few thousands of an inch can be resolved in objects that are 1 and 2 in. thick. The maximum image contrast occurs when an umbra and a penumbra form the shadow cast by the small detail. When the object thickness is much thicker or the fine detail is even smaller, the image of the detail consists only of penumbra shadows and has greatly reduced contrast. Successful neutron radiography has been conducted with very thick objects (~10 in.) in which small defects (~0.020 in.) must be imaged far from the film plane. Conventional imaging requirements suggest uneconomically large values for L/D. Analytical predictions and experimental results verify that images can be useful even if formed only by penumbra shadows. The authors present analytical results that relate image contrast to useful parameters such as thickness to the object, L/D, opaqueness and size of the fine details or defects, and multiple scattering of neutrons in the host material. (2 refs.)

99254 Inverse contrast in neutron radiography. J.Olsen, P.Gade-Nielsen (Riso Nat. Lab., Roskilde, Denmark).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.891-5
Due to the geometrical unsharpness it is possible to have inverse contrast on neutron radiographs. By changing the unsharpness, e.g. by altering the distance of the object to the film, it is possible to have a white area becoming a black area, and conversely. First, this will be shown theoretically when one has an object whose transmittance varies harmonically. Secondly it will be shown how the inverse contrast effect can be demonstrated by having a film at varying distances behind a multislit collimating system. (5 refs.)

99255 The neutron computer tomography. G.Matsumoto, S.Krata (Nagoya Univ., Nagoya, Japan).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.899-906
The method of computer tomography (CT) was applied for neutron insteady of X-ray. The neutron radiography (NRG) image of samples was scanned by microphotometer to get the transmission data. This process was so time-consuming that one could not increase the number of incident angles to samples. The transmission data was processed by FACOM computer and CT image was gained. (no refs.)

99256 The role of diffused beta radiation in imaging with beta emitting neutron radiographic converter screens. J.Rant, G.Pregl, P.Leskovar, F.Zitnik ('J. Stefan' Inst., Univ. Ljubljana, Ljubljana, Yugoslavia).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.907-17
The beta-rays back diffused from cassette backing material contribute significantly to the neutron radiographic image of beta emitting screens used in transfer neutron radiography. The photographic density intensifying factors were assessed as a function of backing material, energy of beta radiation, screen type and thickness, radiographic film parameters and irradiation film exposure geometry. The influence of backing material on the edge spread function in imaging with In converters was studied. (22 refs.)

99257 Scattering point spread functions in neutron radiograph. Y.Segal, A.Gutman, A.Notea (Dept. of Nuclear Engng., Technion-Israel Inst. of Technol., Haifa, Israel).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.929-36
The contribution of the neutron scattering in the radiographed object to the point spread function was calculated using the MORSE-CG Monte Carlo Code. The calculations were performed for a wide range of materials, thicknesses and object to film distances, covering neutron radiography geometries of practical interest. The Monte Carlo results were compared to analytical cal-

culations based on a single scattering model. Least square fitting methods were used to calculate correction functions to the analytical results by adopting them to the more precise Monte Carlo values. In this way continuous analytical functions were obtained which enable easy interpolation within the range of Σ_a, Σ_s, thickness and object to film distance covered by the Monte Carlo calculations. (8 refs.)

99258 Neutron image simulation by Monte Carlo methods. M.P.Butler, A.A.Harms (McMaster Univ., Hamilton, Ontario, Canada).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.937-43
A computationally tractable Monte Carlo simulation method for the study of image unsharpness in neutron radiography is formulated. Its underlying principles are described and tests of its reliability are illustrated. This method appears to be useful in describing selected physical processes uniquely associated with neutron radiography. (6 refs.)

99259 Digital neutron radiography using plane converters with multiwire proportional chambers. S.N.Kaplan, B.A.Director, V.Perez-Mendez, K.H.Valentine (Univ. of California, Berkeley, CA, USA).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.961-9
The authors have developed and studied a moderately low cost, moderate resolution, high sensitivity, on-line method for digital neutron radiography, intended for use where neutron fluence is limited by source strength, or received dose. The basic imaging system consists of a position-sensitive gas proportional chamber together with its associated imaging electronics, and a plane neutron converter. Enriched-boron, gadolinium, and polyethylene (for fast neutrons) converters were analyzed and tested. Some work was done on digital data enhancement, and efforts to improve spatial resolution included pressurizing the proportional-chamber gas to reduce the track lengths of the neutron-interaction products. The results are presented. (4 refs.)

10.00 THE PHYSICS OF ELEMENTARY PARTICLES AND FIELDS

(for cosmic rays, see 94.40; for high energy-experimental techniques and instrumentation, see 29.)

11.00 GENERAL THEORY OF FIELDS AND PARTICLES

(see also 03.65 Quantum mechanics, 03.70 Theory of quantized fields, 03.80 General theory of scattering)

11.10 FIELD THEORY

99260 Remarks on the Krolikowski-Rzewuski equation for a distinguished component of a state vector and asymptotic properties of its solutions. K.Urbanowski (Dept. of Theoretical Phys., Higher Pedagogical School, Zielona Gora, Poland).
Acta Phys. Pol. B (Poland), vol.B14, no.7, p.485-97 (July 1983).
Generalizes the Krolikowski-Rzewuski equation (1956, 1975) for a distinguished component of the state vector and give the new formulae for a quasipotential and inhomogeneity occurring there. The author also studies the strong limit (when time goes to infinity) of the quantum evolution operator occurring in this equation. A connection of this limit with the ergodic theorem on the time average is proved. (17 refs.)

99261 Thermodynamics and two-dimensional lattice gauge models. J.Jurkiewicz (Inst. of Phys., Jagellonian Univ., Cracow, Poland), K.Zalewski.
Acta Phys. Pol. B (Poland), vol.B14, no.7, p.517-32 (July 1983).
The gauge theory with the gauge group $U(N\rightarrow\infty)$ is solved on a two-dimensional lattice. The single plaquette action used depends on L parameters, where L is an arbitrary integer, and thus results for a wide class of variant actions may be compared. A rich structure of second order and third order phase transitions appears. Besides the exact analytic solution a thermodynamical discussion clarifying the qualitative features of the results is given. (13 refs.)

99262 A conventional interpretation of Kahler equation. W.Krolikowski (Inst. of Theoretical Phys., Warsaw Univ., Warsaw, Poland).
Acta Phys. Pol. B (Poland), vol.B14, no.7, p.533-7 (July 1983).
The Kahler equation (1960) for differential forms is interpreted in flat space-time as describing a system of two Dirac particles, one of which being infinitely heavy. (6 refs.)

99263 The finite-temperature phase transition at infinite N. H.Neuberger (Inst. for Advanced Study, Princeton, NJ, USA).
Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands), vol.B220(FS8), no.3, p.237-45 (25 July 1983).
The finite-temperature breakdown of the global $Z(N)$ symmetry of 3+1 dimensional lattice gauge theories is studied within the framework of a reduced, quenched, large-N model using both analytical and numerical methods. (25 refs.)

99264 On the nature of the phase transition in a class of lattice gauge theories. L.Caneschi (Dept. of Phys., Univ. of Pisa, Pisa, Italy), I.Fox, S.Solomon.
Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands), vol.B220(FS8), no.3, p.246-52 (25 July 1983).
The authors investigate the connection between the phase transition recently found by Anthony (1982) in a variant of SU(2) lattice gauge theory and various mechanisms known to produce phase transitions in lattice gauge theories. (9 refs.)

99265 Gauge theories on a simplicial lattice. J.M.Drouffe, K.J.M.Moriarty (CERN, Geneva, Switzerland).
Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands), vol.B220(FS8), no.3, p.253-68 (25 July 1983).
The authors present various results obtained for pure gauge theories built on a simplicial lattice, an alternative to the almost always used hypercubical lattice. The main interest is to lead to shorter calculations, with more rapid thermalization of the Monte Carlo simulations. Their results are quite similar to those obtained with hypercubical lattices. (13 refs.)

99266 A quenching scenario for lattice gauge theories. Zhang Yi-cheng (Istituto di Fisica 'G. Marconi', Univ. di Roma, Roma, Italy).
Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands), vol.B220(FS8), no.3, p.302-16 (25 July 1983).
The author studies lattice gauge theories with complex, random and quenched couplings. Such theories are argued to have the same continuum limits as the annealed case. The first-order phase transitions are shown to be absent and the smoother cross-over behavior of the quenched theory leads to the universal scaling law. (28 refs.)

99267 Vacuum decay by inverse scattering. R.J.Cant (Dept. of Theoretical Phys., Univ. of Manchester, Manchester, England).
Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands), vol.B220(FS8), no.3, p.317-26 (25 July 1983).
Discusses the decay of false vacua which originate from quantum mechanical effects. In particular the author examines the $1/N$ expansion of the $O(N)$ $\lambda\phi^4$ model. This model has an effective potential which is complex for large values of the field. In a previous paper (1979) it is shown that this effective potential could not be used to calculate the decay rate directly. In the present work he shows that the vacuum can decay via poles in the effective action which are evident when it is written in terms of scattering variables. (18 refs.)

99268 Four dimensional theories with composite gauge fields and their supersymmetric generalizations. B.Milewski (Inst. of Theoretical Phys., Univ. of Wroclaw, Wroclaw, Poland).
Fortschr. Phys. (Germany), vol.31, no.6, p.313-38 (1983).
A fourlinear $CP(N\text{-}1)$ model which is classically equivalent to (massive) electrodynamics with a composite four-potential is shown to be renormalizable in 4 dimensions in the framework of the $1/N$ expansion. Also a supersymmetric fourlinear $CG(N, n)$ model is constructed and shown to be equivalent to the super-Yang-Mills model with composite gauge fields. A short introduction to sigma models and supersymmetric gauge theories is given. (47 refs.)

99269 Functional methods. M.H.Zaidi (Dept. de Fisica, Centro de Investigacion y de Estudios, Mexico City, Mexico).
Fortschr. Phys. (Germany), vol.31, no.7, p.403-18 (1983).
The author describes briefly the basic properties of functional differentiation and integration, including an elementary derivation of the rules of integration over anticommuting variables first introduced by Berezin. The methods are applied to examples drawn from quantum field theory. (14 refs.)

99270 The soliton solutions of the $(1+1)$-dimensional real ϕ^4 field at finite temperature. Ru-keng Su (Phys. Dept., Fudan Univ., Shanghai, China), Pin-zhen Bi, Guang-jiong Ni.
J. Phys. A (GB), vol.16, no.11, p.2445-55 (1 Aug. 1983).
Proposes a method based on the concepts of coherent state and the approach of the real time Green function to investigate the spontaneous breaking of symmetry in a $(1+1)$-dimensional ϕ^4 field as well as its restoration at finite temperatures. A critical temperature T_c is found at which the kink-like soliton disappears. In the weak coupling limit, the soliton mass $E_s|_{T=T_c}=(1/3\sqrt{3})E_s|_{T=0}$ and the critical temperature $T_c=(2/3\sqrt{3})E_s|_{T=0}$. (14 refs.)

99271 Towards non-trivial scalar theories in $d\geq4$ space-time dimensions. R.J.Rivers (Blackett Lab., Imperial Coll. of Sci. & Technol., London, England).
J. Phys. A (GB), vol.16, no.11, p.2521-40 (1 Aug. 1983).
Shows, in the large-N limit, how non-canonical quantisation of an $O(N)$-invariant (pseudo) free scalar theory in $d\geq4$ dimensions can give non-trivial behaviour. Implications for recent results on the triviality of canonical scalar theories in $d\geq4$ dimensions are discussed. (18 refs.)

99272 Topology and renormalisability. II. R.Banach (Dept. of Theoretical Phys., Manchester Univ., Manchester, England).
J. Phys. A (GB), vol.16, no.11, p.2541-70 (1 Aug. 1983).
For pt.I see ibid., vol.13, p.L365 (1980). The connection between space-times related by a covering projection and the renormalisability of quantum field theories defined on them is re-examined in the framework of constructive field theory. It is shown that a previous derivation is the heuristic version of a conditioning argument and the possibility of applying such an argument to infinite fundamental group situations (in the specific guise of finite-temperature field theory) and to boundary-value problems is explored. It is found that the implications of conditioning are broadly (though not in every detail) in agreement with known facts from renormalised perturbation theory. (29 refs.)

99273 Intrinsic geometry of the $N=1$ supersymmetric Yang-Mills theory. E.A.Ivanov (Lab. of Theoretical Phys., Joint Inst. for Nuclear Res., Dubna, USSR).
J. Phys. A (GB), vol.16, no.11, p.2571-86 (1 Aug. 1983).
The $N=1$ supersymmetric Yang-Mills theory is formulated analogously to the minimal $N=1$ supergravity in the Ogievetsky-Sokatchev approach (1980). The intrinsic superspace geometry of the $N=1$ Yang-Mills is shown to be the complex geometry of embedding of the real superspace $\mathbf{R}^{4|4}=\{x^m, \theta^{\mu}, \theta^{\mu}=(\theta^{\mu})^{+}\}$ into the extended complex one $\mathbf{C}^{4+M|2}=\{x_L{}^m, \theta_L{}^{\mu}=\theta^{\mu}, \phi_L{}^i\}$, $(i=1, \ldots, M)$, $\phi_L{}^i$ being local coordinates on the group G^c, the complexification of gauge group G, and $M=\dim G$. The $N=1$ Yang-Mills prepotential is identified with $\mathrm{Im}\phi_L{}^i$ restricted to the hypersurface $\mathbf{R}^4/^4$. It takes values in the coset G^c/G, so the $N=1$ Yang-Mills theory can be interpreted as a generalised nonlinear σ model. The corresponding Cartan forms are defined and they are applied to the construction of relevant geometric objects. Some new possibilities following from the suggested formulation of the theory are also discussed. (34 refs.)

99274 Acausality of all standard relativistic wave equations with Harish-Chandra degree four. G.Labonte (Dept. of Phys., Princeton Univ., Princeton, NJ, USA).
J. Phys. A (GB), vol.16, no.12, p.L427-9 (21 Aug. 1983).
The long-standing conjecture of non-existence of acceptable standard relativistic wave equations for particles of spins $s\geq{}^3/_2$ is proven, for all cases with Harish-Chandra degree four. This is an important step toward the general proof since the only remaining candidate equations have higher HC degrees and therefore are expected to exhibit still worse pathologies. (12 refs.)

99275 Correlation equalities and coupling constant bounds implying area decay of Wilson loop for Z_2 lattice gauge theories. F.C.Sa Barreto, M.L.O'Carroll (Dept. de Fisica, Univ. Federal de Minas Gerais, Belo Horizonte, Brazil).
J. Phys. A (GB), vol.16, no.12, p.L431-4 (21 Aug. 1983).
The authors obtain correlation equalities for Z_2 lattice gauge theories and apply them to obtain area decay of the Wilson loop observable in a range of the coupling parameter larger than that obtained from mean field theory considerations. (6 refs.)

99276 Solitary wave solutions in double sinh-Gordon system. K.Babu Joseph, B.V.Baby (Dept. of Phys., Univ. of Cochin, Cochin, India).
J. Phys. A (GB), vol.16, no.12, p.2685-91 (21 Aug. 1983).
Two new classes of solitary wave solutions for the recently suggested double sinh-Gordon system have been obtained. These solutions possess nice stability and asymptotic properties and are characterised by zero topological charge. The existence and behaviour of these solutions in more than two space-time dimensions and the properties of multisolitary waves have been studied in detail. (15 refs.)

99277 Some local covariant representations of the canonical anticommutation relations. Z.J.Hermaszewski, R.F.Streater (Dept. of Math., Bedford Coll., London, England).
J. Phys. A (GB), vol.16, no.12, p.2801-10 (21 Aug. 1983).
The authors find some non-Fock representations of the canonical anticommutation relations in $1+1$ dimensions. These representations, obtained by a Bogoliubov transformation of the Fock annihilation and creation operators, are Poincare covariant, have positive energy, and are labelled by two conserved charges which take on continuous values in the interval $[0,2\pi)$. (12 refs.)

99278 Calculation of ladder diagrams in arbitrary order. V.V.Belokurov, N.I.Ussyukina (Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR).
J. Phys. A (GB), vol.16, no.12, p.2811-16 (21 Aug. 1983).
A scalar ladder propagator-type diagram is rigorously calculated in an arbitrary order of perturbation theory. (10 refs.)

99279 A two-parameter matrix Riccati equation pair for a class of nonlinear sigma models based on a symmetric space. M.A.Snyder (Dept. of Phys. Wellesley Coll., Wellesley, MA, USA).
J. Math. Phys. (USA), vol.24, no.8, p.2204-7 (Aug. 1983).
It is shown that the infinite action of a group on one of its associated symmetric spaces is, in the case of a classical off-diagonal symmetric space, in the form of a matrix Riccati equation. A two-parameter Riccati equation is then found for the nonlinear sigma model based on a symmetric space G/H. (19 refs.)

99280 On the solutions of the Dirac equation. P.Achuthan, S.Benjamin (Dept. of Math., Indian Inst. of Technol., Madras, India).
J. Math. & Phys. Sci. (India), vol.17, no.2, p.193-200 (April 1983). (Proceedings of the Conference on Mathematical Analysis and Applications, Madras, India, 12-13 Nov. 1982).
Dirac's relativistic wave equation, ever since its inception over half a century ago, has been the focus of attention from several points of view. In spite of its unifying feature and extraordinary elegance only very few quantum systems are known for which the Dirac equation is exactly soluble. The Dirac equation for the case of an electron in the presence of the inhomogeneous electric field $E_z(z)=E/(1-az)^2$ is solved exactly. The scattering solution only is possible for this situation. The relevant scattering parameters, viz. the reflection and transmission coefficients, are obtained in the four-component formalism. (11 refs.)

99281 Abelian dominance in a space-time lattice. V.M.Emel'yanov (Moscow Engng. Phys. Inst., Moscow, USSR).
JETP Lett. (USA), vol.37, no.3, p.201-3 (5 Feb. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.3, p.166-8 (5 Feb. 1983).
Orbits constructed from a Cartan subgroup of a gauge group are extreme in a space-time lattice. The relationship with the singular gauge in quantum chromodynamics is discussed. (4 refs.)

99282 Numerical studies of Wilson loops in SU(6) gauge theory in four dimensions. D.Barkai (Center for Appl. Vector Technol., Colorado State Univ., Fort Collins, CO, USA), M.Creutz, K.J.M.Moriarty.
J. Phys. G (GB), vol.9, no.8, p.L149-52 (Aug. 1983).
A previous Monte-Carlo study of pure SU(6) gauge theory in four space-time dimensions is extended to measure all Wilson loops up to size 3×3 on a 6^4 lattice. The string tension is extracted from the Wilson loops and a lower bound is placed on the asymptotic-freedom scale parameter Λ_0. (7 refs.)

99283 Particle production by accelerated charges moving in condensed matter. M.Pardy (Dept. of Theoretical Phys., Brno, Czechoslovakia).
J. Phys. G (GB), vol.9, no.8, p.853-9 (Aug. 1983).
The rates of electron-positron pair creation and rho-meson creation by charges moving in a uniform circular motion in condensed matter are calculated in the framework of the Schwinger source theory. (10 refs.)

99284 An alternative study of the propagation of the Rarita-Schwinger wave equation in the presence of an external electromagnetic field. C.G.Koutroulos (Dept. of Theoretical Phys., Univ. of St. Andrews, St. Andrews, Scotland).
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.13, p.459-61 (30 July 1983).
The authors study the problem of propagation of the solutions of the Rarita-Schwinger wave equation (1941) for spin $^3/_2$ in the presence of an external electromagnetic field, using the method of characteristics used by Velo and Zwanziger (1969), but making use of the criterion of hyperbolicity for first-order quasi-linear systems of partial differential equations given by Jeffrey (1976). (3 refs.)

99285 On the Shamaly-Capri wave equation for spin-1 particles. C.G.Koutroulos (Dept. of Theoretical Phys., Univ. of St. Andrews, St. Andrews, Scotland).
Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.13, p.462-4 (30 July 1983).
The equivalence of the Shamaly-Capri wave equation (1973) to the Gel'fand-Yaglom wave equation (1963) for spin 1 is verified and is shown that there are difficulties with the charge which reflect on its causal propagation. (3 refs.)

99286 Renormalization of the self-consistent summation of exchange diagrams in a relativistic quantum field theory. A.F.Bielajew (Dept. of Phys., Stanford Univ., Stanford, CA, USA).
Nucl. Phys. A (Netherlands), vol.A404, no.3, p.428-42 (15 Aug. 1983).
The self-consistent summation of exchange diagrams is renormalized in a relativistic fermion-scalar field theory using spectral function methods. This is a non-perturbative approach in which all uncrossed exchange diagrams are summoned to all orders in the coupling constant. A detailed exposition of the renormalization technique is presented along with numerical results. Anomalous analytic structure (ghost poles and ghost branch cuts) that arises naturally from the approximation is briefly discussed. The author discusses the generalization to a finite density of fermions that may have application in nucleon-meson field theories which are currently in vogue. (24 refs.)

99287 Remarks on the gauge-invariant formulation for interaction of radiation with matter. D.Lee, A.C.Albrecht (Dept. of Chem., Cornell Univ., Ithaca, NY, USA), Kuo-Ho Yang, D.H.Kobe.
Phys. Lett. A (Netherlands), vol.96A, no.8, p.393-6 (25 July 1983).
It is pointed out the Yang's gauge-invariant formulation does not prefer any particular gauge, contrary to some recent criticism. In this formulation, any gauge is equally acceptable and gives an identical description of the interaction between radiation and matter. The recent attempt by Feuchtwang et al. (1982) to achieve gauge invariance of probability amplitudes is in fact related to older work shown to suffer from path ambiguity in a line integral. (13 refs.)

99288 General solution of the spherically symmetric Yang-Mills equations. B.S.Berman (Inst. for Problems in Mech., Acad. of Sci., Moscow, USSR).
Phys. Lett. A (Netherlands), vol.96A, no.9, p.451-2 (1 Aug. 1983).
A general solution of the spherically symmetric Yang-Mills equations is presented. (5 refs.)

99289 Relativistic quarkonium model based on instantaneous ladder BS equation. II. Mass levels of charmonium and bottonium. M.Hirano (Hokkaido Univ. of Education, Sapporo, Japan), K.Iwata, K.Kato, T.Murota, D.Tsuruda.
Prog. Theor. Phys. (Japan), vol.69, no.5, p.1498-504 (May 1983).
For pt.I see ibid., vol.67, p.1251 (1982). The mass levels of the charmonium and the bottonium are calculated based on the instantaneous ladder BS equation. The agreement with experiment is fairly good. The authors get smaller α_s than nonrelativistic analyses. $\Gamma_{ms}$is estimated to be 80~130 MeV. The relativistic effects are not so small in the charmonium. (9 refs.)

99290 Axially symmetric gauge fields of magnetic monopoles. R.P.Mondaini, N.O.Santos (Inst. de Fisica, Univ. Federal do Rio de Janeiro, Rio de Janeiro, Brazil).
Prog. Theor. Phys. (Japan), vol.69, no.5, p.1548-53 (May 1983).
A Weyl solution is presented for axially symmetric gauge fields of magnetic monopole sources. The authors give a motivation and a scheme of research for working in the solutions of coupled Einstein-Yang-Mills systems. (17 refs.)

99291 Stochastic quantization of nonAbelian gauge field—unitarity problem and Faddeev-Popov ghost effects. M.Namiki, I.Ohba, K.Okano, Y.Yamanaka (Dept. of Phys., Waseda Univ., Tokyo, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.5, p.1580-99 (May 1983).
The stochastic quantization method is applied to the nonAbelian gauge field up to the second order perturbation. It is shown that the stochastic quantization method automatically produces the same correct results as given by the well-known Faddeev-Popov trick but never requires to introduce artificially any ghost field. The gauge fixing problem in this method is also examined in detail. Finally preliminary discussions are given as to whether the physical state condition is automatically satisfied. (4 refs.)

99292 Four-dimensional Ashkin-Teller gauge theory. F.C.Alcaraz, L.Jacobs (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA).
Phys. Rev. Lett. (USA), vol.51, no.7, p.530-3 (15 Aug. 1983).
The authors construct and analyze a lattice field theory of two Z_2 gauge fields which interact in a minimal gauge-invariant fashion. Although the theory presented here, a generalization of the two-dimensional Ashkin-Teller spin system, has no formal continuum limit, it is found that it has an electrodynamicslike phase similar to that observed in general Z_N theories for $N\geq4$. This model is probably the simplest generalization of the conventional Z_2 pure gauge theory which has a massless phase separated from the strong- and weak-coupling regions by lines of second-order phase transitions. (14 refs.)

99293 Faddeev-Popov zeros and confinement of color in a hyperspherical gauge model. R.E.Cutkosky (Dept. of Phys., Carnegie-Mellon Univ., Pittsburgh, PA, USA).
Phys. Rev. Lett. (USA), vol.51, no.7, p.538-41 (15 Aug. 1983).
A new rotationally invariant Hamiltonian method, formulated on a four-dimensional hyperspherical surface, is proposed for the numerical study of quantum gauge field models. It is shown that in the Coulomb gauge it is sufficient, as well as necessary, to restrict transverse potentials to the zero-free domain of the Faddeev-Popov determinant. Numerical studies of an SU(2) model support Gribov's suggestion (1978) that the zeros provide a natural way to understand the origin of confinement. (13 refs.)

99294 Explicit evaluation of physical quantities and supersymmetry properties of the lattice O(N) σ model at large N. P.Di Vecchia (Dept. of Phys., Univ. of Wuppertal, Wuppertal, Germany), R.Musto, F.Nicodemi, R.Pettorino, P.Rossi, P.Salomonson.
Phys. Lett. B (Netherlands), vol.127B, no.1-2, p.109-14 (21 July 1983).
The authors explicitly show how to extract physical quantities of the continuum theory from two lattice versions of the nonlinear σ model, that are exactly solvable for $N\to\infty$, they also build a lattice action which is supersymmetric in the large N limit and suggest how to recognize supersymmetry restoration in the continuum even when starting from a non-supersymmetric lattice formulation. (11 refs.)

99295 A study of finite sized Wilson Loops in the quenched Eguchi Kawai model. J.W.Carlson (Dept. of Phys., Univ. of California, Berkley, CA, USA).
Phys. Lett. B (Netherlands), vol.127B, no.1-2, p.115-18 10 4 (21 July 1983).
It is shown that expectation values of Wilson loops in a Monte Carlo calculation of quenched Eguchi Kawai on a lattice show unphysical behaviour as the size of the loop increases. Two reasons for this behaviour are discussed. (4 refs.)

99296 Perturbative fermion contribution to the average plaquette. H.Hamber, C.M.Wu (Inst. for Advanced Study, Princeton, NJ, USA).
Phys. Lett. B (Netherlands), vol.127B, no.1-2, p.119-22 (21 July 1983).
The fermion contribution to the average plaquette is evaluated analytically to lowest order in lattice perturbation theory for an arbitrary fermion regularization. To this order the effect of the fermions is to decrease it by an amount that is proportional to the number of fermion flavors. (7 refs.)

99297 Harmonic oscillator on a lattice. J.P.Ader, B.Bonnier, M.Hontebeyrie, C.Meyers (Lab. de Phys. Theorique, Univ. de Bordeaux I, Gradignan, France).
Phys. Lett. B (Netherlands), vol.127B, no.1-2, p.123-5 (21 July 1983).
The continuum limit of the ground state energy for the harmonic oscillator with discrete time is derived for all possible choices of the lattices derivative. The occurrence of unphysical values is shown to arise whenever the lattice laplacian is not strictly positive on its Brillouin zone. These undesirable limits can either be finite and arbitrary (multiple spectrum) or infinite (overlapping sublattices with multiple spectrum). (6 refs.)

99298 Zumino identities for super abelian gauge theories. J.Juer, G.Thompson (Dept. of Phys., Univ. of Southampton, Southampton, England).
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.204-8 (28 July 1983).
The authors derive Zumino identities relating Green's functions in different gauges, of the same class, for supersymmetric abelian gauge theories. They are shown to hold by a specific example at one loop order. Some comments are made on renormalisation and infrared divergences. (10 refs.)

99299 Monte Carlo measurement of the topological susceptibility in SU(3) lattice gauge theory. K.Fabricius (Dept. of Phys., Univ. of Wuppertal, Wuppertal, Germany), G.C.Rossi.
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.229-32 (28 July 1983).
A Monte Carlo measurement of the topological susceptibility $A=\int d^4x\langle 0|T(Q(x)Q(0))|0\rangle$, where $Q(x)$ is the topological charge density, is performed in the SU(3) case on a 4^4 lattice. The authors find in string tension units $A^{1/4}=(0.12\pm0.02)\sqrt{K}$ as in the SU(2) case. For $\sqrt{K}=420$ MeV this corresponds to $A^{1/4}=(50\pm10)$ MeV. (13 refs.)

99300 Limitations to the Coleman-Weinberg mechanism of spontaneous mass generation. H.Kleinert (Inst. of Theoretical Phys., Univ. of California, Santa Barbara, CA, USA).
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.69-72 (18 Aug. 1983).
The author points out that the second order phase transition of compact U(1) lattice gauge theory implies that a certain range of abelian Higgs models escapes the Coleman-Weinberg mechanism of spontaneous mass generation and suggests ways for a Monte Carlo investigation of the full range of its validity. (12 refs.)

99301 The connection between lattice gauge theories with Manton and Wilson actions. T.V.Shahbazyan (Yerevan Phys. Inst., Yerevan, USSR).
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.79-82 (18 Aug. 1983).
The SU(2) lattice gauge theory (LGT) with Manton's action is represented as the LGT with Wilson's action and effective coupling constant. A nonperturbative calculation of the ratio of Λ_L-parameters in the crossover region is performed and it is found that $\Lambda_L{}^M/\Lambda_L{}^W\approx3.7$. The β-dependence of the plaquette energy reproduces the Monte Carlo data for the LGT with Manton's action if the Monte Carlo data for the LGT with Wilson's action is known. (10 refs.)

99302 A practical scheme for SU(4) flavour symmetry breaking in lattice gauge theories. A.N.Burkitt, A.Kenway, R.D.Kenway (Dept. of Phys., Univ. of Edinburgh, Edinburgh, Scotland).
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.83-8 (18 Aug. 1983).
SU(4) flavour symmetry arises naturally in the continuum limit of free Susskind fermions on a four-dimensional lattice. It may be broken by including a mass term for each flavour. There is an optimum choice for the lattice mass term in the gauge theory, which breaks the flavour symmetry to SU(2) without increasing the non-locality of the action. (8 refs.)

99303 Renormalization-group study of four-dimensional SU(4) gauge theory. D.Barkai (Center for Appl. Vector Technol., Colorado State Univ., Fort Collins, CO, USA), M.Creutz, K.J.M.Moriarty.
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.86-90 (18 Aug. 1983).
Wilson loops for pure SU(4) gauge theory are calculated by Monte Carlo simulations on an 8^4 lattice. By comparing Wilson loops on different length scales, an ultraviolet stable attractive fixed point is located at vanishing bare coupling at which point asymptotic freedom is numerically verified. (10 refs.)

99304 Feynman path summation for the Dirac equation: an underlying one-dimensional aspect of relativistic particle motion. G.Rosen (Dept. of Phys., Drexel Univ., Philadelphia, PA, USA).
Phys. Rev. A (USA), vol.28, no.2, p.1139-40 (Aug. 1983).
It is observed that the Feynman path summation for the one-dimensional Dirac equation can be projected into three spatial dimensions to yield a path-summation formula for physical spin-$^1/_2$ particles of nonzero mass. Since the three-space projection matrix is independent of time and does not involve the particle's mass, relativistic motion governed by the Dirac equation has an underlying one-dimensional aspect. (4 refs.)

99305 Topological content of dimensional reduction. P.A.Zizzi (CERN, Geneva, Switzerland).
Phys. Rev. D (USA), vol.28, no.4, p.808-17 (15 Aug. 1983).
The author considers supersymmetric Yang-Mills theories which have nontrivial topological features and shows that in this case the dimensional-reduction technique has a topological content. It is found that a central charge of topological origin can be obtained, by dimensional reduction, from a topological charge in a higher-dimensional supersymmetry algebra (but not from an extra component of P_μ). This fact is interpreted in terms of commutative diagrams of spheres. (18 refs.)

99306 Supersymmetry on a lattice. J.Bartels (Dept. of Phys. & Astron., Rutgers Univ., New Brunswick, NJ, USA), J.B.Bronzan.
Phys. Rev. D (USA), vol.28, no.4, p.818-29 (15 Aug. 1983).
The authors develop Lagrangian and Hamiltonian lattice formulations of the Wess-Zumino model which preserve the superalgebra. The authors check that the lattice model passes into the continuum model in the zero-lattice-spacing limit, and obtain various perturbative results (nonrenormalization, effective-potential loop expansion) on the lattice. They study the phase structure with the one-loop effective potential and find dynamical symmetry breaking at large coupling in two dimensions, but not in four dimensions. Separately, they evaluate the strong-coupling limit in the Hamiltonian formulation and confirm the accuracy of the one-loop effective-potential predictions. These methods should apply to certain other supersymmetric theories. (19 refs.)

99307 Path-integral measure and anomalies for left-handed fermions. R.E.G.Saravi, F.A.Schaposnik (Dept. de Fisica, Univ. Nacional de La Plata, La Plata, Argentina), J.E.Solomin.
Phys. Rev. D (USA), vol.28, no.4, p.856-9 (15 Aug. 1983).
A path-integral measure for left-handed fermions is constructed for non-Abelian gauge theories and its properties under unitary transformations are discussed. (12 refs.)

99308 Monte Carlo computations in lattice gauge theories. M.Creutz (Phys. Dept., Brookhaven Nat. Lab., Upton, NY, USA), L.Jacobs, C.Rebbi.
Phys. Rep. (Netherlands), vol.95, no.4, p.201-82 (April 1983).
The formulation of gauge theories on Euclidean space-time lattices and the application of the Monte Carlo computational technique to the ensuing systems are reviewed. A variety of numerical results obtained for lattice gauge theories are presented and discussed. (120 refs.)

99309 The renormalization group and critical phenomena. K.G.Wilson (Lab. of Nuclear Studies, Cornell Univ., Ithaca, NY, USA).
Rev. Mod. Phys. (USA), vol.55, no.3, p.583-600 (July 1983).
This paper has three parts. The first part is a simplified presentation of the basic ideas of the renormalization group and the ϵ expansion applied to critical phenomena, following roughly a summary exposition given in 1972. The second part is an account of the history (as the author remembers it) of work leading up to the papers in 1971-1972 on the renormalization group. Finally, some of the developments since 1971 are summarized, and an assessment for the future given. (267 refs.)

99310 The lattice gauge theory approach to quantum chromodynamics. J.B.Kogut (Phys. Dept., Univ. of Illinois, Urbana, IL, USA).
Rev. Mod. Phys. (USA), vol.55, no.3, p.775-836 (July 1983).
The author reviews in a pedagogical fashion some of the recent developments in lattice quantum chromodynamics. This review emphasizes explicit examples and illustrations rather than general proofs and analyses. It begins with a discussion of the heavy-quark potential in continuum quantum chromodynamics. Asymptotic freedom and renormalization-group improved perturbation theory are discussed. A simple dielectric model of confinement is considered as an intuitive guide to the vacuum of nonAbelian gauge theories. Next, the Euclidean form of lattice gauge theory is introduced, and an assortment of calculational methods are reviewed. These include high-temperature expansions, duality, Monte Carlo computer simulations, and weak coupling expansions. A Λ-parameter calculation for asymptotically free-spin models is presented. The Hamiltonian formulation of lattice gauge theory is presented and is illustrated in the context of flux tube dynamics. Roughening transitions, Casimir forces, and the restoration of rotational symmetry are discussed. Mechanisms of confinement in lattice theories are illustrated in the two-dimensional electrodynamics of the planar model in the U(1) gauge theory in four dimensions. Generalized actions for SU(2) gauge theories and the relevance of monopoles and string to crossover phenomena are considered. A brief discussion of the continuity of fields and topological charge in asymptotically free lattice models is presented. The final major topic of this review concerns lattice fermions. The species doubling problem and its relation to chiral symmetry are illustrated. Staggered Euclidean fermion methods are discussed in detail, with an emphasis on species counting, remnants of chiral symmetry, Bloch spin variables, and the axial anomaly. Numerical methods for including fermions in computer simulations are considered. Jacobi and Gauss-Sidel inversion methods to obtain the fermion propagator in a background gauge field are reviewed. Langevin, pseudofermion Monte Carlo methods, and random walk methods are discussed, as are proposals for including the fermion determinant in computer simulations. Finally, spontaneous chiral symmetry breaking in lattice models is discussed. The review ends with brief remarks about present research directions. (120 refs.)

99311 Quantum non-local charge and exact S-matrix of the Gross-Neveu model. E.Abdalla, A.Lima-Santos (Inst. de Fisica, Univ. de Sao Paulo, Sao Paulo, Brazil).
Rev. Bras. Fis. (Brazil), vol.12, no.2, p.293-304 (June 1982).
Using nonperturbative methods the author proves conservation of the non-local quantum charge of the Gross-Neveu model (1974) providing an exact *S*-matrix. (8 refs.)

99312 On the infrared divergences of the CP^{n-1} models. B.B.Cobra, M.Gomes (Inst. de Fisica, Univ. de Sao Paulo, Sao Paulo, Brazil).
Rev. Bras. Fis. (Brazil), vol.12, no.4, p.693-705 (Dec. 1982).
The authors discuss some properties of the two-dimensional $SU(n)$ nonlinear sigma models, i.e. the CP^{n-1} models. They are $1/n$ expandable and ultraviolet renormalizable. Their main result is a proof that the infrared divergences associated with the topological gauge field are cancelled in the case of Green functions of gauge invariant operators. (10 refs.)

99313 Interaction constants as numerical characteristics of discrete spaces. V.N.Shchetochkin, V.N.Efremov (Geological Inst., Acad. of Sci., USSR).
Sov. Phys. J. (USA), vol.25, no.11, p.1030-4 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.11, p.62-7 (Nov. 1982).
On the basis of construction quantization of space, an expression is derived that gives a series of fundamental dimensionless constants in good agreement with experiment. (8 refs.)

99314 Dynamic mass formation and collective variables in a nonlinear spinor model. S.I.Kruglov (Inst. of Phys., Acad. of Sci., Belorussian SSR).
Sov. Phys. J. (USA), vol.25, no.11, p.1037-40 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.11, p.71-4 (Nov. 1982).
There exists many models in which the phase transition occurs from the symmetric (massless) to the nonsymmetric (mass) phase. Recently, interest in four-Fermion models has heightened because of the proof of their renormalizability upon decomposition into collective fields. The mechanism of dynamic mass formation in such theories can turn out to be an alternative to the known Higgs phenomenon. (11 refs.)

99315 Polarization symmetries of relativistic wave equations. V.I.Strazhev, P.L.Shkol'nikov (Inst. of Agriculture Mechanization, Belorussian SSR).
Sov. Phys. J. (USA), vol.25, no.11, p.1040-3 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.11, p.74-7 (Nov. 1982).
Generators of the group invariance of polarization origin U(2s+1) are constructed for relativistic wave equations (RWE), where s is the particle spin. Particular cases of the vector (mass) and Dirac fields are examined. (8 refs.)

99316 Multispin particles and non-abelian tensor gauge fields. S.I.Kruglov, V.I.Strazhev (Inst. of Agricultural Mechanization, Belorussian SSR).
Sov. Phys. J. (USA), vol.25, no.11, p.1043-5 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.11, p.78-81 (Nov. 1982).
A system of tensorial equations is suggested as a bipotential generalization of the Stuckelberg equations written for spin-tensors. These equations describe particles having two spin states: 1/2 and 3/2 (particles with the multispin 1/2, 3/2). The Lagrangian of the theory is invariant under the transformations of the field variables forming a group $U(1)\otimes SO(4, 2)\otimes SO(4, 2)$. Localization of the transformation parameters of this group of internal symmetry leads to introduction of a non-Abelian gauge field carrying the maximal spin 2. A possible physical interpretation of a multispin particle theory is discussed. (12 refs.)

99317 Radiative correction to the energy of a fermion in an external gauge field. V.Ch.Zhukovskii, I.B.Morozov, A.V.Borisov (M.V. Lomonosov Moscow State Univ., Moscow, USSR).
Sov. Phys. J. (USA), vol.25, no.11, p.1066-7 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.11, p.102-4 (Nov. 1982).
The first radiative correction in g^2 to the energy of the state of a fermion in a constant uniform gauge (for the SU(2) group) field of magnetic type is calculated. The expression obtained contains an indication of instability of the ground state. (10 refs.)

99318 Various U_1 gauge theories and Riemannian geometry on U_1 bundle with a scalar functional. An Ying, Chen Shi, Guo Hanying (Inst. of Theoretical Phys., Acad. Sinica, Beijing, China).
Sci. Sin. (China), vol.26, no.6, p.618-25 (June 1983).
By means of the Riemannian geometry on U_1 principal bundle with a gauge invariant scalar function or functional the authors reexamine various U_1 gauge theories including the Maxwell theory, Born-Infeld theory, Johnson type confinement theory, and massive U_1 gauge theory, and propose an 'electron bubble' model. All these theories can be expressed as some kind of the Kaluza type theories on the Minkowskian spacetime. They also propose an action for a scalar-vector U_1 gauge theory in which the scalar field is an independent dynamical variable and represents the property of the vacuum. Based on the assumption that the test particles in these fields move along the geodesics on the bundle space they obtain the conservation equation of the charge-to-mass ratio and the equation of motion of test particles. (14 refs.)

99319 The Pade method for the study of renormalization-group equations in the region of intermediate and strong coupling. S.A.Gadzhiev (Azerbaidjhan State Univ., Baku, Azerbaidzhan SSR), I.M.Dremin, V.Ya.Fainberg.
Sov. Phys.-Lebedev Inst. Rep. (USA), no.10, p.21-6 (1982). Translation of: *Sb. Kratk. Soobshch. Fiz. AN SSSR Fiz. Inst. P.N. Lebedeva*, no.10, p.24-30 (1982).
The Pade method is used for the summation of the perturbation series for the β function. By using the asymptotic behavior of the β function in the strong-coupling limit, one can obtain chromodynamic confinement (taking into account the three-loop approximation for β), and a resonable behavior of the renormalization-invariant charge. (13 refs.)

99320 Application of inverse scattering method to singular solutions of nonlinear equations. I. V.A.Arkad'ev, A.K.Pogrebkov, M.K.Polivanov (V.A. Steklov Math. Inst., Acad. of Sci., USSR).
Theor. & Math. Phys. (USA), vol.53, no.2, p.1051-62 (Nov. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.2, p.163-80 (Nov. 1982).
The Jost solutions and the transition matrix for the Zakharov-Shabat system are constructed in the case of potentials that have a finite number of 1/x singularities. The analytic properties of the transition matrix are investigated and scattering data are introduced. (12 refs.)

99321 Unitarity bounds for multiparticle interaction amplitudes. A.A.Arkhipov (Inst. of High Energy Phys., Serpukhov, USSR).
Theor. & Math. Phys. (USA), vol.53, no.2, p.1067-84 (Nov. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.2, p.188-215 (Nov. 1982).
A regular method is constructed for finding asymptotic bounds that generalise Froissart's well-known result (1961) to the case of multiparticle interaction. (17 refs.)

99322 Hidden symmetries for some classical field models. R.P.Zaikov (Joint Inst. for Nuclear Res., Dubna, USSR).
Theor. & Math. Phys. (USA), vol.53, no.2, p.1099-107 (Nov. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.2, p.238-49 (Nov. 1982).
The existence of hidden symmetries for an action invariant with respect to space-time transformations K and internal transformations G is investigated. For this purpose, transformations with generators that are functions of the coordinates are considered. For these functions, differential equations are obtained from the condition of invariance of the action. Solutions of these equations are found in the two-dimensional case. It is shown that the coordinate transformations depend on the fields and that the corresponding higher conserved quantities are of the Noether type. (10 refs.)

99323 Structure of the energy-momentum tensor and the spin tensor in a covariant theory of a spinor field. B.A.Levitskii, Yu.A.Yappa (Leningrad State Univ., Leningrad, USSR).
Theor. & Math. Phys. (USA), vol.53, no.2, p.1107-13 (Nov. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.2, p.250-9 (Nov. 1982).
A covariant generalisation of the second part of Noether's theorem (1918) is obtained for a spinor field in Riemannian space-time. Differential relations for the energy-momentum tensor and the spin tensor are derived from the conditions of invariance of the field equations with respect to arbitrary infinitesimal variations of the coordinates and the tetrad components. The symmetrisation of the energy-momentum tensor of the spinor field is considered. (15 refs.)

99324 Parastatistics and gauge symmetries. A.V.Govorkov (Joint Inst. for Nuclear Res., Dubna, USSR).
Theor. & Math. Phys. (USA), vol.53, no.2, p.1127-35 (Nov. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.2, p.283-95 (Nov. 1982).
It is shown that in Green's parafield theory it is possible to construct a unique nonlinear Lagrangian equivalent to the Yang-Mills gauge Lagrangian of SO(3) symmetry. Thus, Greenberg's paraquark hypothesis (1964) is not equivalent to the hypothesis of quark colour $SU(3)_c$ symmetry. The features of the SO(3) gauge are analysed and an interesting possibility of its use as an exact subgroup of broken $SU(3)_c$ is pointed out. (31 refs.)

99325 Connection between the sine-Gordon model and the massive Bose Thirring model. F.A.Smirnov (V.A. Steklov Math. Inst., Acad. of Sci., USSR).
Theor. & Math. Phys. (USA), vol.53, no.3, p.1153-60 (Dec. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.3, p.323-34 (Dec. 1982).
In the framework of the quantum inverse scattering technique connections are established between the sine-Gordon model and the massive Bose Thirring model. The classical significance of the vacuum filling in the sine-Gordon model is elucidated. (14 refs.)

99326 Invariant infrared regularization for supersymmetric Yang-Mills fields. A.A.Slavnov, B.A.Faizullaev (V.A. Steklov Math. Inst., Acad. of Sci., USSR).
Theor. & Math. Phys. (USA), vol.53, no.3, p.1161-4 (Dec. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.3, p.335-41 (Dec. 1982).
A scheme of infrared regularization for supersymmetric Yang-Mills fields is constructed. It is shown that it preserves the gauge symmetry. (5 refs.)

99327 A method of solving quasipotential equations. A.A.Arkhipov, V.I.Savrin (Inst. of High Energy Phys., Serpukhov, USSR).
Theor. & Math. Phys. (USA), vol.53, no.3, p.1165-75 (Dec. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.3, p.342-57 (Dec. 1982).
A method is proposed for solving quasipotential equations in the configuration space on the basis of a special integral transformation. The Coulomb problem is solved by this method. The class of potentials that admit exact solution of quasipotential equations with discrete spectrum is described. The connection between the proposed method and the approach based on expansion of the wave function with respect to irreducible unitary representations of the Lorentz group is established. (23 refs.)

99328 Explicitly integrable models of quantum field theory with exponential interaction in two-dimensional space. A.N.Leznov, I.A.Fedoseev (Inst. of High Energy Phys., Serpukhov, USSR).
Theor. & Math. Phys. (USA), vol.53, no.3, p.1175-85 (Dec. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.3, p.358-73 (Dec. 1982).
Explicit expressions are obtained for the Heisenberg operators of the two-dimensional models of quantum field theory described by the system of equations $\Box u_\alpha = g\ \exp(ku)_\alpha$ as functionals of asymptotic fields $\phi_\alpha{}^{in}$ satisfying the equations $\Box\phi_\alpha{}^{in}=0$ and appropriate commutation relations. It is shown that in the presence of a finite-dimensional internal symmetry group, when k is the Cartan matrix of a semisimple Lie group, the perturbation series for the operators $\exp(-{}^{u}{}_{\alpha})$ degenerate into polynomials in the coupling constant g, the degrees of the polynomials being related to the structure of the fundamental representations of the corresponding group. (10 refs.)

99329 Finite temperature SU(2) gauge theory with external magnetic field. Y.Fujimoto, T.Fukuyama (Internat. Centre for Theoretical Phys., Trieste, Italy).
Z. Phys. C (Germany), vol.19, no.1, p.11-17 (1983).
The authors employ the heat kernel method to evaluate the effective potential of the *SU*(2) gauge theory (with scalar triplet) when both external magnetic field and temperature are applied. The calculation is performed using high temperature approximation. (7 refs.)

99330 Gauge invariance and fermion doubling on the lattice. R.Stacey (Dept. of Appl. Math. & Theoretical Phys., Univ. of Liverpool, Liverpool, England).
Z. Phys. C (Germany), vol.19, no.1, p.75-8 (1983).
The author considers a possible chiral invariant solution of the lattice fermion doubling problem. This makes the unwanted states decouple in the continuum limit, at least in the noninteracting theory. The introduction of gauge interactions restores doubling. He examines how local gauge invariance makes all the species in a doubled spectrum act alike. He generalises earlier results to show how gauge invariance forces a doubled spectrum even when other considerations do not. (8 refs.)

99331 The generalized non-Abelian Toda lattice. Z.Popowicz (Inst. of Theoretical Phys., Univ. of Wroclaw, Wroclaw, Poland).
Z. Phys. C (Germany), vol.19, no.1, p.79-81 (1983).
The author constructs a Backlund transformation and inverse scattering form for the generalized nonAbelian Toda lattice. He investigates the continuum limit and shows that the model, in this limit, is equivalent to the self-dual sector of the three dimensional *SU*(*N*) Yang-Mills field theory. (9 refs.)

99332 Group contraction and macroscopic quantum systems. G.Vitiello (Istituto di Fisica, Univ. di Salerno, Salerno, Italy).
Group Theoretical Methods in Physics. Proceedings of the XI International Colloquium, Istanbul, Turkey, 23-28 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.403-6
The physical significance of group contraction in quantum field theories with spontaneous breakdown of symmetry is discussed. Low-energy theorems and macroscopic ordered state symmetry patterns and structures are observable manifestations of group contraction. (14 refs.)

99333 The algebraic geometry of multimonopoles. W.Nahm.
Group Theoretical Methods in Physics. Proceedings of the XI International Colloquium, Istanbul, Turkey, 23-28 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.456-66 (9 refs.)

99334 Dimensional reduction, spinor fields and characteristic classes. H.Romer (Facultat fur Phys., Univ. Freiburg, Freiburg, Germany).
Group Theoretical Methods in Physics. Proceedings of the XI International Colloquium, Istanbul, Turkey, 23-28 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.467-80
The effect of dimensional reduction, both global and local, on natural vector bundles over higher dimensional manifolds and on characteristic classes is investigated. In particular spinor fields are considered and a new mechanism for introducing a generalized spin structure by dimensional reduction is proposed. (17 refs.)

99335 Fermion fractionization in physics. R.Jackiw (Center for Theoretical Phys., MIT, Cambridge, MA, USA).
Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop, London, England, 3-21 Aug. 1981 (Cambridge, England: Cambridge 1982), p.169-83
Discusses a novel quantum mechanical/topological phenomenon that has become a focus for contemporary research in theoretical and experimental physics as well as in mathematics. The effect is as easy to describe as it is puzzling to comprehend: when a fermion is introduced to a soliton, the fermion can split up—it can fractionize—and its quantum numbers are shared by the resulting states. In this way, fractional charge can emerge in a theory where all basic constituents carry integral charges. The author describes relativistic field theory calculations. (16 refs.)

99336 Experimental tests of gauge theories. G.Barbiellini (Lab. Nazionali di Frascati, INFN, Frascati, Italy).
Proceedings of the 1982 CERN School of Physics (CERN 83-05), Cambridge, England, 5-18 June 1982 (Geneva, Switzerland: CERN 1983), p.1-68
The author presents recent results in elementary particle physics which support the most general properties of gauge theories, such as the Lorentz nature of the gauge interaction and the universality of the weak coupling constant. The standard Glashow-Salam-Weinberg model of electroweak interactions and its support from charged-current and neutral-current interactions is discussed. The author then reviews the verification experiments for QCD, with emphasis on the limitations found. Finally, the experimental search for baryon number isolation, the prediction of the grand unified theory, is described. (52 refs.)

99337 Introduction of gauge theories. B.de Wit (NIKHEF-H, Amsterdam, Netherlands).
Proceedings of the 1982 CERN School of Physics (CERN 83-05), Cambridge, England, 5-18 June 1982 (Geneva, Switzerland: CERN 1983), p.69-101
Local gauge invariance is discussed, and a class of field theories exhibiting this property, for both Abelian and non-Abelian gauge groups, is constructed. The general implications of gauge invariance are discussed, and the author outlines how gauge theories can spontaneously acquire mass. (7 refs.)

99338 Lattice gauge theory. C.Michael (DAMTP, Univ. of Liverpool, Liverpool, England).
Proceedings of the 1982 CERN School of Physics (CERN 83-05), Cambridge, England, 5-18 June 1982 (Geneva, Switzerland: CERN 1983), p.265-80
Monte Carlo simulation methods for quantum field theory on a lattice are motivated and applications to quantum chromodynamics are discussed. The extraction of physical information concerning confinement, asymptotic freedom and hadronic masses is described. (9 refs.)

99339 Elementary methods for statistical systems, mean field, large n, and duality. C.Itzykson (CENS, Gif-sur-Yvette, France).
Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981, Freiburg, Germany, 31 Aug.-11 Sept. 1981 (New York, USA: Plenum 1983), p.61-92
The author surveys approximation schemes developed in the context of statistical mechanics and applicable to renormalisable field theories. (18 refs.)

99340 Phases in gauge theories. S.Yankielowicz (Tel-Aviv Univ., Tel-Aviv, Israel).
Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981, Freiburg, Germany, 31 Aug.-11 Sept. 1981 (New York, USA: Plenum 1983), p.115-39
Gauge theories are believed to belong to the class of theories which describe nature. At each energy (distance) scale nature can be described in terms of an effective gauge theory. For example, at present available energies physics seem to be correctly described by the standard $SU_C(3)\times SU(2)\times U(1)$ theory. It is important to note that degrees of freedom which are considered elementary on a given scale may turn out to be composite at a higher energy scale. Given the (effective) gauge theory, its large distance properties (phase struc-

ture, symmetry realization, etc.) are determined by the structure of the vacuum. The author concentrates on two aspects of the vacuum structure in gauge theories (without and with fermions): phases in pure gauge theories, and dynamical symmetry breaking—chiral symmetry realization. (30 refs.)

99341 Some new integrable models in field theory and statistical mechanics. H.de Vega (Lab. de Phys. Theorique et Hautes Energies, Univ. Pierre et Marie Curie, Paris, France).
Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981, Freiburg, Germany, 31 Aug.-11 Sept. 1981 (New York, USA: Plenum 1983), p.179-89
The triangular relations (also called factorization equations or Yang-Baxter equations) are the clue of the resolution of two-dimensional integrable models in quantum field theory and statistical mechanics. (15 refs.)

99342 Calculating the large N phase transition in lattice gauge theories. S.Samuel (Phys. Dept., Columbia Univ., New York, NY, USA).
Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981, Freiburg, Germany. 31 Aug.-11 Sept. 1981 (New York, USA: Plenum 1983), p.191-9
Aspects of the large N phase transition in lattice gauge theories are reviewed. (21 refs.)

99343 The hidden fermions in Z(2) theories. M.Srednicki (Joseph Henry Labs., Princeton Univ., Princeton, NJ, USA).
Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981, Freiburg, Germany, 31 Aug.-11 Sept. 1981 (New York, USA: Plenum 1983), p.229-39
In 1964, Schultz, Mattis, and Lieb (SML) showed that the two dimensional Ising model is equivalent to a system of locally coupled fermions. After a canonical transformation, these fermions become noninteracting, and so SML were able to construct a simple, elegant, and exact solution. Recently, Fradkin, Susskind, and Srednicki (1980) (FSS) showed that the three dimensional Z(2) gauge theory could also be rewritten in terms of locally coupled fermionic degrees of freedom. Unfortunately, the coupling turned out to be quartic, and so they were unable to solve the theory. In order to make the change to fermionic variables, both FSS and SML used a Jordan-Wigner transformation. This technique is limited to low dimensions (two for the Ising model and three for the gauge theory) if one demands local couplings only. Nevertheless, it seems intuitively plausible that higher dimensional Z(2) theories are also fermionic theories in disguise. The author shows that this is correct. Ising models and Z(2) gauge theories, in any number of dimensions, are equivalent to systems of locally coupled fermions. (10 refs.)

99344 Remarks on alternative lattice actions and phase structure of lattice models. H.Grosse (Inst. fur Theoretische Phys., Univ. Wien, Wien, Austria).
Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981, Freiburg, Germany, 31 Aug.-11 Sept. 1981 (New York, USA: Plenum 1983), p.241-8
The author states the requirements of lattice gauge theories, remarks that Manton's action violates reflection positivity, mentions the equivalence of Z_4 and $Z_2 \times Z_2$ theories and discusses how well the SU(3) gauge theory is approximated by taking nonAbelian subgroups as a gauge group. (17 refs.)

99345 Functional integration for kinks and disorder variables. B.Schroer (Inst. fur Theoretische Phys., Freie Univ., Berlin, Germany).
Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981, Freiburg, Germany, 31 Aug.-11 Sept. 1981 (New York, USA: Plenum 1983), p.261-71
Kinks or topological solitons have been known for a long time in classical nonlinear field theories. The kink solution of the two-dimensional ϕ^4 model and the one-soliton solution of the sine-Gordon equation are important and well-known special cases. Arguments based on topological stability assert that particle quantum states corresponding to such classical solutions are expected to exist, and hence a quasiclassical approach for the particle spectrum and the S-matrix appears theoretically justified. A systematic study of this approach with a hindsight from Nuclear Physics suggests the introduction of collective coordinate methods. The many papers published on the semiclassical and collective coordinate approach to the kink problem allow one clearcut conclusion: the formalism becomes complicated and loses its aesthetical appeal if used for the construction of field theoretic ('off mass shell') objects such as vacuum expectation values or matrix elements of products of fields. This feature is in fact to be expected in a formalism which treats a Lagrangian field simultaneously with the quantum mechanical degrees of freedom of the kink states. (12 refs.)

99346 Continuum (scaling) limits of lattice field theories (triviality of $\lambda\phi^4$ in $d \geq 4$ dimensions). J.Frohlich (Inst. des Hautes Etudes Sci., Bures-sur-Yvette, France).
Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981, Freiburg, Germany, 31 Aug.-11 Sept. 1981 (New York, USA: Plenum 1983), p.273-86
The author describes some recent techniques for constructing the continuum (=scaling) limit of lattice field theories, including the one- and two-component $\lambda|\phi|^4$ theories and the Ising and rotator models in a space (imaginary time) of dimension $d \geq 4$. These techniques should have applications to other related models, like the self-avoiding random walk in five or more dimensions and bond percolation in seven or more dimensions. Some plausible conjectures concerning the Gaussian nature of the scaling limit of the $d \geq 2$ dimensional rotator model and the $d \geq 4$ dimensional U(1) lattice gauge theory in the low temperature (weak coupling) phase are described. (28 refs.)

99347 Schrodinger representation in renormalizable quantum field theory. K.Symanzik (DESY, Hamburg, Germany).
Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981, Freiburg, Germany, 31 Aug.-11 Sept. 1981 (New York, USA: Plenum 1983), p.287-99 (18 refs.)

99348 All self-dual multimonopoles for arbitrary gauge groups. W.Nahm (CERN, Geneva, Switzerland).
Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981, Freiburg, Germany, 31 Aug.-11 Sept. 1981 (New York, USA: Plenum 1983), p.301-10
The ADHM formalism is adapted to self-dual multimonopoles for arbitrary charge and arbitrary gauge group. Each configuration is characterized by a solution of a certain ordinary nonlinear differential equation, which has chances to be completely integrable. For axially symmetric configurations it reduces to the integrable Toda lattice equations. The construction of the potential requires the solution of a further ordinary linear differential equation. (14 refs.)

99349 Renormalization group aspects of 3-dimensional pure U(1) lattice gauge theory. M.Gopfert, G.Mack (Inst. fur Theoretische Phys., Univ. Hamburg, Hamburg, Germany).
Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981, Freiburg, Germany, 31 Aug.-11 Sept. 1981 (New York, USA: Plenum 1983), p.311-15
The authors have studied the 3-dimensional pure U(1) lattice gauge theory model with Villain action. It was expected on the basis of the work of Polyakov (1977), Banks, Myerson and Kogut (1977) and others that this model would show confinement for all values of the coupling constant. They have proved that this is indeed the case. There were also some surprises, however, and it is of interest to discuss these from the point of view of the renormalisation group theory. (11 refs.)

99350 Ground state metamorphosis for Yang-Mills fields on a finite periodic lattice. A.Gonzalez-Arroyo, J.Jurkiewicz, C.P.Korthals-Altes (CNRS, Marseille, France).
Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981, Freiburg, Germany, 31 Aug.-11 Sept. 1981 (New York, USA: Plenum 1983), p.339-58
The authors study the weak coupling behaviour of the partition function of nonAbelian gauge fields on a finite lattice. Periodic boundary conditions are imposed. Two different power laws in the coupling β^{-1} arise for the partition function, when the dimension d of space time is larger or smaller than a critical dimension d_c. For SU(2) $d_c=4$ the authors find at this dimension power behaviour corrected by log β. The phenomenon is of practical importance in Monte Carlo simulations of the twisted action. (13 refs.)

99351 Lattice fermions and Monte Carlo simulations. P.Hasenfratz (CERN, Geneva, Switzerland).
Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981, Freiburg, Germany, 31 Aug.-11 Sept. 1981 (New York, USA: Plenum 1983), p.359-67 (16 refs.)

11.30 SYMMETRY AND CONSERVATION LAWS

(see also 02.20 Group theory)

99353 Linear potential and spontaneous breakdown of chiral symmetry. O.Pene (Lab. de Phys. et Hautes Energies, Univ. Paris XI, Orsay, France).
Acta Phys. Pol. B (Poland), vol.B14, no.7, p.499-509 (July 1983).
After a brief pedagogical reminder of the standard ideas about spontaneous chiral symmetry breaking, the author shows, after Nambu (1961) how the ideas of BCS theory of superconductivity can be applied to explain dynamically spontaneous chiral symmetry breaking. More specifically, the Bogoliubov-Valatin variational method is applied to a model of massless quarks interacting via a chiral invariant attractive color linear potential. It is shown analytically that due to the quark's negative self energy, chiral symmetry is spontaneously broken in this model for any value of the parameters. (5 refs.)

99354 Space and time reversals. III. Pseudo-linear wave equations; special broken symmetries. A.Blandin (Lab. de Phys. des Solides, Univ. de Paris-Sud, Orsay, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.19, p.1477-80 (30 May 1983). In French.
For pt.II see ibid., vol.295, p.641 (1982). The author defines the concept of pseudolinear equations: equations linear to the functions and their derivatives; but both equation operator and functions may have terms proportional to I, i, K or iK. A primary example of pseudolinear equations exhibits clearly the new features: special broken symmetry, two kinds of modes, crossing of the modes through reversal. A second example, taken from quantum mechanics, exhibits the same features which appear completely new. The conclusion emphasizes the new properties of pseudolinear equations and the notion of special broken symmetries and its possible applications: irreversibility, complete nonconservation of parity. (1 ref.)

99355 .A property of the structure constants of finite dimensional compact simple Lie algebras. M.L.Metha, J.M.Normand (CENS, Gif-sur-Yvette, France), V.Gupta.
Commun. Math. Phys. (Germany), vol.90, no.1, p.69-78 (1983).
Considers products of structure constants of a finite-dimensional compact simple Lie algebra, in which all indices except a few are contracted in pairs. The authors prove that such a product is zero if only one index is free, is proportional to the Cartan-Killing tensor if two indices are free and is proportional to a structure constant itself if three indices are free. For SU(n), $n\geq 3$ they also consider products of usual d (related to the anti-commutator) and structure constants f. The results for one and two free indices are still valid. For three free indices the product is proportional to either an f or a d according to whether the number of fs in the product is odd or even. (7 refs.)

99356 Kronecker product of Sp(2*n*) representations using generalised Young tableaux. G.Girardi, A.Sciarrino, P.Sorba (LAPP, Annecy-le-Vieux, France).
J. Phys. A (GB), vol.16, no.12, p.2609-14 (21 Aug. 1983).
Using generalised Young tableaux, the authors obtain an explicit formula for the reduction of the Kronecker product of irreducible representations of the symplectic groups. This extends a previous work devoted to the case of orthogonal groups. (11 refs.)

99357 Geometric aspects of supersymmetry and quantisation of fermions. V.Aldaya, J.A.de Azcarraga (Dept. de Fisica Teorica, Univ. de Valencia, Valencia, Spain).
J. Phys. A (GB), vol.16, no.12, p.2633-9 (21 Aug. 1983).
The authors analyse the geometric content of some aspects of supersymmetry by generalising a procedure of geometric quantisation recently proposed. The method is entirely based on a group, the 'quantum group'; by generalising it to a supergroup they are able to quantise simultaneously bosons and fermions and to exhibit the geometric origin of the so-called covariant derivatives. The paper is restricted to Galilean supersymmetry, but this is not a limitation of the procedure which applies to extended super-Poincare supersymmetry as well. (27 refs.)

99358 Clebsch-Gordan coefficients for SU(5)⊃SU(3)×SU(2)×U(1) theories. In-Gyu Koh, J.Patera, C.Rousseau (Centre de Recherche de Math. Appliquees, Univ. de Montreal, Montreal, Quebec, Canada).
J. Math. Phys. (USA), vol.24, no.8, p.1955-67 (Aug. 1983).
The Clebsch-Gordan coefficients are calculated for the following tensor products of SU(5) representations: $5\otimes 5$, $5\otimes 10$, $5\otimes\overline{10}$, $15\otimes 5$, $15\otimes\bar{5}$, $10\otimes 10$, $5\otimes\bar{5}$, $10\otimes\overline{10}$, $5\otimes 24$, and $10\otimes 24$. Each case is calculated twice: once in a weight vector basis independent of any semisimple subgroup, the second time in a basis which refers to SU(3)×SU(2)×U(1)⊂SU(5). (9 refs.)

99359 Octonionic description of exceptional Lie superalgebras. A.Sudbery (Dept. of Maths., Univ. of York, Heslington, England).
J. Math. Phys. (USA), vol.24, no.8, p.1986-8 (Aug. 1983).
The structures of the exceptional Lie superalgebras G(3) and F(4) are expressed in terms of octonions. (6 refs.)

99360 Reduction of the U(∞) supersymmetry theory to a random-matrix model. R.L.Mkrtchyan, S.B.Khokhlachev (L.D. Landau Inst. of Theoretical Phys., Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.3, p.193-5 (5 Feb. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.3, p.160-1 (5 Feb. 1983).
The limit $N\rightarrow\infty$ is analysed for U(N)-invariant supersymmetry theories. It is shown that it is not necessary to to freeze the momenta when such theories are reduced to a random matrix model by the Eguchi-Kawai method (1982). This assertion significantly simplifies numerical calculations in such theories. (7 refs.)

99361 A variational approach to Backlund and infinitesimal Backlund transformation for Kadomtsev-Petviashvili equation. A.Roy Chowdhury, S.Ahmad (Dept. of Phys., Jadavpur Univ., Calcutta, India).
Phys. Lett. A (Netherlands), vol.97A, no.3, p.81-4 (15 Aug. 1983).
A new form of the Backlund transformation for the Kadomtsev-Petviashvili equation is obtained through the variational formalism. At no stage do the authors use the equation of motion for the deduction of the Backlund transformation. So they follow the method of Steudel (1975) for the derivation of the infinite number of conservation laws using Noether's theorem in three dimensions and the corresponding infinitesimal Backlund transformation. (9 refs.)

99362 Search for supersymmetry at the $\bar{p}p$ collider. J.Ellis, J.S.Hagelin (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA), D.V.Nanopoulos, M.Srednicki.
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.233-41 (28 July 1983).
Many models of broken supersymmetry predict the existence of supersymmetric fermions $\chi^{\pm,0}$ with masses less than the $W^{\pm}$ and Z^0. Often there are two light neutral fermions χ^0, even in models with large gaugino masses. The $W^{\pm}$ have large branching ratios for decays into $\chi^{\pm}+\chi^0$, with the $\chi^{\pm}$ subsequently decaying into χ^0 plus hadrons or leptons. The authors propose looking at the CERN $\bar{p}p$ collider for $W^{\pm}$ production and decay into supersymmetric fermions, a likely signature being 'zen' events with one broadened hadronic jet system recoiling against invisible missing transverse energy. (19 refs.)

99363 Flavour changes in locally supersymmetric theories. J.F.Donoghue (Dept. of Phys. & Astron., Univ. of Massachusetts, Amherst, MA, USA), H.P.Nilles, D.Wyler.
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.55-60 (18 Aug. 1983).
Locally supersymmetric models lead in general to flavour-changing gluino exchanges. The authors derive the necessary expressions for describing them in detail. They show that the K^0-$\bar{K}^0$ mixing puts a lower bound on the gravitino mass and gives new restrictions on the Kobayashi-Maskawa angles. (14 refs.)

99364 SUSY-breaking without sliding VEV. N.Dragon (Inst. fur Theoretische Phys., Univ. Heidelberg, Heidelberg, Germany).
Z. Phys. C (Germany), vol.19, no.2, p.115-17 (1983).
In the absence of gauge interactions the spontaneous breakdown of supersymmetry (SUSY) is accompanied by a scalar field whose vacuum expectation value is not determined by the tree potential. Inclusion of the gauge interactions can fix this VEV at the tree level. The situation is exemplified by a simple *SU*(2)-model yielding nonvanishing *F*- and *D*-VEVs. (5 refs.)

99365 SU(3) in an O(3) basis: eigenvalue spectrum of the Q_l^0 and O_l^0 operators. G.Vanden Berghe, H.De Meyer, J.Van der Jeugt (Rijksuniv. Gent, Gent, Belgium).
Group Theoretical Methods in Physics. Proceedings of the XI International Colloquium, Istanbul, Turkey, 23-28 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.452-3
Hughes (1973) introduced for the SU(3)⊃O(3) group-subgroup system two invariants which he denoted as O^0 and Q_l^0. He developed a method based on shift operator techniques by which it was possible to derive general expressions in closed form for the eigenvalue spectra of both operators. The analysis was based upon relations between O(3) quadratic and triple scalar product operators of the O_l^k ($k=0, \pm 1, \pm 2$) type. Recently the authors have improved Hughes' method by considering also the relations between the O(3) non-scalar quadratic product operators of the O_l^k type. The new approach which they comment on here, consists in constructing shift operators Q_l^k ($-2\leq k\leq 2$), which are quadratic in the generators q_μ ($|\mu|\leq 2$), forming together with the three O(3) generators l_O, $l_{\pm}$ the algebra SU(3). The scalar Q_l^O introduced previously by Hughes, belongs to that class. It can be proven that all Q_l^s operators are expressible in terms of products of the type $O_{l+k}{}^jO_l^k$ ($j+k=s$). (2 refs.)

99366 SU(4) in an SO(4) basis: shift operator technique. J.Van der Jeugt, G.Vanden Berghe, H.De Meyer (Rijksuniv. Gent, Gent, Belgium).
Group Theoretical Methods in Physics. Proceedings of the XI International Colloquium, Istanbul, Turkey, 23-28 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.454-5
The reduction of irreducible representations (IRs) (p p′p″) of SU(4) into IRs (s,t) of SO(4)=SU(2)⊗SU(2) leads to a two missing label problem. Within the shift operator formalism a basis of four functionally independent SO(4) scalars in the enveloping algebra of SU(4) can be constructed. The basis consists of the SO(4) scalar shift operator of lowest degree (which is proportional to Ω) and three linear combinations of quadratic shift operator product of scalar type. A vast amount of relations connecting these basis elements can be set up. With the aid of these, closed analytic formulae producing Ω- and Π- eigenvalues are easily deduced, even for cases of degeneracy in the SO(4) labels. (3 refs.)

99367 Extended supercurrents and the ultraviolet finiteness of N=4 supersymmetric Yang-Mills theory. K.S.Stelle (Lab. de Phys. Theorique, Ecole Normale Superieure, Paris, France).
Quantum Structure of Space and Time. Proceedings of the Nuffield Quantum Gravity Workshop, London, England, 3-21 Aug. 1981 (Cambridge, England: Cambridge 1982), p.337-61
Examines the questions of renormalization and stress tensor multiplet structure for N=1 to N=4 supersymmetries. The most interesting question to be faced is why the N=4 supersymmetric. Yang-Mills theory appears to have a vanishing β-function, as has been discovered by explicit calculations carried out to the three loop order (Tarasov et al. 1980; Grisaru et al. 1980, 1981; Caswell and Zanon 1981). Since a manifestly N=4 supersymmetric set of Feynman rules for this theory is not known, any attempt to explain the vanishing of the β-function from fundamental principles must rely upon a set of assumptions concerning the preservation of the extended supersymmetries or of the internal symmetries of the model. Arguments directed toward a demonstration that the β-function vanishes have been given by Ferrara and Zumino (1978) and by Sohnius and West (1981). These arguments rely on properties of the stress tensor multiplet in the presence of anomalies in N=1 and N=2 supersymmetry. After a discussion of the multiplet structure for anomalies in N=1 and N=2 supersymmetries, the author re-examines the arguments given concerning N=4 Yang-Mills theory in the light of the structure of the full N=4 stress tensor supermultiplet. (45 refs.)

99368 Strong CP violation and axions. C.Jarlskog (Dept. of Phys., Univ. of Bergen, Bergen, Norway).
Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981, Freiburg, Germany, 31 Aug.-11 Sept. 1981 (New York, USA: Plenum 1983), p.159-70
The axionic solution of the strong CP-violation is quite an exciting possibility. Its ingredients span over a large domain of theoretical ideas. The problem involves the vacuum structure of QCD, the so-called θ-vacua, topological charges and instantons. The essential elements of the solution are the axial anomaly, chiral symmetry and its spontaneous breakdown, Goldstone bosons, current algebra, Higgs scalars, gauge theories and more recently grand unification. 11.40 CURRENTS AND THEIR PROPERTIES

99369 Fermion currents in 1+1 dimensions. A.L.Carey (Dept. of Pure Math., Univ. of Adelaide, Adelaide, Australia), C.A.Hurst, D.M.O'Brien.
J. Math. Phys. (USA), vol.24, no.8, p.2212-21 (Aug. 1983).
Let $\mathcal{F}$ denote the Fock space for a free massless fermion field in two space-time dimensions. If Q and Q_5 denote the charge and chiral charge operators, then $\mathcal{F}=\oplus\mathcal{F}_{n1,n2}$, where $\mathcal{F}_{n1,n2}$ is the joint eigenspace of Q and Q_5 with corresponding eigenvalues n_1 and n_2. The smeared time-zero free fermion currents formally given by $J_\mu(f)=\int:\bar\psi(x)\gamma_\mu\psi(x):f(x)dx[\mu=0,1;f\$G\in s(\mathbf{R})]$ are in fact self-adjoint densely defined operators on $\mathcal{F}$ and their exponentials generate a C^* algebra which leaves each subspace $\mathcal{F}_{n1,n2}$ invariant. If a peridoic box cutoff for the fermions is introduced, Uhlenbrock (1967) has shown that this C^* algebra acts irreducibly in each 'sector' $\mathcal{F}_{n1,n2}$. The authors prove this same result without any cutoffs and determine the properties of the representations in each sector. The importance of this result for the problem of constructing fermion fields from 'observables' in two-dimensional models, such as those of Thirring and Schwinger, is discussed. (17 refs.)

99370 Eikonal representation of N-body Coulomb scattering amplitudes. J.M.Fried, K.Kang (Dept. of Phys., Brown Univ., Providence, RI, USA), B.H.J.McKellar.
Phys. Rev. A (USA), vol.28, no.2, p.738-50 (Aug. 1983).
A new technique for the construction of N-body Coulomb scattering amplitudes is proposed, suggested by the simplest case of $N=2$. Calculate the scattering amplitude in eikonal approximation, discard the infinite phase factors which appear upon taking the limit of a Coulomb potential, and treat the remainder as an amplitude whose absolute value squared produces the exact, Coulomb differential cross section. The method easily generalizes to the N-body Coulomb problem for elastic scattering, and for inelastic rearrangement scattering of Coulomb bound states. The authors give explicit results for $N=3$ and 4; in the $N=3$ case they extract amplitudes for the processes $(12)+3\rightarrow 1+2+3$ (breakup), $(12)+3\rightarrow 1+(23)$ (rearrangement), and $(12)+3\rightarrow(12)'+3$ (inelastic scattering) as residues at the appropriate poles in the free-free amplitude. The method produces scattering amplitudes f_N given in terms of explicit quadratures over $(N-2)^2$ distinct integrands. (11 refs.)

12.00 SPECIFIC THEORIES AND INTERACTION MODELS; PARTICLE SYSTEMATICS

Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981 .... See Entry 98660

12.10 UNIFIED FIELD THEORIES AND MODELS

99371 Neutrino oscillations in grand unified theories. K.A.Milton (Oklahoma State Univ., Stillwater, OK, USA).

AIP Conf. Proc. (USA), no.99, p.187-92 (1983). (Neutrino Mass and Gauge Structure of Weak Interactions, Cable, WI, USA, Sept. 1982).

The natural scale of ν_e mixing angles in SO(10) is small, of order $\theta_c/3$. It is possible to achieve large ν_e mixing angles θ, but such solutions are unstable, in the sense that $\alpha\partial\tan\theta/\partial\alpha \sim 100$, where α is a Majorana mass parameter. This difficulty reflects the quark mass hierarchy. On the other hand, ν_μ-ν_τ mixing could naturally be substantial. These qualitative features would be expected to hold any grand unified model where the Gell-Mann-Ramond-Slansky mechanism generates naturally small neutrino masses. (21 refs.)

99372 Minimally extended electroweak gauge theories in SO(10) and E_6. R.W.Robinett (Dept. of Phys., Univ. of Wisconsin, Madison, WI, USA), J.L.Rosner.

AIP Conf. Proc. (USA), no.99, p.193-201 (1983). (Neutrino Mass and Gauge Structure of Weak Interactions, Cable, WI, USA, Sept. 1982).

The possibility of minimally extending the standard $SU(2)_L \times U(1)$ electroweak theory within the context of SO(10) and E_6 grand unification by adding U(1) factors is explored. The neutrino neutral current interactions in these schemes are arranged to coincide with the standard model predictions. Limits on the masses of the extra Z's generated by these U(1) factors are obtained by considering other parity violating effects. Additional Z's as light as 2.5-3.0 times the standard model Z° mass are allowed. (23 refs.)

99373 Second-order fermion masses. C.N.Leung (School of Phys. & Astron., Univ. of Minnesota, Minneapolis, MN, USA), R.W.Robinett, J.L.Rosner.

AIP Conf. Proc. (USA), no.99, p.202-6 (1983). (Neutrino Mass and Gauge Structure of Weak Interactions, Cable, WI, USA, Sept. 1982).

An SO(10) model with the lowest-energy symmetry breaking arising from two members of a 16-plet of Higgs bosons can lead to fermion masses if, in addition to fermion 16-plets, there are heavy fermions belonging to SO(10) singlets. Some consequences of this model for neutrino masses are explored briefly. (13 refs.)

99374 New limits on oscillation parameters for electron antineutrinos. J.-L.Vuilleumier.

AIP Conf. Proc. (USA), no.99, p.252-63 (1983). (Neutrino Mass and Gauge Structure of Weak Interactions, Cable, WI, USA, Sept. 1982).

The positron spectrum from the reaction $\bar{\nu}_e + p \rightarrow e^+ + n$ has been measured at $L = 37.9$ m from the core of the Goesgen power reactor to search for neutrino oscillations of the type $\bar{\nu}_e \rightleftharpoons x$ in the low mass parameter range. The results are consistent with the no oscillation hypothesis. Upper limits of $\Delta^2 < 0.016$ eV^2 (90% C.L.) for full mixing, and $\sin^2 2\theta < 0.17$ (90% C.L.) in the limit of large mass parameters were determined. For the ratio of the integrated experimental yield to that predicted for the case of no oscillations a value of 1.05 ± 0.02 (statistical) ± 0.5 (systematics; 68% C.L.) was obtained. (8 refs.)

99375 Neutrino oscillation experiments at CERN. M.Baldo-Ceolin (Istituto di Fisica, Univ. di Padova, Padova, Italy).

AIP Conf. Proc. (USA), no.99, p.264-71 (1983). (Neutrino Mass and Gauge Structure of Weak Interactions, Cable, WI, USA, Sept. 1982).

A review is given of the three neutrino oscillation experiments which will be started in Spring 1984 at CERN-PS. Their main characteristics are presented. Possible analyses with three oscillation parameters are also discussed. (6 refs.)

99376 Particles, antiparticles, and generalized anomalies in grand unified theories. M.Singer (Dept. of Phys., Simon Fraser Univ., Burnaby, BC, Canada).

Can. J. Phys. (Canada), vol.61, no.8, p.1169-71 (Aug. 1983).

Grand unified theories of strong-weak electromagnetic interactions require both chiral states of all charged fermions to be present so that the theories will have no massless charged particles. For a large class of theories this condition requires not only the absence of all triangle anomalies, but the absence of 'odd-number generalized anomalies' as well. Conversely, the requirement that these theories be odd-number generalized anomaly free guarantees that both chiral states of all charged fermions are present, and thus all charged fermions can acquire mass. (9 refs.)

99377 One possibility of extension of symmetry group of Weinberg-Salam model. I. Formulation of model. S.F.Sultanov.

Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.4, p.58-64 (1982). In Russian.

The extension of the symmetry group of the Weinberg-Salam model up to $SU(2) \times U(1) \times U'(1)$ has been considered. This extension may be connected with the version of lepton charge assignments in which only one additive lepton number having various values for (ν_e, e^-), (ν_μ, μ^-) and (ν_τ, τ^-) was introduced. The part of lagrangian responsible for interaction of photon. $W^\pm$- and Z-bosons coincides with the Weinberg-Salam lagrangian. The model also contains neutral vector boson X having arbitrary mass and interacting with leptonic currents. (9 refs.)

99378 Branching rules and even-dimensional rotation groups SO_{2k}. G.R.E.Black, B.G.Wybourne (Phys. Dept., Univ. of Canterbury, Christchurch, New Zealand).

J. Phys. A (GB), vol.16, no.11, p.2405-21 (1 Aug. 1983).

Unambiguous methods are developed for calculating branching rules for the classical subgroups of the even-dimensional rotation group SO_{2k}. Complete results are given for the subgroups $SU_k \times U_1$, $SO_{2k-2} \times U_1$, $SO_{2p} \times SO_{2q}$ and $SO_{2p+1} \times SO_{2q+1}$. A number of examples relevant to problems in supergravity and unification theories are given. A complete resolution of the antisymmetric powers of the basic spinor irrep of SO_{10} is given and the results extended to SO_{11}. (23 refs.)

99379 Thermodynamic potential of grand unified gauge theories. T.Toimela (Res. Inst. for Theoretical Phys., Univ. of Helsinki, Helsinki, Finland).

J. Phys. G (GB), vol.9, no.8, p.L153-8 (Aug. 1983).

The thermodynamic potential for an arbitrary asymptotically free unified gauge theory is considered at higher temperatures. The calculations are performed up to $O(g^4 \ln g)$. The results are further specialised in an SU(5) model and within this model the equation of state is derived for the matter in the very early universe. (12 refs.)

99380 Three-quark fusion in a proton electromagnetic vertex. R.A.Buchl (Dept. of Phys., Univ. of Petroleum & Minerals, Dhahran, Saudi Arabia), B.P.Nigam.

Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.13, p.465-6 (30 July 1983).

The three-quark fusion process $(3q \rightarrow e^+)$ is used twice to form a proton electromagnetic vertex. According to a grand unified theory an extremely small contribution to the proton electromagnetic vertex is calculated and expressible in terms of the electric form factor as $F_1^{\text{fusion}}(0) \approx 1.1 \times 10^{-62}$. (7 refs.)

99381 Neutrino oscillations with large oscillation length in spite of large (Majorana) neutrino masses?. S.M.Bilenky, B.Pontecorvo (Joint Inst. for Nuclear Res., Moscow, USSR).

Lett. Nuovo Cimento (Italy), vol.37, ser.2, no.13, p.467-71 (30 July 1983).

A model is given in which neutrino oscillations with two Majorana mass eigenstates are entirely similar to $K^0 \rightleftarrows K^0$ oscillations: with a maximum oscillation amplitude, a mass difference $(m_1$-$m_2)$ much less than m_1, m_2, and opposite PC-eigenvalues of the Majorana neutrinos. It is plausible that a realistic situation with more than two Majorana neutrinos could well have similar features. (16 refs.)

99382 Proton lifetime in an $SO(10)$ grand unified theory. T.Matsuki (Nat. Lab. for High Energy Phys., Ibaraki, Japan), N.Yamamoto.

Prog. Theor. Phys. (Japan), vol.69, no.5, p.1505-23 (May 1983).

The mass of lepto-quark gauge boson and the nucleon lifetime are estimated in an $SO(10)$ grand unified theory. The authors use the β-function including the gauge boson mass effects explicitly, and solve renormalization group equation numerically. They also discuss the dependence of results on the various parameters of this theory. (18 refs.)

99383 Comment on 'Upper bounds on the Higgs-Boson mass and the coupling constant'. M.Sher (Dept. of Phys., Univ. of California, Irvine, CA, USA).

Phys. Rev. Lett. (USA), vol.51, no.5, p.434 (1 Aug. 1983).

Recently Uchiyama has claimed (ibid., vol.50, p.946, 1983) that upper bounds on the Higgs mass, m_H, and on the scalar coupling, λ, could be obtained in the Glashow-Weinberg-Salam model by considering scalar-loop corrections to the effective potential. The author points out an error in this analysis which, when corrected, eliminates this bound. (3 refs.)

99384 Finite temperature SUSY GUT phase transitions determined by radiative corrections. J.Kripfganz, H.Perlt (Sektion Phys., Karl-Marx-Univ., Leipzig, Germany).

Phys. Lett. B (Netherlands), vol.127B, no.1-2, p.95-6 (21 July 1983).

Studying the two-loop perturbative contribution to the free energy of grand unified theories a sequence of phase transitions is found, with $SU(3) \times SU(2) \times U(1)$ being the preferred low temperature phase. The transition temperatures are still within the weak coupling regime. (3 refs.)

99385 Next to leading enhancement factor for proton decay in SU_5. M.Daniel (Rutherford & Appleton Lab., Didcot, England), J.A.Penarrocha.

Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.219-23 (28 July 1983).

The authors give a complete calculation within the SU(5) GUT model of the next to leading enhancement factor for nucleon decay due to renormalisation effects arising from hard gluons, W's and B's in processes involving (u,d,e,ν_e). The result is sensitive to the ratios $x_i = M_{H(i)}/M_X$ where $M_{H(i)}$ are the masses of the superheavy Higgs scalars in the 24 multiplet which breaks $SU_5 \rightarrow SU_3 \times SU_2 \times U_1$. (16 refs.)

99386 Mass spectra in SU(5) supersymmetric models of grand unification with Higgs particles in representations 75 or 24. I.G.Koh, J.Patera (Dept. of Phys., Sogang Univ., Seoul, Korea).

Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.224-81 (28 July 1983).

The results of a computation of mass spectra in SUSY models of grand unification in SU(5) are presented. The method uses systematically weight vectors as bases for representation spaces. It is briefly explained on an SU(3) model which, in this formalism, has all technical features occurring in higher groups. General criteria for the choice of Higgs representation are pointed out. (12 refs.)

99387 The DEMON of local SUSY. D.V.Nanopoulos, M.Srednicki (CERN, Geneva, Switzerland).

Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.61-4 (18 Aug. 1983).

The authors discuss the dipole electric moment of the neutron (DEMON) in locally supersymmetric models, with particular attention to axionless theories with $\theta = 0$ at the Planck scale. They find that the DEMON in these theories should be near, but not above, the present experimental upper bound of $\sim 6 \times 10^{-25}$ e cm. (18 refs.)

99388 Algebraic unification. G.Dixon (Dept. of Phys., Brandeis Univ., Waltham, MA, USA).

Phys. Rev. D (USA), vol.28, no.4, p.833-43 (15 Aug. 1983).

A symplectic geometric algebra is proffered as a setting for a strong-weak-electromagnetic unification theory. Four families of leptons and quarks arise and the neutrinos acquire completely chargeless right-handed components and Dirac masses. A single mathematical origin is found for an exact, nonchiral color SU(3) and a broken chiral isospin SU(2). (10 refs.)

99389 Are weak and electromagnetic interactions unified?. N.Dombey (Phys. Div., Univ. of Sussex, Brighton, England).

Surv. High Energy Phys. (Switzerland), vol.3, no.1, p.1-25 (1982).

The standard electroweak model is described, and critically reviewed. An alternative model which is consistent with all known features of the weak interaction but which does not unify it with electromagnetism is presented. (34 refs.)

99390 Radiative corrections to masses in the standard model with two scalar doublets. J.-M.Frere (Faculte des Sci., Univ. Libre de Bruxelles, Bruxelles, Belgium), J.A.M.Vermaseren.

Z. Phys. C (Germany), vol.19, no.1, p.63-7 (1983).

The authors calculate the one loop corrections to the vector boson masses and the ρ parameter in a standard model with two scalar doublets and a complex scalar singlet, the so-called 'superlight axion' model. They find that the deviations from the corrections of the Weinberg-Salam model are practically unobservable when the spectator higgses are very heavy. (9 refs.)

99391 The symmetry breaking pattern $SU(5) \rightarrow SU(3) \times U(1)$ including one loop radiative corrections. C.M.Fraser (Dept. of Theoretical Phys., Univ. of Oxford, Oxford, England), H.Huffel.

Z. Phys. C (Germany), vol.19, no.2, p.101-5 (1983).

The authors derive conditions on the Higgs parameters of the minimal SU(5) model under which the phenomenologically desired symmetry breaking pattern $SU(5) \rightarrow SU(3) \times U(1)$ persists at the one loop level. (10 refs.)

99392 Radiative corrections of $\sin^2 \theta_W{}^{\text{exp}}$ in the SU(5) model. C.Deom, J.Pestieau (Inst. de Phys. Theorique, Univ. Catholique de Louvain, Louvain-la-Neuve, Belgium).

Z. Phys. C (Germany), vol.19, no.2, p.133-5 (1983).

The authors compute perturbatively in the SU(5) grand unification theory the radiative corrections to $\sin^2\theta_W{}^0$ through a phenomenological weak mixing angle, $\sin^2\theta_W{}^{\text{exp}}(q^2)$, defined in the $\nu_\mu e$ elastic scattering. They essentially recover the results obtained by using the renormalization group analysis. (10 refs.)

99393 Unification and grand unification. R.D.Peccei (Werner-Heisenberg-Inst. fur Phys., Max-Planck-Inst. fur Phys. und Astrophys., Munich, Germany).
Proceedings of the 1982 CERN School of Physics (CERN 83-05), Cambridge, England, 5-18 June 1982 (Geneva, Switzerland: CERN 1983), p.187-246
The author reviews the salient features of the standard model of electroweak and strong interactions and considers possible left-right symmetric extensions of this model. The motivations for further unification of the known forces are examined and an introduction is given to grand unified theories. The predictions of the minimal SU(5) model are critically analyzed and a brief discussion is given for some of the extant problems associated with grand unified theories. (75 refs.)

99394 Unification of gauge and gravity interactions from compositeness. G.Veneziano (CERN, Geneva, Switzerland).
Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981, Freiburg, Germany, 31 Aug.-11 Sept. 1981 (New York, USA: Plenum 1983), p.141-58
The author proposes and discusses a theoretical framework in which all gauge symmetries are introduced in the same way, i.e. in terms of fundamental fermionic fields only. Gauge bosons, as well as gravitons, will be composite and their interactions will be automatically unified (and strong) at the same scale, the inverse radius of compositeness. (8 refs.)

99395 Radiative symmetry breaking in grand unified theories. N.Dragon, B.Stech (Inst. fur Theoretische Phys., Univ. Heidelberg, Heidelberg, Germany).
Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981, Freiburg, Germany, 31 Aug.-11 Sept. 1981 (New York, USA: Plenum 1983), p.327-37
Motivated by composite models, the authors start from O(n)-invariant tree potentials for the scalar fields of unified theories and calculate the dynamical symmetry breaking caused by radiative effects. A phenomenologically interesting variety of breaking patterns is obtained. In reducible representations of the scalar fields only the field with the largest Casimir number obtains vacuum expectation values. Right-left symmetric models experience a spontaneous parity breakdown for a range of values of the coupling parameter. (15 refs.)

12.20 MODELS OF ELECTROMAGNETIC INTERACTIONS

99396 Field asymptotic behaviour of a polarization operator. Yu.M.Loskutov, B.A.Lysov, V.V.Skobelev (Moscow State Univ., Moscow, USSR).
Theor. & Math. Phys. (USA), vol.53, no.3, p.1252-5 (Dec. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.3, p.469-73 (Dec. 1982).
In the framework of the two-dimensional approximation of quantum electrodynamics the field asymptotic behaviour of the photon polarization operator in a superstrong magnetic field is analyzed. It is shown that in the region $10^3 \lesssim (B/B)_0 \lesssim 10^4$, $B_0 = m^2/e$, transition toa superstrong field in the individual orders of perturbation theory with subsequent summation over α leads to a nonsingular expression for the photon propagator, i.e. there is no 'zero-charge' problem. (10 refs.)

12.20D Specific calculations and limits of quantum electrodynamics

99397 A quantization of the electromagnetic field. A.Z.Capri, G.Grubl, R.Kobes (Theoretical Phys. Inst., Univ. of Alberta, Edmonton, Alberta, Canada).
Can. J. Phys. (Canada), vol.61, no.8, p.1172-83 (Aug. 1983).
Quantization of the electromagnetic field in a class of covariant gauges is performed on a positive metric Hilbert space. Although losing manifest covariance, the authors find at the free field level the existence of two physical spaces where Poincare transformations are implemented unitarily. This gives rise to two different physical interpretations of the theory. Unitarity of the *S* operator for an interaction with an external source then forces one to postulate that a restricted gauge invariance must hold. This singles out one interpretation, the one where two transverse photons are physical. (11 refs.)

99398 Portraits of the flux tube in QED$_3$: a Monte Carlo simulation with external sources. T.Sterling (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA), J.Greensite.
Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands), vol.B220(FS8), no.3, p.327-50 (25 July 1983).
The authors determine numerically, and display graphically, the electromagnetic energy distribution due to static sources in compact QED$_3$. Using the polymer formulation of the functional integral Monte Carlo simulations are performed with external sources included in the lattice action. Both the Wilson and Villain forms of the action are studied, and the string tension is determined in a small range of weak couplings. For the Villain action, their values for the string tension σ are in agreement with Polyakov's formula. For the Wilson action, they are able to detect a string tension in a range of weak couplings $2.1 \leq \beta \leq 2.3$ below the weak-to-strong coupling cross-over point. In the same range, standard Monte Carlo results for up to 8×8 Wilson loops are consistent with ordinary perturbation theory (no confinement). A possible explanation of this discrepancy is discussed, and it is suggested that the standard (source-free) Monte Carlo might miss configurations which are important for flux-tube formation. (12 refs.)

99399 Aspects of the infrared problem in quantum electrodynamics. K.Kraus (Phys. Inst., Univ. Wurzburg, Wurzburg, Germany).
Found. Phys. (USA), vol.13, no.7, p.701-13 (July 1983).
Scattering states in quantum electrodynamics cannot be represented in Fock space (i.e. as states with finitely many incoming and outgoing free photons), since most collisions involve the emission of infinitely many soft photons. At present, there exist two alternative proposals for an appropriately modified structure of the asymptotic state space of quantum electrodynamics. According to the 'infraparticle' proposal, each charged particle which would be accompanied by an appropriate cloud of infinitely many soft photons, whereas according to the 'infravacuum' proposal these clouds would be replaced by a common soft photon background. The second (less popular) idea is illustrated and motivated here by simple model calculations. (14 refs.)

99400 Finite temperature and density corrections to quantum electrodynamics. J.Z.Kaminski (Inst. of Theoretical Phys., Warsaw Univ., Warsaw, Poland).
J. Phys. A (GB), vol.16, no.11, p.2587-98 (1 Aug. 1983).
The effective Lagrangian and the electric current of quantum electrodynamics at weak electromagnetic field and low temperature is investigated. With the help of the effective Lagrangian the permittivity and permeability are obtained. The effective potential at finite temperature and density induced by the classical Coulomb potential is also obtained. It is shown that the heat corrections modify the Coulomb potential to such an extent that the effective potential adopts the Yukawa form. Some remarks are made about the electron *g* factor at finite temperature and density. (37 refs.)

99401 Conformal quantisation of electrodynamics. G.M.Sotkov, D.T.Stoyanov (Inst. for Nuclear Res. & Nuclear Energy, Sofia, Bulgaria).
J. Phys. A (GB), vol.16, no.12, p.2817-26 (21 Aug. 1983).
A new treatment of Maxwell's equations is proposed. It is shown that these equations can play the role of subsidiary conditions which separate the conformal symmetric solutions of a fixed third-order differential equation. On the basis of this equation a quantisation of Maxwell's equations is constructed such that the conformal symmetry is preserved only in the physical state space. The proposed procedure of conformal quantisation is illustrated by the example of a free electromagnetic field. (10 refs.)

99402 Weakly bound states of an electron in an external electromagnetic field. S.P.Andreev, B.M.Karnakov, V.D.Mur (Moscow Engng. Phys. Inst., Moscow, USSR).
JETP Lett. (USA), vol.37, no.3, p.187-90 (5 Feb. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.3, p.155-7 (5 Feb. 1983).
A model-independent method has been developed for calculating the spectra of weakly bound states of an electron with an arbitrary angular momentum l in an external electromagnetic field. Some results for specific fields are reported. (3 refs.)

99403 Confinement criteria and compact (QED)$_{2+1}$. T.Suzuki, K.Shimada (Dept. of Phys., Kanazawa Univ., Kanazawa, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.5, p.1537-47 (May 1983).
The authors reformulate the Georgi-Glashow model in 2+1 dimensions, namely, compact (QED)$_{2+1}$ following the quantization method developed by Kugo and Ojima. It is shown that the model does not satisfy confinement criteria proposed by Kugo and Ojima, although electrically charged objects are confined in the sense of the area-law behaviour of the Wilson loop. Restoration of residual 'local gauge symmetry' is not realized either. (12 refs.)

99404 The $1/N$ expansion in A U(N)-symmetric SQED in four dimensions. O.Yasdua (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).
Phys. Lett. B (Netherlands), vol.127B, no.1-2, p.97-100 (21 July 1983).
The author investigates the possibility for a spontaneous breakdown of supersymmetry (SUSY) in a supersymmetric QED (SQED) with U(N) supersymmetry in four dimensions by using the 1/N expansion. It is shown that a pathological SUSY breaking does not occur to the leading order of the $1/N$ expansion, as long as the effective potential is real. If the reality condition of the effective potential is removed, however, there appears a pathological SUSY breaking. The difference between this model and the O(N)-symmetric Wess-Zumino model is discussed. (5 refs.)

99405 Infrared coherence and the QED path integral. M.S.Swanson (Dept. of Phys., Univ. of Connecticut, Storrs, CT, USA).
Phys. Rev. D (USA), vol.28, no.4, p.798-807 (15 Aug. 1983).
The infrared coherent states developed by Faddeev and Kulish are used to construct the path-integral representation of quantum electrodynamics. The result shows that the time-ordered products of the asymptotic fields, previously evaluated within the operator formulation, can be derived from the functional formalism. This is accomplished by retaining a nonlocal piece of the original vertex when defining the perturbation series. The resulting path integral allows exact evaluation through a nonperturbative change of spinor variables and the use of the classical solution to the gauge field equation of motion in the presence of a point source moving at constant velocity. Extension of this functional technique to the renormalized theory and to massless nonlinear theories is briefly discussed. (15 refs.)

99406 New method of allowing for the Coulomb interaction in the Logunov-Tavkhelidze quasipotential approach. Yu.N.Tyukhtyaev (Saratov State Univ., Saratov, USSR).
Theor. & Math. Phys. (USA), vol.53, no.3, p.1217-23 (Dec. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.3, p.419-28 (Dec. 1982).
The problem of taking into account Coulomb interactions of ladder type in the investigation of bound states in quantum electrodynamics by the quasipotential method is considered. The basic quasipotential equation and the expression for the quasipotential are written down in terms of two-time positive-frequency Coulomb Green's functions. A corresponding perturbation theory is developed, which makes it possible to calculate the shifts of the energy levels of hydrogen-like atoms to accuracy $\alpha^6 \ln \alpha$. (15 refs.)

12.35 COMPOSITE MODELS OF PARTICLES

99407 Classical chromodynamics, a geometrical approach. F.J.Vanhecke (Univ. Federal do Rio Grande do Norte, Natal, Brazil).
Rev. Bras. Fis. (Brazil), vol.12, no.2, p.343-60 (June 1982).
Wong's equations for point-particles with non-abelian charge interacting with Yang-Mills field, can be derived in a geometrical way without resorting to field theory. Equations of motion for extended objects are derived using the same method. A short discussion of the point-particle case shows the appearance of non-local features in the Yang-Mills-Wong equations. (17 refs.)

12.35C General properties of quantum chromodynamics (dynamics, confinement, etc.)

99408 Restoration of the local gauge symmetry and color confinement in non-abelian gauge theories. II.. H.Hata (Dept. of Phys., Kyoto Univ., Kyoto, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.5, p.1524-36 (May 1983).
For pt.I see ibid., vol.67, p.1607 (1982). The author considers in the covariantly gauge-fixed continuum theory of QCD formulated by the Euclidean path integral a specific local gauge symmetry transformation which changes the boundary condition of the gauge fields. This local gauge symmetry is spontaneously broken in perturbation theory. The author shows that if this symmetry is restored dynamically, then the total confinement of color is realized. The restoration condition is found to coincide with the color confinement condition proposed earlier by Kugo and Ojima. The correspondence with the symmetry restoration in the non-linear σ-models in two dimensions and the relation with our previous indirect approach are also discussed. (17 refs.)

99409 Technicolor gymnastics. S.Dimopoulos, H.Georgi, S.Raby (Dept. of Phys., Stanford Univ., Stanford, CA, USA).
Phys. Lett. B (Netherlands), vol.127B, no.1-2, p.101-5 (21 July 1983).
The authors propose a Glashow-Iliopoulos-Maiani mechanism for extended technicolor theories and illustrate it in an explicit model. They find that flavor changing neutral current effects are adequately suppressed if $m_t \ll 50$ GeV. (1 ref.)

99410 The self-energy of a heavy quark in the gluonic vacuum and the effective mass. W.Ishizuka, Y.Kikuchi (Dept. of Phys., Tohoku Univ., Sendai, Japan).
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.251-3 (28 July 1983).
The authors calculate, by use of the multipole expansion, the self-energy of the heavy quark in the gluonic vacuum from which the momentum dependent effective mass is derived. A phenomenological consequence is also discussed. (13 refs.)

99411 Universal signals of a quark-gluon plasma. B.Sinha (Nuclear Phys. Div., Bhabha Atomic Res. Centre, Bombay, India).
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.91-4 (18 Aug. 1983).
It is shown that the ratio of the production rates $(\gamma/\mu^+\mu^-)$ and $(\pi^{0,\pm}/\mu^+\mu^-)$ from a quark-gluon plasma is independent of the space-time evolution of the plasma fireball and thus universal signals of the quark phase. (15 refs.)

99412 Self-consistency correlations between QCD parameters from e^+e^- annihilation. C.Verzegnassi (Phys. Div., Univ. of Sussex, Brighton, England).
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.101-6 (18 Aug. 1983).
The author proposes a method to generate correlations between QCD parameters using the available e^+e^- data. The method reproduces 'standard' results, but needs a rather large strange quark 'mass' $\bar{m}_s \gtrsim 250$ MeV assuming 'standard' values for the non perturbative parameters. (12 refs.)

99413 Anomalous-dimension matrices for four-quark operators. R.D.C.Miller, B.H.J.McKellar (School of Phys., Univ. of Melbourne, Parkville, Victoria, Australia).
Phys. Rev. D (USA), vol.28, no.4, p.844-55 (15 Aug. 1983).
The authors present one-loop calculations of anomalous-dimension matrices γ for four-quark operators. Flavor-space indexing determines the nature of γ. Four important possibilities are considered for operators with left-left, left-right, and right-right chiral structures. (10 refs.)

99414 Asymptotic behavior of the fixed-angle on-shell quark scattering amplitudes in non-Abelian gauge theories. A.Sen (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
Phys. Rev. D (USA), vol.28, no.4, p.860-75 (15 Aug. 1983).
In this paper the author finds the asymptotic behavior of the fixed-angle on-shell quark-quark scattering amplitude in non-Abelian gauge theories in the limit of very large center-of-mass energy $\sqrt{s}$. He sums the perturbation series to all orders in the coupling constant and all powers of $\ln s$, but ignores terms which are suppressed by a power of s order by order in perturbation theory. In the $s \to \infty$ limit the amplitude vanishes as $\exp(-\alpha \ln s \ln s)$, where α is a constant. The phase of the amplitude is shown to be free from infrared divergences. Hence the phase is a perturbatively calculable function and may provide important tests of QCD. (12 refs.)

99415 Quantum chromodynamics: theory and experiment. J.F.Owens (Phys. Dept., Florida State Univ., Tallahassee, FL, USA).
Surv. High Energy Phys. (Switzerland), vol.3, no.2, p.65-96 (1982).
For more than a decade a substantial fraction of the high energy experimental program has been devoted to the gathering of data which are sensitive to the short distance behavior of the strong interaction. During the same time period a theory of the strong interaction, quantum chromodynamics (QCD), has been developed. The use of perturbation theory techniques allows some definite predictions to be made which can be tested by such data. This review is intended to give an overview of the program of testing QCD in large momentum transfer processes. For each example considered, the sensitivities of the proposed tests will be discussed and various technical difficulties will be outlined. (73 refs.)

99416 Colored scalars and new hadrons. A.Yu.Ignat'ev, V.A.Matveev, A.N.Tavkhelidze, K.G.Chetyrkin, M.E.Shaposhnikov (Inst. of Nuclear Res., Acad. of Sci., Kiev, Ukrainian SSR).
Theor. & Math. Phys. (USA), vol.53, no.2, p.1063-7 (Nov. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.2, p.181-7 (Nov. 1982).
It is shown that the introduction of light scalar quarks into quantum chromodynamics leads to the appearance of a new family of hadronic states with physical properties qualitatively different from the known mesons and baryons. The characteristic mass scale of the new hadrons is tens of GeV. It is possible that these states lie in an energy region already accessible to the existing accelerators. (17 refs.)

99417 Fundamentals of QCD. J.C.Taylor (Dept. of Appl. Math. & Theoretical Phys., Univ. of Cambridge, Cambridge, England).
Proceedings of the 1982 CERN School of Physics (CERN 83-05), Cambridge, England, 5-18 June 1982 (Geneva, Switzerland: CERN 1983), p.103-44
The author presents the Lagrangian density for quarks and their interaction with the gluon field, and discusses its form, a further term is then added to describe the gluons and their self-interaction. The Feynman rules for QCD are presented, and these are used in a discussion of Ward identities, unitary and virtual ghosts, dimensional regularisation, and coupling constant renormalisation. (no refs.)

12.35E Applications of quantum chromodynamics to particle properties and reactions

99418 A deformable bag model of hadrons. I.. H.Ui, K.Saito (Dept. of Phys., Tohoku Univ., Sendai, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.5, p.1467-83 (May 1983).
As a generalization of the MIT spherical bag model the authors construct the spheroidal bag model of hadron with an arbitrary eccentricity. This generalization is made by slightly modifying the MIT linear boundary condition: The model always satisfies two necessary requirements of the MIT bag model—i.e. $\mathbf{n}.\mathbf{j}=0$, no quark colour flux leaves the bag, and $\bar{q}q=0$, the scalar density of quark should vanish on the bag surface—and it reduces to the MIT spherical bag model in the limit of zero-eccentricity. Lagrangian formalism of the model is briefly described. The eigenfrequencies of a single massless quark confined in this spheroidal bag are numerically calculated. They obtain the level-splitting of the excited quark orbits, which is analogous to the well-known Nilsson's splitting of single particle orbits in deformed nuclei. By using the numerical results of the lowest orbit, the effect of the bag-deformation on the mass of low-lying hadrons is estimated. It is found that, although the spherical bag is stable, the quark bag is extremely soft against the quadrupole deformation. (10 refs.)

99419 Higgs boson production in high energy lepton-nucleon scattering. Z.Hioki, S.Midorikawa, H.Nishiura (Res. Inst. for Fundamental Phys., Kyoto Univ., Kyoto, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.5, p.1484-97 (May 1983).
Higgs boson productions are studied in high energy $\nu(\bar{\nu})N$ and $l^\pm N$ scatterings. Total cross-sections are calculated at the lowest order of perturbation by taking into account two kinds of mechanisms, i.e., bremsstrahlungs from (I) strange-and charm-quark and from (II) $W^\pm$, Z boson, and detailed numerical results are presented in the framework of QCD improved parton model. In νN process, it is shown that the contribution of the mechanism (II) is dominant for an extensive range of the energy although that of the mechanism (I) increases rapidly with energy. On the contrary, both mechanisms give comparable contributions in $l^\pm N$ processes. The total cross-sections are found to be rather small for both reactions even at very high energy. (13 refs.)

99420 On the nucleon residues into quark currents. V.M.Belyaev (Inst. of Theoretical & Experimental Phys., Moscow, USSR).
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.254-6 (28 July 1983).
The amplitudes of the virtual transition of a nucleon into quark currents are discussed. The amplitude which determines the proton life time in SUSY grand unified models is found using the QCD sum rules method. (9 refs.)

99421 Light cone expansion and scaling laws for radiative orthoquarkonium decays. J.H.Kuhn (Inst. fur Theoretische Phys., RWTH Aachen, Aachen, Germany).
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.257-61 (28 July 1983).
In the framework of perturbative QCD scaling laws are derived for the decay of a heavy orthoquarkonium state into a photon and a light pseudoscalar.

From the leading term in the light cone expansion a ratio of decay widths $\Gamma({}^3S_1 \rightarrow \gamma + \text{light meson})/\Gamma({}^3S_1 \rightarrow e^+e^-)$ is obtained which decreases with the square of the mass of the heavy meson. Predictions for the rates of radiative ψ and Υ decays are given and the extension of these results to 0^{++}, 1^{++} and 2^{++} states is discussed. (10 refs.)

99422 What do the data for the Υ family say about $\langle 0|(\alpha_s/\pi)G^a_{\mu\nu}G^a_{\mu\nu}|0\rangle$?. L.J.Reinders (CERN, Geneva, Switzerland).
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.262-4 (28 July 1983).
The author shows that the data on ${}^3S_1$ upsilonium are consistent with the standard value for the gluon condensate parameter $\langle 0|(\alpha_s/\pi)G^a_{\mu\nu}G^a_{\mu\nu}|0\rangle$ contrary to a claim recently made by Zalewska and Zalewski (1983). (3 refs.)

99423 Fine and hyperfine structures of heavy quarkonia and perturbative quantum chromodynamics. J.Morishita, M.Oka (Graduate School of Sci. & Technol., Kobe Univ., Kobe, Japan), M.Kaburagi, H.Munakata, T.Kitazoe.
Z. Phys. C (Germany), vol.19, no.2, p.167-78 (1983).
Spectroscopies of the heavy quarkonia, $c\bar{c}$, $b\bar{b}$ and $t\bar{t}$, are analysed with a potential model. Relativistic effects are taken into account and spin dependent interactions are investigated in detail. The authors propose a flavor independent potential which has a Lorentz vector term determined by the perturbative QCD at short distances and a Lorentz scalar term confining quarks at large distances. It is stressed that the short range attenuation of the vector Coulomb potential has significant effects on the fine and hyperfine structures of the $c\bar{c}$ and $b\bar{b}$ systems, and also on the $t\bar{t}$ level structure. They study the decay property of the $t\bar{t}$ system, using the calculated wave functions. (22 refs.)

99424 Applications of QCD. P.V.Landshoff (Dept. of Appl. Math. & Theoretical Phys., Univ. of Cambridge, Cambridge, England).
Proceedings of the 1982 CERN School of Physics (CERN 83-05), Cambridge, England, 5-18 June 1982 (Geneva, Switzerland: CERN 1983), p.145-86
The author discusses deep inelastic scattering ($lN \rightarrow l'X$) and how it is analysed through the parton model. The Drell-Yan mechanism, e^+e^- annihilation, and photon-photon collisions are also discussed in the parton framework. How the parton model is modified by QCD effects is then considered. QCD perturbation theory is applied to wide-angle quark-quark scattering; higher order terms are discussed. (17 refs.)

12.35H Phenomenological composite models of particle structure and reactions (partons, bags, etc.)

99425 Growth of total cross sections and the quark structure of hadrons. S.M.Roshin, N.E.Tyurin (Inst. of High-Energy Phys., USSR).
JETP Lett. (USA), vol.37, no.2, p.139-42 (20 Jan. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.2, p.113-15 (20 Jan. 1983).
The authors have derived the dependence of the cross sections on parameters related to the hadron structure: the number and masses of the valence quarks. The dependence of the cross sections on the quark masses explains the difference in the magnitudes of the cross sections on the basis of different quark compositions of the hadrons. The limitation on the growth of the total interaction cross sections found from the general principles of field theory suggests that the mass of the $u(d)$ quark must have a lower limit of the π-meson mass. (6 refs.)

99426 Chiral invariance in the soliton bag model. R.Goldflam (Dept. of Phys., Univ. of Washington, Seattle, WA, USA), I.Duck, E.Umland.
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.155-6 (28 July 1983).
The soliton bag model of quark confinement is shown to give the same pionic coupling as the cloudy bag model, explicitly independent of details of the soliton field. The Goldberger-Treiman relation is satisfied in this development. (7 refs.)

99427 Are there baryons with constituent glue?. C.E.Carlson (Dept. of Phys., State Univ. of New York, Stony Brook, NY, USA), T.H.Hansson.
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.95-8 (18 Aug. 1983).
The authors point out that Λ-like baryons with a constituent gluon can be light because of large color electromagnetic attractions. Mass estimates from the MIT bag model suggest that some observed baryons may be (qqqg) states. (14 refs.)

99428 Is there need for baryons with constituent glue?. U.G.Meissner (Phys. Dept., State Univ. of New York, Stony Brook, NY, USA).
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.99-100 (18 Aug. 1983).
The author investigates the breathing-mode spectrum of the Λ-particle in the framework of a general bag model including confinement via surface tension and volume energy. It is shown that the experimental states Λ 1/2 (1600) and Λ 1/2 (1800) can be described as radial surface excitations of the Λ. He further comments on a recent paper describing these Λ-excitations as baryons with constituent glue. (12 refs.)

99429 On an inverse method in one dimension. P.Asthana, A.N.Kamal (Dept. of Phys., Univ. of Alberta, Edmonton, Alberta, Canada).
Z. Phys. C (Germany), vol.19, no.1, p.37-52 (1983).
Given a sequence of bound-state energies the inverse Gel'fand-Levitan theory for the one-dimensional Schrodinger equation enables one to construct uniquely a symmetric reflectionless potential which supports those bound states. The authors test the reliability of this technique by applying it to some known symmetric potentials (confining and nonconfining) in one dimension. They also study the systematics under which the method may be reliable. (16 refs.)

99430 Dynamical correlations in the dual parton model. F.W.Bopp (Dept. of Phys., Siegen Univ., Siegen, Germany).
Z. Phys. C (Germany), vol.19, no.2, p.137-42 (1983).
The effect of multiple 'chain' contributions to particle production, which appears in the Dual Parton Model at collider energies, is investigated in an exploratory model, in which other sources of correlations are largely neglected. Attention is given to the question of KNO scaling for the multiplicities observed in restricted or unrestricted rapidity ranges. The rapidity distribution associated with a fixed number of particles within a suitably chosen interval is found to be sensitive to details of the mechanism of multiple chain production. (18 refs.)

99431 Quark masses in a BCS-like approach using $Q\bar{Q}$ potentials. A.Datta (Dept. of Phys., Jadavpur Univ., Calcutta, India), J.Dey, M.Dey, P.Ghose.
Z. Phys. C (Germany), vol.19, no.2, p.179-87 (1983).
Using a BCS like equation the authors have computed constituent quark masses as a function of a parameter C. This parameter is a measure of the effective strength of the interaction for off-the-mass-shell, localised $q\bar{q}$ pairs and is given by $C=R/E$, where E is the energy required to separate the pair to a distance R. Several phenomenological flavour independent $q\bar{q}$ potentials and correlation functions yield results similar in nature. Predictions for distribution functions of intrinsic sea quarks have been made. (14 refs.)

12.35K Other composite models

(inc. composite quarks and leptons)

99432 Dual preon models. I. The SU(7)×SU(7) model. M.Ida (Dept. of Phys., Kobe Univ., Kobe, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.5, p.1554-68 (May 1983).
The dual preon model with a quasi-simple gauge group $G=SU_{hc}(7)\otimes SU_{ht}(7)$ is studied. It automatically has a global symmetry $U_x(1)$ of Peccei and Quinn, with an invisible composite axion. The group for the anomaly condition is taken to be the symmetry group at preon confinement, which is further enlarged to a classification group of massless composite fermions. By taking it to be $SU(5)\otimes U_x(1)$, four generations of $\mathbf{5}^*\oplus\mathbf{10}$ are obtained. Numerical estimates of some scales of the model are also given. (17 refs.)

99433 Dual preon models. II. The SO(10)⊗SO(10) model. M.Ida (Dept. of Phys., Kobe Univ., Kobe, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.5, p.1569-79 (May 1983).
For pt.I, see ibid., vol.69, no.5, p.1554-58 (1983). The dual preon model with a quasi-simple guage group of $G=SO(10)\otimes SO(10)$ is studied. A global symmetry $U_x(1)$ required by a dual pair of preon multiplets can be used to determine the number of generations, though it may break above the scale Λ_{hc} of preon confinement. At Λ_{hc} six generations of 16s with preon configuration mixing are obtained for quarks and leptons. An invisible composite axion emerges by spontaneous breaking of $U_x(1)$ and QCD effects. (10 refs.)

99434 Family gauge symmetry from a composite model. Bang-Rong.Zhou (Fermi Nat. Accelerator Lab., Batavia, IL, USA), Chao-Hsi.Chang.
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.209-14 (28 July 1983).
A family gauge symmetry $SU^F(2)$ could emerge from a composite model of quarks and leptons under some assumptions of chiral hyperflavour symmetry-breaking pattern. Possible dynamical mechanisms which break the family and electroweak gauge group and produce quark-lepton masses are indicated and their phenomenologies are discussed qualitatively. (23 refs.)

99435 Weak interaction symmetry and generation structure in the quasi-Nambu-Goldstone fermion picture of quarks and leptons. O.W.Greenberg, R.N.Mohapatra, M.Yasue (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA).
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.65-8 (18 Aug. 1983).
The authors discuss composite models where massless quarks and leptons arise as superpartners of composite Goldstone bosons, resulting from the spontaneous breakdown of global symmetry, in a supersymmetric theory in which the preons are confined by nonabelian hypercolor dynamics. They present different schemes for including the generations. Finally, they note some problems with this approach. (8 refs.)

99436 An introduction to the possible substructure of quarks and leptons. L.Lyons (Nuclear Phys. Lab., Univ. of Oxford, Oxford, England).
Prog. Part. & Nucl. Phys. (GB), vol.10, p.227-304 (1983).
After an introductory discussion of the history of substructure and of the motivations for examining the possible compositeness of quarks and leptons, experiments which could be relevant to the non-point-like nature of these fermions are reviewed. Where possible the data are used to deduce limits on the substructure energy scale. Starting with very early ideas about quark and lepton substructure, the author goes on to summarise some of the specific models which have recently been proposed. They are very varied, but a general discussion is given about common topics which such models consider (e.g. the nature of the binding mechanism, the problem of the masses of the

composite systems, the way in which fermion generations arise, whether to make weak intermediate bosons composite, etc.). In considering individual models, emphasis is placed on what specific predictions can be tested experimentally. The author concludes that experiments in the near future could significantly increase the energy range in which substructure can be probed. This may then provide a more realistic basis on which the judge whether quarks and leptons are composite. (288 refs.)

12.40E Statistical models

99437 Large P_T spectrum as a possible signal for quark matter formation. S.Kagiyama, T.Hirose (Dept. of Phys., Kagoshima Univ., Kagoshima, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.5, p.1457-66 (May 1983).
Assuming the quark-gluon plasma formation in high energy $pp(p\bar{p})$ collisions, the temperature of the plasma is calculated on the basis of the statistical quark bag model. The temperature is shown to agree well with the effective temperature estimated from the medium p_t data at ISR and SPS energies. (41 refs.)

99438 The exact q$\bar{q}$ potential in Nambu string theory. J.F.Arvis (Lab. de Phys. Theorique Ecole Normal Superieure, Paris, France).
Phys. Lett. B (Netherlands), vol.127B, no.1-2, p.106-8 (21 July 1983).
The Nambu string model with fixed ends is solved exactly. The corresponding static potential is found to be: $V(R)=[R^2/(2\pi\alpha')^2-(D-2)/24\alpha']^{1/2}$. Rotational invariance checks imply the space-time dimension $D=26$. (6 refs.)

99439 Reggeon calculus at collider energies. C.Pajares, A.Varias, P.Yepes (Dept. de Fisica Teorica, Univ. de Santiago, Santiago de Compostela, Spain).
Z. Phys. C (Germany), vol.19, no.1, p.89-93 (1983).
The phenomenology of the perturbative reggeon calculus at collider energies is studied. It is found that the graphs which were neglected at ISR energies are still negligible at $\sqrt{s}=540$ GeV. The perturbative series for the total cross section still converges reasonably fast. The values of the different parameters which describe rightly the data up to ISR energies give rise to a total cross section of around 60 mb at $\sqrt{s}=540$ GeV. For these values, the corresponding low mass and high mass eikonal series converges much more slowly. The nonperturbative reggeon calculus gives rise to a total cross section less than 60 mb. (19 refs.)

12.40V Vector-meson dominance

99440 Tensor meson dominance and e^+e^--physics. H.Genz (Center for Theoretical Studies, Univ. of Miami, Coral Gables, FL, USA), S.Mallik.
Fortschr. Phys. (Germany), vol.31, no.5, p.297-311 (1983).
The authors report on the phenomenological status of tensor meson dominance. Some new results, mainly concerning hadronic decays of the 2^{++}-meson $\chi_2(3.55)$ and the heavy lepton τ are also included. Considering experimental errors, they find agreement of tensor meson dominance with experiment. (22 refs.)

12.70 HADRON MASS FORMULAS

99441 An ISU(3) hadron mass formula. Z.Perjes (Central Res. Inst. for Phys., Budapest, Hungary), G.A.J.Sparling.
Surv. High Energy Phys. (Switzerland), vol.3, no.1, p.27-36 (1982).
A universal mass expression is derived for non-charm hadrons which unites GMO formulae for various multiplets. Mass splitting is achieved via the generators of the 14-parameter ISU(3) group. The spectrum depends on three parameters which vary with the spin. Comparison with particle data shows a nearly linear dependence. (9 refs.)

99442 Light and heavy hadron masses in a relativistic quark potential model with diquark clustering. D.B.Lichtenberg, W.Namgung, J.G.Wills (Dept. of Phys., Indiana Univ., Bloomington, IN, USA), E.Predazzi.
Z. Phys. C (Germany), vol.19, no.1, p.19-27 (1983).
Meson masses are calculated in the quark model with a phenomenological spin-dependent potential of form motivated by QCD. For comparison, the potential is used in two different wave equations, both of which incorporate the feature of relativistic two-body kinematics. The masses of light and heavy pseudoscalar and vector mesons are calculated in the model with only a small number of adjustable parameters, and good qualitative agreement with experiment is obtained. The masses of diquarks are calculated without any additional parameters, using the same potential as for mesons except for a QCD color factor. Then baryon masses are calculated, also without additional parameters, in an approximation in which a baryon is a composite of a quark and a diquark. Again the results are in good qualitative agreement with experiment. Both wave equations yield similar solutions, although there are differences in detail. One distinctive feature of the model is that quark current masses are used as input, and effective constituent quark masses are obtained as a result of the calculation. (40 refs.)

99443 Mass splitting of the pseudoscalar mesons by Monte Carlo technique. P.Di Vecchia (Phys. Dept., Univ. of Wuppertal, Wuppertal, Germany).
Structural Elements in Particle Physics and Statistical Mechanics. Proceedings of the NATO Advanced Summer Institute on Theoretical Physics 1981, Freiburg, Germany, 31 Aug.-11 Sept. 1981 (New York, USA: Plenum 1983), p.317-26
In the last couple of years it has been shown that a long standing problem of hadron physics, that goes under the name of the $U_A(1)$ problem, can be explicitly solved in large N QCD. The result of this analysis is summarized by the effective Lagrangian for the nonet of the pseudoscalar mesons. The resolution of the $U_A(1)$ problem as well as the successful description of the dynamics of the pseudoscalar mesons can be reduced to explain why $A\neq0$ in the quarkless theory, although it vanishes in perturbation theory. The most promising non-perturbative way to compute A is by using the lattice gauge theory. The author discusses a recent attempt to extract A with the Monte Carlo technique in the case of a SU(2) lattice guage theory. (8 refs.)

13.15 NEUTRINO INTERACTIONS

(inc. interactions involving cosmic rays)

99444 Neutrino experiment involving inverse beta decay at a nuclear reactor. A.I.Afonin, S.A.Bogatov, A.A.Borovoi, A.G.Veshinskii, S.L.Gavrilov, S.N.Ketov, Yu.V.Klimov, V.I.Kopeikin, L.A.Levina, L.A.Mikaelyan, K.V.Ozerov, V.V.Sinev, A.N.Kheruvimov (I.V. Kurchatov Inst. of Atomic Energy, Moscow, USSR).
JETP Lett. (USA), vol.37, no.2, p.150-3 (20 Jan. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.2, p.122-4 (20 Jan. 1983).
An experiment of the reaction $\bar{\nu}_e+p\rightarrow n+^+$ is being started at an underground neutrino laboratory at a nuclear power plant. Some preliminary data on the cross section are reported. The question of searching for Pontekorvo oscillations in reactor experiments is discussed. (13 refs.)

99445 Measurement of the rate of increase of neutrino cross sections with energy. R.Blair, B.Barish, Y.K.Chu, B.Jin, D.MacFarlane, R.L.Messner, J.Lee, J.Ludwig, D.B.Novikoff, M.V.Purohit (California Inst. of Technol., Pasadena, CA, USA), P.S.Auchincloss, F.Sciulli, M.H.Shaevitz, F.Bartlett, D.Edwards, H.Edwards, H.E.Fisk, Y.Fukushima, Q.A.Kerns, T.Kondo, P.A.Rapidis, S.L.Segler, R.J.Stefanski, D.Theriot, D.Yovanovitch, A.Bodek, R.Coleman, W.Marsh, O.Fackler, K.A.Jenkins.
Phys. Rev. Lett. (USA), vol.51, no.5, p.343-6 (1 Aug. 1983).
The energy dependence of the cross section for neutrino- and antineutrino-nucleon charged-current interactions has been determined from data in Fermilab's dichromatic neutrino beam. $\sigma^\nu/E=(0.669\pm0.003\pm0.024)\times10^{-38}$ cm^2/GeV and $\Sigma^{\bar{\nu}}/E=(0.340\pm0.003\pm0.02)\times10^{-38}$ cm^2/GeV are found. These results are higher than some previous measurements. (16 refs.)

99446 Experimental study of x-distributions in semileptonic neutral-current neutrino reactions. M.Jonker, F.Udo (NIKHEF, Amsterdam, Netherlands), J.V.Allaby, U.Amaldi, G.Barbiellini, A.Capone, W.Flegel, W.Kozanecki, K.H.Mess, M.Metcalf, J.Meyer, R.S.Orr, J.Panman, A.M.Wetherell, K.Winter, V.Blobel, F.W.Busser, P.D.Gall, H.Grote, B.Kroger, E.Metz, F.Niebergall, K.H.Ranitzsch, P.Stahelin, P.Gorbunov, E.Grigoriev, V.Kaftanov, V.Khovansky, A.Rozanov, A.Baroncelli, B.Borgia, C.Bosio, F.Ferroni, E.Longo, P.Monacelli, F.de Notaristefani, P.Pistilli, C.Santoni, V.Valente.
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.117-23 (18 Aug. 1983).
Neutral-current differential cross sections as a function of the scaling variable x for deep inelastic neutrino-nucleon and antineutrino-nucleon scattering on an isoscalar target were measured in the CERN SPS 200 GeV/c Narrow-Band Beam with the CHARM fine-grained calorimeter. The data have been corrected for the experimental resolutions using a novel unfolding procedure. Its validity is tested on charged-current reactions. The x-distributions deter-

mined in neutral-current reactions are found to be compatible with the results obtained in charged-current reactions, as expected by the quark model of the nucleon and by the standard model of the weak interactions. (12 refs.)

13.20 LEPTONIC AND SEMILEPTONIC DECAYS OF MESONS

99447 Search of *CP* violation in the $K^0 \rightarrow 3\pi^0$ decay. V.V.Barmin, V.G.Barylov, T.A.Chistykova, I.V.Chuvilo, G.V.Davidenko, V.S.Demidov, A.G.Dolgolenko, V.A.Ergakov, V.N.Golubchikov, A.G.Meshkovsky, G.S.Mirosidi, V.I.Moskalev, V.A.Shebanov, N.N.Shishov, Yu.V.Trebukhovsky, N.K.Zombkovskaya (Inst. for Theoretical & Experimental Phys., Moscow, USSR), M.Baldo-Ceolin, E.Calimani, S.Ciampolillo, F.Mattioli, G.Miari, A.Sconza.
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.129-32 (18 Aug. 1983).
Out of a total of 1.8×10^6 photographs of the 180 liter xenon bubble chamber exposed to a K^+ beam with 0.85 GeV/c momentum, 632 identified $K^0 \rightarrow 3\pi^0$ decays were selected. The ratio of the *CP* violating to the *CP* conserving amplitudes $\eta_{000} = A(K_S{}^0 \rightarrow 3\pi^0)/A(K_L{}^0 \rightarrow 3\pi^0) = (-0.08 \pm 0.18) + i(-0.05 \pm 0.27)$ was obtained. This result is compatible within one standard deviation with the value $\eta_{000} = 0$ and is independent of any assumption about *CPT* invariance. Assuming *CPT* invariance and $\Delta I < 5/2$ the authors obtained $|\eta_{000}|^2 < 0.1$ at the 90% CL. The corresponding upper limit for $\Gamma(K_S{}^0 \rightarrow 3\pi^0)/\Gamma(K_S{}^0)$ is 0.37×10^{-4}. (8 refs.)

99448 On the hadronic production of lepton pairs from heavy flavour decay. H.G.Fischer, W.M.Geist (CERN, Geneva, Switzerland).
Z. Phys. C (Germany), vol.19, no.2, p.159-66 (1983).
The production of dilepton states by semileptonic decay of charm-anticharm and beauty-antibeauty meson pairs is studied for proton-proton collisions. It is shown that the measured features of dilepton production can be well described by this nonelectromagnetic process up to masses of at least 5 GeV. Upper limits for hadronic heavy flavour production are derived. (19 refs.)

13.25 HADRONIC DECAYS OF MESONS

99449 D^0 spectrum from *B*-meson decay. J.Green, R.G.Hicks, F.Sannes, P.Skubic, A.Snyder, R.Stone (Rutgers Univ., New Brunswick, NJ, USA), A.Chen, M.Goldberg, N.Horwitz, A.Jawahery, M.Jibaly, P.Lipari, G.C.Moneti, C.G.Trahern, H.Van Hecke, M.S.Alam, S.E.Csorna, L.Garren, M.D.Mestayer, R.S.Panvini, R.Xia Yi Giles, J.Hassard, M.Hempstead, K.Kinoshita, W.W.Mackay, F.M.Pipkin, R.Wilson, H.Kagan, D.Andrews, P.Avery, C.Bebek, K.Berkelman, D.G.Cassel, J.W.DeWire, R.Ehrlich, T.Ferguson, R.Galik, M.G.D.Gilchriese, B.Gittelman, M.Halling, D.L.Hartill, D.Herrup, S.Holzner, M.Ito, J.Kandaswamy, V.Kistiakowsky, D.L.Kreinick, Y.Kubota, N.B.Mistry, F.Morrow, E.Nordberg, M.Ogg, R.Perchonok, R.Plunkett, A.Silverman, P.C.Stein, S.Stone, D.Weber, R.Wilcke, A.J.Sadoff, S.Behrends, K.Chadwick, J.Chauveau, P.Ganci, T.Gentile, J.M.Guida, J.A.Guida, R.Kass, A.C.Melissinos, S.L.Olsen, G.Parkhurst, D.Peterson, R.Poling, C.Rosenfeld, G.Rucinski, E.H.Thorndike.
Phys. Rev. Lett. (USA), vol.51, no.5, p.347-50 (1 Aug. 1983).
The inclusive branching fraction for *B*-meson decay into D^0 mesons and the momentum spectrum of the D^0's have been measured. $0.8 \pm 0.2 \pm 0.2$ D^0 per *B* decay was found. The shape of the spectrum suggests an interesting picture of *B*-meson decay. (9 refs.)

99450 ϵ'/ϵ and $\Delta I = 1/2$ matrix element enhancement. P.Ginsparg (Lyman Lab. of Phys., Harvard Univ., Cambridge, MA, USA), M.B.Wise.
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.265-9 (28 July 1983).
The authors derive a lower bound on $|c_2 s_2 s_3 s_\delta|$ as a function of the B meson lifetime and the top quark mass. The quantity $c_2 s_2 s_3 s_\delta$ relates a certain $\Delta I = 1/2$ matrix element to ϵ'/ϵ. Their bound can be useful in determining the explanation for the enhancement of $\Delta I = 1/2$ matrix elements in nonleptonic kaon and hyperon decays. (16 refs.)

13.30 DECAYS OF BARYONS

99451 Determination of G_A/G_V from the set of three angular-correlation coefficients observed in the decay of the free neutron. Yu.A.Mostovoi (I.V. Kurchatov Inst. of Atomic Energy, Moscow, USSR).
JETP Lett. (USA), vol.37, no.3, p.196-7 (5 Feb. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.3, p.162-3 (5 Feb. 1983).
An equation relating $\lambda = G_A/G_V$ to the three angular-correlation coefficients yields the value $\lambda = -1.226 \pm 0.042$. The indicated error is determined entirely by the error in the measurements of the antineutrino-spin correlation. This quantity may thus be regarded as the result of a new measurement of λ, the first based on this correlation. (5 refs.)

99452 An explicit spin-isospin dependence of the nucleon partial decay amplitudes. C.S.Warke (Tata Inst. of Fundamental Res., Bombay, India).
J. Phys. G (GB), vol.9, no.8, p.L159-63 (Aug. 1983).
The general spin-isospin dependence of the nucleon partial decay amplitude and the corresponding width are derived. The effects of spin-flavour SU(6) symmetry breaking and the quark correlations on the nucleon lifetime are studied. Keeping the same baryon spectroscopic data, the calculated proton decay partial lifetime varies from $T(p \rightarrow e^+\pi^0) = 1.14$ to 2.02×10^{31} yr for $M_x = 4.2 \times 10^{14}$ GeV. (23 refs.)

99453 More about proton decay due to $d=5$ operators. V.M.Belyaev, M.I.Vysotsky (Inst. of Theoretical & Experimental Phys., Moscow, USSR).
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.215-18 (28 July 1983).
The authors demonstrate that gluino exchange does not lead to proton decay through $d=5$ operators: the sum of the corresponding Feynman diagrams equals zero. The experimental bound for the proton life time leads to the following constraints for the W-bozino Majorana mass: $M_{\tilde{W}} < 1$ GeV or $M_{\tilde{W}} > 10^3$ TeV. These constraints must be taken into account in constructing realistic SUSY grand unified models. (12 refs.)

13.35 DECAYS OF LEPTONS

99454 τ branching ratios and polarization limits in e^+e^- interactions at $\sqrt{s} = 34$ GeV. H.J.Behrend, Ch.Chen, H.Fenner, U.Gumpel, M.-J.Schachter, V.Schroder, H.Sindt (DESY, Hamburg, Germany), G.D'Agostini, W.-D.Apel, S.Banerjee, J.Bodenkamp, J.Engler, G.Flugge, D.C.Fries, W.Fues, K.Gamerdinger, G.Hopp, H.Kuster, H.Muller, H.Randoll, G.Schmidt, H.Schneider, W.de Boer, G.Buschhorn, G.Grindhammer, P.Grosse-Wiesmann, B.Gunderson, C.Kiesling, R.Kotthaus, U.Kruse, H.Lierl, D.Luers, H.Oberlack, P.Schacht, P.Colas, A.Cordier, M.Davier, D.Fournier, J.F.Grivas, J.Haissinski, V.Journe, A.Klarsfeld, F.Laplanche, U.Mallik, J.-J.Veillet, J.H.Field, R.George, M.Goldberg, B.Grossetete, O.Hamon, F.Kapusta, F.Kovacs, G.London, L.Poggioli, M.Rivoal, R.Aleksan, J.Bouchez, G.Carnesecchi, G.Cozzika, Y.Ducros, A.Gaidot, Y.Lavagne, J.Pamela, J.P.Pansart, F.Pierre.
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.270-6 (28 July 1983).
Results on the dominant decays of τ leptons produced in e^+e^- interactions at $\sqrt{s} = 34$ GeV are presented. The authors obtain the branching ratios $BR(\tau \rightarrow \rho\nu) = 0.228 \pm 0.033$, $BR(\tau \rightarrow \pi\nu) = 0.099 \pm 0.021$, $BR(\tau \rightarrow e\nu\nu) = 0.183 \pm 0.031$, $BR(\tau \rightarrow \mu\nu\nu) = 0.176 \pm 0.003$. From the laboratory momentum spectra of the observed decay products they determine the τ polarization asymmetry to $(1 \pm 22)\%$ and thereby derive limits for the vector coupling constant ν_τ of the τ to the weak neutral current. Tests on universality and factorization are discussed. (21 refs.)

13.40 ELECTROMAGNETIC PROCESSES AND PROPERTIES

13.40F Electromagnetic form factors; electric and magnetic moments

99455 Amplitude zeroes—tests of the magnetic moment of the W boson and the quarks. M.A.Samuel (Oklahoma State Univ., Stillwater, OK, USA).
AIP Conf. Proc. (USA), no.99, p.165-86 (1983). (Neutrino Mass and Gauge Structure of Weak Interactions, Cable, WI, USA, Sept. 1982).
The author considers the general phenomenon of amplitude zeroes, first discovered in the process $d\bar{u} \rightarrow W^-\gamma$. The effect of the quarks having an anomalous magnetic moment on the observed zeros (dips) in the angular distribution for the process $d\bar{u} \rightarrow W^-\gamma$ ($p\bar{p} \rightarrow W^-\gamma X$) is studied. It is found that for small values ($\leq 10^{-3}$) of the quark anomaly $[a \equiv (g-2)/2]$ the distributions are practically unaffected and as a increases, the dips gradually disappear. This study might provide one with a way of obtaining an upper bound for the anomalous magnetic moment of the W bosons. Using spin-0 particles, the author investigates the circumstances for amplitude zeroes to occur in the physical region and, as well, their location in phase space. Furthermore, the author asks whether or not these zeroes persist in higher order. The zeroes persist for internal line radiation and for radiation from internal bubbles. However, when one considers the 1-loop correction to the scalar three-point function (with a photon attached in all possible ways), it is shown, by an explicit calculation, that amplitude zeroes do not persist in general. (15 refs.)

99456 Proton and neutron magnetic moments in quantum chromodynamics. B.L.Ioffe, A.V.Smilga (Inst. of Experimental & Theoretical Phys., Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.5, p.298-301 (5 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.5, p.250-2 (5 March 1983).
The magnetic moments of the nucleons are calculated in nonperturbative quantum chromodynamics without the use of any models. The magnetic susceptibility of the quark condensate plays an important role in determining the magnetic moments. The calculated results agree well with experiment. (5 refs.)

99457 Comparison of the deep-inelastic structure functions of deuterium and aluminum nuclei. A.Bodek, N.Giokaris (Dept. of Phys. & Astron., Univ. of Rochester, Rochester, NY, USA), W.B.Atwood, D.H.Coward, D.L.Dubin, M.Breidenbach, J.E.Elias, J.I.Friedman, H.W.Kendall, J.S.Poucher, E.M.Riordan.
Phys. Rev. Lett. (USA), vol.51, no.7, p.534-7 (15 Aug. 1983).
The deep-inelastic electromagnetic structure functions of deuterium and aluminum nuclei have been measured. The kinematic dependence of the ratio of aluminium and deuterium structure functions is similar to the dependence of the ratio of steel and deuterium structure functions, and provides further evidence for the distortion of the quark momentum distributions of nucleons bound in a nucleus. (22 refs.)

99458 Structure functions of pseudoscalar mesons in a composite model with chromodynamic interaction. V.N.Kapshai, A.D.Linkevich, V.I.Savrin, N.B.Skachkov (Joint Inst. for Nuclear Res., Dubna, USSR).
Theor. & Math. Phys. (USA), vol.53, no.3, p.1196-203 (Dec. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.3, p.388-98 (Dec. 1982).
The solution of the equation for the wave function of a quark-antiquark system with interaction kernel taken in the form of the single-gluon exchange amplitude is used to calculate the asymptotic behaviour of meson structure functions. The obtained expressions contain terms leading to both power-law and logarithmic breaking of scaling. (25 refs.)

99459 QCD analysis of non-singlet neutrino structure functions. I.S.Barker (Dept. of Maths., City Univ., London, England), B.R.Martin, G.Shaw.
Z. Phys. C (Germany), vol.19, no.2, p.147-53 (1983).
The authors present a systematic analysis of all available neutrino xF_3 data, using an analytic parametrisation which incorporates second order QCD predictions for Q^2 evolution. They find $\Lambda_{\bar{M}\bar{S}} = 0.30 \pm 0.13$ GeV where the error is statistical, and both Fermi and *W*-boson propagator corrections have been made to the data. Neglect of the former has negligible effects, but neglect of the latter would increase Λ by ~ 0.1 GeV. They find that higher-twist effects are small and negative, and estimate their effect on the determination of Λ. They are unable to fit the data with higher-twist terms alone. (23 refs.)

13.60F Elastic and Compton scattering

99460 Deep inelastic Compton process and large QCD corrections. A.Czechowski (Inst. of Theoretical Phys., Warsaw Univ., Warsaw, Poland), M.Krawczyk, T.Hofmokl, A.Jacholkowska, M.Gorski.
Z. Phys. C (Germany), vol.19, no.2, p.95-100 (1983).
It is shown that so-called deep inelastic Compton process corresponding to the hard γq scattering at the parton level can provide information about the origin of large QCD corrections which manifest themselves as K-factors. Assuming that the K-factors of the Compton scattering are predominantly a soft gluon effect the authors obtain a significant difference between K-factors corresponding to different inclusive distributions. The numerical calculations for the incoming photon energy 100 GeV and 150 GeV are presented. (18 refs.)

99461 Probing spin-1 diquarks in deep inelastic structure functions. S.Fredriksson, M.Jandel, T.Larsson (Dept. of Theoretical Phys., Royal Inst. of Technol., Stockholm, Sweden).
Z. Phys. C (Germany), vol.19, no.1, p.53-5 (1983).
Within the scope of a new diquark model for deep inelastic structure functions presented by the authors recently, they use the existing data on $F_1{}^{ep}(x, Q^2)$ to learn about the admixture of spin-1 diquarks in nucleons. It turns out that they are so rare, heavy and extended compared to spin-0 diquarks that they are presumably accidental and not dynamical. Their number and form factors can be understood qualitatively within this picture. The spin-1 diquarks give interesting structures in data and, together with quarks and spin-0 diquarks, carry enough momentum to account for the full nucleon energy. A gluon component is hence not needed in the nucleon. (11 refs.)

13.60K Meson production

99462 Photoproduction of an isoscalar 3π resonance at 1.67 GeV. M.Atkinson, T.J.Axon, D.Barberis, T.J.Brodbeck, G.R.Brookes, J.J.Bunn, P.J.Bussey, A.B.Clegg, J.B.Dainton, M.Davenport, B.Dickinson, B.Diekmann, A.Donnachie, R.J.Ellison, P.Flower, P.J.Flynn, W.Galbraith, K.Heinloth, R.C.W.Henderson, R.E.Hughes-Jones, J.S.Hutton, M.Ibbotson, H.P.Jakob, M.Jung, M.A.R.Kemp, B.R.Kumar, J.Laberrigue, G.D.Lafferty, J.B.Lane, J.C.Lassalle, J.M.Levy, V.Liebenhau, R.H.McClatchey, D.Mercer, J.A.G.Morris, J.V.Morris, D.Newton, C.Paterson, G.N.Patrick, E.Paul, C.Raine, M.Reidenbach, H.Rotscheidt, A.Schlosser, P.H.Sharp, I.O.Skillicorn, K.M.Smith, K.M.Storr, R.J.Thompson, C.de la Vaissiere, A.P.Waite, T.P.Yiuo.
Phys. Lett. B (Netherlands), vol.127B, no.1-2, p.132-6 (21 July 1983).
A $\sigma\pi$ enhancement with mass 1.67 ± 0.02 GeV and width 0.16 ± 0.02 GeV is observed in the channel $\gamma p \rightarrow p\pi^+\pi^-\pi^0$. Assuming an incoherent background, the cross section×branching ratio is 100 ± 20 nb. A spin-parity analysis favours $J^P = 1^-$. The enhancement is most simply interpreted as a radial recurrence of the ω meson. (14 refs.)

13.65 HADRON PRODUCTION BY ELECTRON-POSITRON COLLISIONS

99463 The radiative annihilation of a lepton pair into a hadron pair. S.K.Abdullaev, A.I.Mukhtarov, V.Z.Mustafaev.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.6, p.83-90 (1982). In Russian.
The radiative annihilation of an e^-e^+-pair into an antiproton and nucleaon resonance was investigated. The cross section of the process is obtained taking into account spin correlations of particles. Numerical results are presented in the case of small angle photon emission. Invariant integration was used for obtaining integral cross sections and photon angles and energy distributions. The possibility of the determination of different structure functions of the process was investigated. (8 refs.)

99464 Experimental study of inclusive muon spectra from electron-positron collisions in the energy region $33 \leq \sqrt{s} \leq 38.54$ GeV. B.Adeva (III. Phys. Inst., Tech. Hochschule, Aachen, Germany), D.P.Barber, U.Becker, J.Berdugo, G.Berghoff, A.Boehm, J.G.Branson, J.D.Burger, M.Capell, M.Cerrada, C.C.Chang, H.S.Chen, M.Chen, M.L.Chen, M.Y.Chen, Y.S.Chu, R.Clare, E.Deffur, M.Demarteau, P.Duinker, Z.Y.Feng, H.S.Fesefeldt, D.Fong, M.Fukushima, D.Harting, T.Hebbeker, G.Herten, M.C.Ho, M.M.Ilyas, D.Z.Jiang, W.Krenz, P.Kuijer, Q.Z.Li, D.Luckey, E.J.Luit, C.Mana, M.A.Marquina, G.G.G.Massaro, R.Mount, H.Newman, M.Pho, F.P.Poschmann, R.R.Rau, J.P.Revol, S.Rodriguez, M.Rohde, J.A.Rubio, H.Rykaczewski, J.Salicio, I.Schulz, K.Sinram, M.Steuer, G.M.Swider, H.W.Tang, D.Teuchert, S.C.C.Ting, K.L.Tung, M.Q.Wang, M.White, H.G.Wu, S.X.Wu, B.Wyslouch, B.Zhou, R.Y.Zhu, Y.C.Zhu.
Phys. Rev. Lett. (USA), vol.51, no.6, p.443-6 (8 Aug. 1983).
The results of a high-statistics study of inclusive muon spectra at PETRA are reported. Improved mass limits have been obtained for heavy quarks, heavy leptons, and charged Higgs particles. It is shown that the fragmentation properties of b quarks and c quarks are different, with the mean fragmentation variables $\langle z_b \rangle = 0.75 \pm 0.03 \pm 0.06$, $\langle z_c \rangle = 0.46 \pm 0.02 \pm 0.05$ and the average semileptonic branching ratio for the B and C hadrons $R(B) = (10.5 \pm 1.5 \pm 1.3)\%$, $R(C) = (11.5 \pm 1.0 \pm 1.7)\%$. (16 refs.)

99465 Revelations of charm, beauty, and truth in high energy e^+e^- collisions. R.S.Panvini (Vanderbilt Univ., Nashville, TN, USA).
Surv. High Energy Phys. (Switzerland), vol.3, no.2, p.39-63 (1982).
Results from high energy e^+e^- experiments are surveyed for the purpose of showing striking features of the data that infer the existence of heavy quarks. A rich spectroscopy of hadronic states composed of heavy quarks is clearly revealed, and the decays of these states yields important information about the weak transitions of the quarks. All the current data favors the standard six quark model which includes the light u-, d-, and s-quarks as well as the newly discovered heavy c (charm) and b (beauty or bottom) quarks. The sixth quark in the standard model, t (truth or top), has yet to be discovered; however, a class of models without the t-quark is ruled out by the absence of flavor changing neutral currents that should have been seen in b-quark decays, according to these models. (42 refs.)

99466 Inclusive production of soft pions. H.D.Politzer, M.P.Shatz (California Inst. of Technol., Pasadena, CA, USA).
Z. Phys. C (Germany), vol.19, no.2, p.129-32 (1983).
Amplitudes for inclusive production of pions at zero four-momentum in e^+-e^-, hadron-hadron, and lepton-hadron collisions are computed using traditional soft pion techniques. However, the extrapolation to physical momenta appears to be problematical. Tests involving difference cross sections at relatively low energies are suggested. (6 refs.)

99468 A partial wave dispersion relation analysis of pion-nucleon scattering amplitudes. R.Koch, M.Hutt (Inst. fur Theoretische Kernphys., Univ. Karlsruhe, Karlsruhe, Germany).
Z. Phys. C (Germany), vol.19, no.2, p.119-28 (1983).
Partial wave dispersion relations have been evaluated, using various new πN partial wave solutions and the authors' results for the $\pi\pi NN$ amplitudes. The Karlsruhe-Helsinki 80 and CMU-LBL-79 solution for S; P, D, F waves are well compatible with this constraint, which follows from the Mandelstam representation. The VPI 80 solution leads to serious discrepancies in some cases, for instance for the P11 wave. In both the KH 80 and CMU-LBL 79 solutions the higher partial waves are not yet satisfactory. They can be improved by adding constraints based on the information on the nearby part of the left hand cuts. Properties of nucleon resonances are discussed in connection with their results for the 'generalized potentials'. (37 refs.)

13.75J Kaon-baryon interactions (energy ≤ 10 GeV)

99469 Anomalous Coulomb correction to the scattering length in connection with the shift of the ground level to the K^-p atom. B.O.Kerbikov (Inst. of Theoretical & Experimental Phys., USSR).
JETP Lett. (USA), vol.37, no.2, p.146-50 (20 Jan. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.2, p.118-21 (20 Jan. 1983).
It is shown for the case of an exactly solvable model that in an absorbing system the Coulomb correction to the scattering length is large where the scattering length itself is small. The anomalously large Coulomb correction to the $\bar{K}N$ scattering length is discussed as a possible explanation of the contradiction between the values of the $\bar{K}N$ scattering length obtained from low-energy $\bar{K}N$ scattering and those obtained from the shift of the ground level of the K^-p atom. (12 refs.)

99470 Charge-exchange scattering in K^-p interactions below 300 MeV/c. D.Evans (Dept. of Phys., Univ. of Durham, Durham, England), J.V.Major, E.Rondio, J.A.Zakrzewski, J.E.Conboy, D.J.Miller, T.Tymieniecka.
J. Phys. G (GB), vol.9, no.8, p.885-94 (Aug. 1983).
Cross sections for K^-p charge exchange, based on new data equal in statistics to the sum of those of all previous determinations below 300 MeV/*c*, are presented. The results confirm an earlier observation by this collaboration that the previous measurements of these cross sections at low momentum were significantly underestimated. Evidence for the presence of P wave scattering is presented. (14 refs.)

13.85 HADRON-INDUCED HIGH- AND SUPER-HIGH-ENERGY INTERACTIONS, ENERGY > 10 GEV

(for low energies, see 13.75)

99471 Correlations and fluctuations in hadronic multiplicity distributions: the meaning of KNO scaling. P.Carruthers, C.C.Shih (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.242-50 (28 July 1983).
Charged hadronic multiplicity distributions at Fermilab, ISR and collider energies are shown to be described by generalized Bose-Einstein distributions of the type encountered in quantum optics. Systematic energy-dependent deviations from KNO scaling are well described by simple cases of this formula, which in the limit of large $\bar{n}$ have a simple and explicit scaling form, valid to a few percent at the CERN collider energy. It is suggested that this framework is generic, i.e. practically independent of dynamical details. The essential feature is that the field variables of the 'radiant surface' for hadronic emission are distributed as gaussian random variables (with k effective sources) as suggested by a typical central limit theorem argument. In order to bring the lower energy data into a form easily comparable with higher energy data, particularly for the crucial large multiplicity events $(n/\bar{n})\gg 1$, it is essential to remove the two charges of the 'leading' particles from the counting rules. The long tail of the KNO distribution is to be identified with coherent fluctuations analogous to those occurring in the Hanbury-Brown-Twiss (1956, 1957) effect. (27 refs.)

13.85D Elastic scattering (energy > 10 GeV)

99472 Real part of the forward elastic scattering amplitude and high-energy behaviour of the total cross sections. I.M.Dremin, M.T.Nazirov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
JETP Lett. (USA), vol.37, no.3, p.198-201 (5 Feb. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.3, p.163-6 (5 Feb. 1983).
Dispersion-relation calculations show that data obtained on the ratio of the real and imaginary parts of the forward elastic scattering amplitude at the SPS colliding-beam installation will simplify extrapolation of the total *pp* cross sections to ultrahigh energies. (7 refs.)

99473 A phenomenological investigation of the $\bar{p}p$ slope parameter at $\sqrt{s}=540$ GeV. M.Kamran (Dept. of Phys., Punjab Univ., Lahore, Pakistan).
J. Phys. G (GB), vol.9, no.8, p.861-9 (Aug. 1983).
The author calculates and compares with experiment the predictions of a large number of model parametrisations on the $\bar{p}p$ slope parameter at $\sqrt{s}=540$ GeV. He finds that, apart from RFT fits, only a simple P-pole fit of Collins et al. (1973, 1974, 1978) comes close to a correct description of the collider data. Several well known models/fits which agree with the ISR data are found to fail at collider energies. The author also finds that a large pomeron slope in itself is not sufficient for a correct description of the *b* data at 540 GeV. (33 refs.)

99474 Proton-proton elastic scattering at 50 GeV/*c* incident momentum in the momentum transfer range $0.8<4.0$ $(\text{GeV}/c)^2$. Z.Asa'd, C.Baglin, R.Bock, J.M.Brom, L.Bugge, T.Buran, A.Buzzo, M.Coupland, D.G.Davis, B.G.Duff, T.Fearnley, S.Ferroni, I.Kenyon Gjerpe, J.P.Guillaud, V.Gracco, F.F.Heymann, D.C.Imrie, K.Kirsebom, A.Lundby, G.J.Lush, M.Macri, J.Myrheim, M.Phillips, M.Poulet, A.Santroni, G.Skjevling, S.O.Sorensen.
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.124-8 (18 Aug. 1983).
A measurement of the proton-proton elastic differential cross section at 50 GeV/*c* incident momentum in the momentum transfer range $0.8<|t|<4.0(\text{GeV}/c)^2$ is presented. The data are compared to pp data at lower and higher energies, and to some model predictions. (31 refs.)

Physics results from the CERN proton-antiproton collider ...... See Entry 99486

13.85H Inelastic scattering, many-particle final states (energy>10GeV)

99475 Wounded nucleons in α-α collisions at high energies. A.Bialas, A.Kolawa (Inst. of Phys., Jagellonian Univ., Cracow, Poland).
Acta Phys. Pol. B (Poland), vol.B14, no.7, p.539-54 (July 1983).
Distribution of the number w of wounded nucleons and of number v of inelastic collisions in α-α scattering at high energies is calculated using nuclear probability calculus. Correlations between w and v are also studied. The results are compared with generalized optical approximation. (9 refs.)

99476 Deck-coulombian effect calculation in the $\pi^\pm p\to\rho\pi^\pm p$ process. G.Missonnier, J.J.Dugne (Lab. de Phys., Corpusculaire, Aubiere, France).
Phys. Lett. B (Netherlands), vol.127B, no.1-2, p.126-8 (21 July 1983).
The authors display the big contribution of the Deck-coulombian effect for the π interaction at high energy and very small four-momentum transfers. This effect is calculated with a Williams-Weizsacker spectrum for the proton coulombian field and in the Born approximation for the $\pi^\pm\gamma\to\pi^\pm p$ process. (6 refs.)

99477 The reactions $pp\to pp\pi^+\pi^-$, $K^+p\to K^+p\pi^+\pi^-$, $\pi^+p\to\pi^+p\pi^+\pi^-$ and $\pi^-p\to\pi^-p\pi^+\pi^-$ at 147 GeV/c. D.H.Brick, H.Rudnicka, A.M.Shapiro, M.Widgoff (Brown Univ., Providence, RI, USA), R.E.Ansorge, W.W.Neale, D.R.Ward, B.M.Whyman, R.A.Burnstein, H.A.Rubin, E.D.Alyea,Jr., L.Bachman, C.-Y.Chien, P.Lucas, A.Pevsner, J.T.Bober, R.Dolfini, T.A.J.Frank, E.S.Hafen, P.Haridas, D.Huang, R.I.Hulsizer, V.Kistiakowsky, P.Lutz, S.Noguchi, S.H.Oh, I.A.Pless, T.B.Stoughton, V.Suchorebrow, S.Tether, P.C.Trepagnier, Y.Wu, R.K.Yamamoto, F.Grard, J.Hanton, V.Henri, P.Herquet, J.M.Lesceux, P.Pilette, R.Windmolders, H.de Bock, F.Crijns, W.Kittel, W.Metzger, C.Pols, M.Schouten, R.Van de Walle, H.O.Cohn, G.Bressi, E.Calligarich, C.Castoldi, S.Ratti, R.DiMarco, P.F.Jacques, M.Kalelkar, R.J.Plano, P.E.Stamer, T.L.Watts, E.B.Brucker, E.L.Koller, S.Taylor, L.Berny, S.Dado, J.Goldberg, S.Toaff, G.Alexander, O.Benary, J.Grunhaus, R.Heifetz, A.Levy, W.M.Bugg, G.T.Condo, T.Handler, E.L.Hart, A.H.Rogers, Y.Eisenberg, D.Hochman, U.Karshon, E.E.Ronat, A.Shapira, R.Yaari, G.Yekutieli, T.W.Ludlam, R.V.Steiner, H.D.Taft.
Z. Phys. C (Germany), vol.19, no.1, p.1-9 (1983).
All four reactions were detected with the same apparatus and analyzed in the same way. The energy dependence of the channel cross section was found to be $Ap^{-0.6}+B$ for the *pp* reaction and $Ap^{-1}+B$ for the other three. About 90% of the cross section can be accounted for by either beam or target diffraction. Some of the remaining cross section may come from double Pomeron exchange reactions which the authors have tried to isolate. They have tested the hypothesis of a factorizable Pomeron and the data indicates a violation of this hypothesis. They show that the 3π mass enhancement in the mass region 1.2-1.4 GeV is diffractively produced in the $\pi^\pm$ beam reactions. (22 refs.)

99478 Strangeness distributions in hadronic collisions. C.Pajares, A.Varias (Dept. de Fisica Teorica, Univ. de Santiago, Santiago de Compostela, Spain).
Z. Phys. C (Germany), vol.19, no.2, p.143-5 (1983).
The distribution of strangeness versus rapidity is studied in the multichain fragmentation model and in the one chain fragmentation model. It is shown that the multichain model describes rightly the K^+p strangeness distribution data. (14 refs.)

99479 The rapidity distribution of the cascade inside deuteron in πd high energy collisions. D.Kisielewska (Inst. of Nuclear Phys. & Tech., Acad. of Mining & Metall., Krakow, Poland).
Z. Phys. C (Germany), vol.19, no.2, p.155-8 (1983).
The problem of the existence of internuclear cascade and its characteristics are analysed in the π^-d experiment at 205 GeV/c. Two versions of the additive quark model are used to obtain the mean multiplicity and the rapidity distribution of charged particles produced through cascading. It is shown that the cascading effect does exist. The particles produced through this effect have the rapidity distribution very similar as in elementary low energy hadron-nucleon interactions. Both the rapidity distribution and the mean multiplicity do not depend on the version of the additive quark model which was used to obtain them. (12 refs.)

13.85K Inclusive reactions, including total cross sections, (energy > 10 GeV)

99480 Monotonically increasing hadronic temperature in high-multiplicity events at the CERN proton-antiproton collider. S.Barshay (III Phys. Inst., Tech. Hochschule Aachen, Aachen, Germany).
Phys. Lett. B (Netherlands), vol.127B, no.1-2, p.129-31 (21 July 1983).
High-multiplicity central events at the $\bar{p}p$ collider occur preferentially at small collision impact parameters. If the effective hadronic temperature increases monotonically with decreasing impact parameter, the mean transverse momentum of all produced particles will increase with the event complexity, in agreement with the new collider data and cosmic-ray observations. (14 refs.)

99481 Hadroproduction of $\psi\psi$. R.E.Ecclestone, D.M.Scott (Dept. of Appl. Math. & Theoretical Phys., Univ. of Cambridge, Cambridge, England).
Z. Phys. C (Germany), vol.19, no.1, p.29-35 (1983).
The authors calculate the cross sections $q\bar{q}\to\psi\psi$ and $gg\to\psi\psi$ in $0(\alpha^4_s)$ QCD. They compare their results with measurements in πN interactions, and give predictions for pN and $\bar{p}N$ interactions. The cross section for $\gamma\gamma\to\psi\psi$ is computed. (27 refs.)

99482 Large p_T hadron production in nucleus-nucleus collisions. M.Staszel (Inst. of Experimental Phys., Warsaw Univ., Warsaw, Poland), G.Wilk.
Z. Phys. C (Germany), vol.19, no.1, p.57-62 (1983).
The previously presented relations between inclusive cross sections for nucleus-nucleus nucleon-nucleus and nucleon-nucleon scatterings with large p_T production were generalized to include effects of large momentum tail of nucleons inside the nucleus. Simple numerical estimations show that these effects are likely to dominate the inclusive cross section for nucleus-nucleus collisions at very large p_T. (15 refs.)

99483 Correlations in the dual parton model. C.Pajares, A.Varias (Dept. de Fisica Teorica, Univ. de Santiago, Santiago de Compostela, Spain).
Z. Phys. C (Germany), vol.19, no.1, p.69-73 (1983).
The authors show that the dual parton model with the help of the recursive cascade model for the fragmentation functions is able to describe rightly the single and two-particle inclusive distributions at ISR energies. No free parameter is needed in such a description. (20 refs.)

99484 Correlation of charm particles from gluon-gluon fusion in hadronic collisions. S.N.Ganguli, M.Schouten (CERN, Geneva, Switzerland).
Z. Phys. C (Germany), vol.19, no.1, p.83-7 (1983).
In the framework of fusion process, ≈90% of which is $g+g\to c+\bar{c}$, the authors have calculated rapidity correlation and p^2_T of charm particles produced in hadronic collisions. The experimental observation of rapidity correlation by the LEBC-EHS Collaboration is in good agreement with the calculation. From the ratio of double to single charm production an estimate of fusion cross section is made. (11 refs.)

99485 The annihilation interaction, mean collision number and average multiplicity in antiproton-nucleus collisions. H.Sumiyoshi (Inst. for Nuclear Study, Univ. of Tokyo, Tokyo, Japan), H.Kondo, M.Uehara.
Z. Phys. C (Germany), vol.19, no.2, p.107-14 (1983).
Within the multiple scattering model it is discussed how to treat the annihilation interaction in antiproton-nucleus ($\bar{p}$-A) collisions by imposing the constraint that the real annihilation of the incident $\bar{p}$ can take place only once. The cross sections, mean collision numbers and average multiplicities are given both for the $\bar{p}$-A annihilation and non-annihilation events. The multiplicity difference between $\bar{p}$-A and p-A collisions is shown to be useful as a test of the annihilation mechanism. (26 refs.)

99486 Physics results from the CERN proton-antiproton collider. J.D.Dowell (Dept. of Phys., Univ. of Birmingham, Birmingham, England).
Proceedings of the 1982 CERN School of Physics (CERN 83-05), Cambridge, England, 5-18 June 1982 (Geneva, Switzerland: CERN 1983), p.247-64
Results from the 1981 operation of the CERN p$\bar{p}$ collider at 540 GeV obtained in experiments UA1, UA2, UA4 and UA5 are presented. The total cross section of 66±7 mb shows the expected rise from lower energies. Elastic scattering measurements are consistent with a lns shrinkage of the forward peak. The central pseudorapidity density for inclusive charged particle production rises as lns reaching a value of 3.3 particles per unit of rapidity and the multiplicity distribution exhibits KNO scaling when compared to ISR results below 63 GeV. Results for inclusive photon, strange particle and proton production are also given. The single particle p_t-spectrum for p_t up to 10 GeV/c is considerably flatter than at the ISR and shows a dependence on multiplicity. Evidence for jets is given. Both jet and single particle cross sections at high p_t agree with QCD predictions. Negative searches for Centauro events and free quarks are reported. Finally, future prospects are outlined. 99487 Possible explanation for scaling violation in hadron interactions above 10^3 TeV. N.N.Kalmykov, G.B.Khristiansen (M.V. Lomonosov Moscow State Univ., Moscow, USSR).
JETP Lett. (USA), vol.37, no.5, p.294-7 (5 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.5, p.247-9 (5 March 1983).
The discrepancy between the experimental data from extensive air showers and the predictions of the scaling model at energies above 10^3 TeV can be explained by the theory of a supercritical pomeron and the additive quark model. (17 refs.)

99488 Chirons, Geminions, Centauros, decays into pions: A phenomenological and theoretical analysis. P.Ammiraju, E.Recami, W.A.Rodrigues,Jr..
Report INFN/AE-83/3, Ist. Naz. Fis. Nucl., Catania, Italy (7 March 1983), 31 pp.
The authors analyse the data on multiple production of hadrons from very high-energy interactions, both at cosmic ray energies and at accelerator energies. They show that these data are compatible with a discrete mass spectrum of fireballs, which are formed in the very high-energy collisions and trail the colliding hadrons after the interaction. Such fireballs seem to possess different decay-modes: either into pions only, or into baryons only. The decays are statistical and they derive their temperature; for instance, in the so-called 'Chiron-mode' the temperature is about 10 GeV, which shows that the existence of a limiting temperature of 160 MeV in high-energy collisions is violated. Moreover, they present a theoretical model for decay-events like Chirons, Centauros and Geminions in terms of evaporating 'strong black-holes'. The analysis seems to suggest−among the others−that in the considered collisions some 'phase transitions' can take place, associated with the collapse of the colliding matter inside its strong-Schwarzschild horizons. The horizon radii are in good agreement with experience and, on their turn, yield the transition temperature through a Hawking-like relation. At these very high temperatures the emission of heavy objects is expected to be enhanced, so as it is observed experimentally. Many aspects of the data are reasonably well explained by the theoretical model. (25 refs.)

99489 Search for high-mass sequential leptons through the change of charge asymmetry in $W^\pm \rightarrow \gamma^\pm$+(neutrinos) decay. D.B.Cline, C.Rubbia (CERN, Geneva, Switzerland).
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.277-80 (28 July 1983).
The authors show that very massive charged heavy leptons can be detected as decay products in $W^\pm$ decays produced by proton-antiproton collisions. This technique is sensitive up to masses of 60 GeV/c^2 leptons if the associated neutrino is nearly massless. They show how this technique can be applied for W production at the CERN p$\bar{p}$ collider experiments and how it may be extended to the experiments at the 2 TeV p$\bar{p}$ collider at FNAL. 20.00 NUCLEAR PHYSICS

21.00 NUCLEAR STRUCTURE

21.10 GENERAL AND AVERAGE PROPERTIES OF NUCLEI; PROPERTIES OF NUCLEAR ENERGY LEVELS

(for properties of specific nuclei listed by mass ranges, see 27.)

99490 Crossing of single-particle energy levels resulting from neutron excess in the sd shell. M.H.Storm, A.Watt, R.R.Whitehead (Dept. of Natural Philosophy, Univ. of Glasgow, Glasgow, Scotland).
J. Phys. G (GB), vol.9, no.8, p.L165-8 (Aug. 1983).
It has been shown that the large discrepancies between calculation and experiment in the binding energies of neutron-rich isotopes of sodium and magnesium can be removed by extending the model space to include the $f_{7/2}$ shell. It is shown that the physical explanation of this result lies in the severe distortion of the underlying single-particle spectrum by the large neutron excess. (12 refs.)

99491 Strong and weak coupling to the octupole-deformed mode in $_{89}{}^{227}$Ac. R.K.Sheline (Dept. of Nuclear Phys., Australian Nat. Univ., Canberra, Australia), G.A.Leander.
Phys. Rev. Lett. (USA), vol.51, no.5, p.359-62 (1 Aug. 1983).
Hybrid values of the intrinsic gyromagnetic ratio and the absolute values of the decoupling parameters have been found for two sets of approximately degenerate opposite-parity bands with $K={}^3/_2{}^{\pm}$ and $K={}^1/_2{}^{\pm}$ in ^{227}Ac, as would be expected for intrinsic parity mixing in the single-particle states due to octupole deformation. These properties are able to test quantitatively the change in the Nilsson wave functions resulting from octupole deformation. (17 refs.)

99492 Algebraic methods for a direct calculus of observables in the theory of nuclear band structure. A.Klein (Dept. of Phys., Univ. of Pennsylvania, Philadelphia, PA, USA).
Prog. Part. & Nucl. Phys. (GB), vol.10, p.39-129 (1983).
The basis of much of the present understanding of nuclear structure derives from the study of mean field approximations (such as Hartree-Fock or Bardeen-Cooper-Schrieffer) and of small deviations from the mean field (random phase approximation and the cranking model). This review is devoted to the study of a theoretical framework (and of some applications of it) which provides not only a sound derivation of all these approximations but a basis for going beyond them. The approach may be characterized broadly as the application of Heisenberg matrix mechanics to the nuclear many-body problem. Various investigations carried out over two decades are described, including theoretical foundations, applications to schematic models, and applications to vibrational and rotational problems. In the concluding remarks, the author points to new developments which may alter these considerations profoundly by enlarging the framework in which they may be carried out. (134 refs.)

99493 Phonon operators in deformed nuclei. V.G.Solov'ev (Joint Inst. for Nuclear Res., Dubna, USSR).
Theor. & Math. Phys. (USA), vol.53, no.3, p.1203-7 (Dec. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.3, p.399-405 (Dec. 1982).
For the description of excited states of deformed nuclei, the mathematical formalism with phonon operators that do not depend on the sign of the angular momentum projection has proved inadequate. New phonon operators are introduced that depend on the sign of the projection of the angular momentum onto the symmetry axis of the deformed nucleus. It is shown that calculations with the new phonons take into account the Pauli principle correctly in the two-phonon components of the wave functions. There is a difference from calculations with phonons that do not depend on the sign of the angular momentum projection. The new phonons must be used in deformed nuclei if the Pauli principle is to be taken into account properly and in calculations with wave functions of excited states having components with more than one phonon operator. (10 refs.)

99494 Seniority-three yrast states in the N=82 nucleus ^{147}Tb. J.Styczen, M.Piiparinen, Y.Nagai, P.Kleinheinz (Inst. fur Kernphys., KFA Julich, Julich, Germany), D.Bazzacco, J.Eberth, J.Blomqvist.
Z. Phys. A (Germany), vol.312, no.3, p.149-54 (1983).
Firm spin-parity assignments for the high-spin states up to 3.5 MeV in the one-proton nucleus ^{147}Tb were obtained from ^{144}Sm(^{6}Li,3n) in-beam γ-ray and conversion electron measurements. The energies of these two-particle one-hole excitations were calculated from the shell model with empirical nucleon-nucleon interaction energies. The calculated energy splittings agree well with experiment, whereas the theoretical excitation energies disagree by $\gtrsim$1 MeV if recently measured ground state masses are used. (19 refs.)

99495 Rotation aligned bands and configuration dependent interaction in ^{189}Hg. M.Guttormsen, K.P.Blume, Y.K.Agarwal, A.Grumbkow, K.Hardt, H.Hubel, J.Recht, P.Schuler (Inst. fur Strahlen- und Kernphys., Univ. Bonn, Bonn, Germany).
Z. Phys. A (Germany), vol.312, no.3, p.155-62 (1983).
High spin states in ^{189}Hg have been studied using the ^{181}Ta(^{14}N,6n) reaction. The various one- and three-quasiparticle rotational bands were interpreted within the cranked shell model. The band-crossing frequencies are found to depend on the number of spectator particles. The effect can be accounted for by a residual two-body interaction of approximately −0.11 MeV. (20 refs.)

99496 A reconsideration of fission fragment angular distributions from nuclei of high spin. L.C.Vaz, J.M.Alexander (Dept. of Chem., State Univ. of New York, Stony Brook, NY, USA).
Z. Phys. A (Germany), vol.312, no.3, p.163-8 (1983).
It has often been stated that fission fragment angular anisotropy, as predicted by equilibrium statistical theory, should disappear with increasing spin of the composite nucleus. However, several recent experimental studies reveal strong anisotropies for fission fragments from high-spin nuclear systems. The authors discuss this apparent discrepancy and its relationship to the rigid-rotor approximation used in the standard theory. A systematic comparison is given for fission fragment anisotropies from many experiments via the empirical parameters K_0^2 and $\mathcal{J}_{\mathrm{eff}}$. These systematics indicate a strong regularity, provided one allows for the perturbing effects of fission after transfer reactions. Many of the observed anisotropies exceed the predictions of the standard theory, but, as these predictions are based on a rigid rotor model, this does not seem particularly note-worthy. (15 refs.)

99497 Coupling of one and two quasiparticles to a Bohr-Mottelson core in ^{195,196,197,198}Hg. M.Trefz, A.A.Raduta, A.Faessler, Th.J.Koppel (Inst. fur Theoretische Phys., Univ. Tubingen, Tubingen, Germany).
Z. Phys. A (Germany), vol.312, no.3, p.195-207 (1983).
A new model for coupling the motion of particles to that of a quadrupole collective core with rotations and β and γ vibrations is proposed. The Hamiltonian describing the core is obtained by quantising the classical Hamiltonian associated with the quadrupole degrees of freedom. The inertial parameters and the deformation energy surface are determined microscopically. The spherical shell model particles interacting among themselves by pairing are coupled to the core by a λ^2-pole ($\lambda=0, 2, 4$) potential. The theory is applied to $^{195-198}$Hg. The predicted results agree very well the experimental data. A comparison of the present model to the other formalism is also given. (51 refs.)

99498 Coherent quadrupole states of three interacting bands and the solution of a Bohr-Mottelson Hamiltonian. A.A.Raduta, A.Faessler, Th.Koppel, C.Lima (Inst. fur Theoretische Phys., Univ. Tubingen, Tubingen, Germany).
Z. Phys. A (Germany), vol.312, no.3, p.233-45 (1983).
The projected functions of the coherent state model (CSM) describing the ground, gamma and beta bands are studied in the intrinsic frame of reference. Several symmetry relations for the intrinsic functions are obtained. Analytical expressions for the matrix elements of the collective operator $\beta^{m+n}\cos^m\gamma\sin^n\gamma$ are derived. Important selection rules are established for them. The probability distribution for the deformations β and γ are studied and compared to those corresponding to the solution of a microscopically determined Bohr-Mottelson Hamiltonian. (35 refs.)

99499 Observation of the weakly deformed $\nu i_{13/2}{}^2$ band in ^{188}Hg. K.Hardt, Y.K.Agarwal, C.Gunther, M.Guttormsen, R.Kroth, J.Recht (Inst. fur Strahlen- und Kernphys., Univ. Bonn, Bonn, Germany), F.A.Beck, T.Byrski, J.C.Merdinger, A.Nourredine, D.C.Radford, J.P.Vivien, C.Bourgeois.
Z. Phys. A (Germany), vol.312, no.3, p.251-6 (1983).
High-spin states in ^{188}Hg have been investigated using the ^{168}Er(^{24}Mg,4n) reaction. The rotation aligned $\nu i_{13/2}{}^2$ band, which intersects the weakly oblate ground state band at $I \approx 10$, is observed up to $I^{\pi}=20^+$ with an isomeric 12^+ level with $T_{1/2}=134(15)$ ns. The coexisting strongly deformed band, built on the 825 keV 0^+ level, is observed up to the 14^+ state. The systematics of the $\nu i_{13/2}{}^2$ rotation aligned bands is discussed. (12 refs.)

99500 Measurement of isotropic variations in the charge radii of europium nuclei by the method of three-stepped laser photoionization of atoms. G.D.Alkhazov, A.E.Barzakh, E.I.Berlovich, V.P.Denisov, A.G.Dernyatin, V.S.Ivanov, A.N.Zherikhin, O.N.Kompanets, V.S.Letokhov, V.I.Mishin, V.N.Fedoseev (Inst. of Spectroscopy, Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.5, p.274-8 (5 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.5, p.231-4 (5 March 1983).
The optical isotopic shifts in atomic spectra are measured for the first time using the method of laser multistep photoionization of atoms and the changes in the mean-square charge radii of radioactive nuclei are determined. The measurements were performed for the radioactive isotopes $^{145\text{-}149}$Eu in the transition $4f^7 6s^2\ {}^8S_{7/2}{}^0$-$4f^7 6s\ 6p\,{}^6P_{7/2}$, $\lambda=576.5$ nm. (9 refs.)

99501 Effect of the Coriolis and centrifugal forces for nuclei with a stable octupole deformation. S.G.Rohozinski, W.Greiner (Gesellschaft fur Schwerionenforschung, Darmstadt, Germany).
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.1-4 (18 Aug. 1983).
Effects of the Coriolis and centrifugal forces for nuclei with a stable octupole deformation are examined in the frame of a schematic collective model. It is found that these effects are by no means attenuated with a rise of the octupole deformation. Taking them into account seems to allow for a consistent description of a strong anharmonization and differences in the moments of inertia of the positive- and negative-parity bands. (10 refs.)

99502 Nuclear size and compressibility. N.N.Kolesnikov, M.I.Starosotnikov (M.V. Lomonosov Moscow State Univ., Moscow, USSR).
Sov. Phys. J. (USA), vol.25, no.11, p.1049-53 (Nov. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.11, p.84-9 (Nov. 1982).
Data on electron scattering on nuclei and spectra of mesoatoms and atoms are used to construct new expressions for nuclear size, which consider the effects of shells and deformations together with the dependence on A and Z. The compressibility of nuclei is also considered. (16 refs.)

21.10K Electromagnetic moments

99503 An improved determination of the quadrupole moment of the first excited state of ^{208}Pb. R.H.Spear, W.J.Vermeer, M.T.Esat, J.A.Kuehner (Dept. of Nuclear Phys., Australian Nat. Univ., Canberra, Australia), A.M.Baxter, S.Hinds.
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.29-32 (18 Aug. 1983).
Coulomb-excitation studies of the 3^- first excited state of ^{208}Pb using ^{12}C and ^{16}O projectiles for a range of angles give -0.34 ± 0.15 e b for the static quadrupole moment ($Q(3^-)$) and 0.611 ± 0.012 e^2 b^3 for B(E3; $0^+ \rightarrow 3^-$). The value obtained for $Q(3^-)$ is substantially more precise and reliable than previous determinations, and is larger in magnitude than theoretical predictions. (26 refs.)

21.10M Level density and structure

99504 Nuclear spectroscopy of ^{90}Y. D.J.Decman, R.K.Sheline (Florida State Univ., Tallahassee, FL, USA), Y.Tanaka, E.T.Jurney.
Z. Phys. A (Germany), vol.312, no.3, p.209-19 (1983).
The level structure of ^{90}Y has been studied using the ^{91}Zr$(t,\alpha)^{90}$Y and ^{89}Y$(n,\gamma)^{90}$Y reactions. The proton pickup reaction was studied with 17 MeV tritons and a Q3D spectrometer. In the thermal ^{89}Y$(n,\gamma)^{90}$Y reaction γ-rays from ~100 to 6857 keV were observed. In addition to previously known states and configurations, the ten states of the $\pi(p^3/_2)^{-1}\ \nu(d^5/_2)^1$ and $\pi(f^5/_2)^{-1}\ \nu(d^5/_2)^1$ configurations are assigned. Also many other new levels are identified from the (n,γ) data. The 0^- state of the $\pi(f^5/_2)^{-1}\ \nu(d^5/_2)^1$ is assigned at 3130 keV. Finite-range shell model calculations suggest that the tensor force is necessary to reproduce the experimentally observed splittings. (26 refs.)

21.30 NUCLEAR FORCES

(see also 13.75C Nucleon-nucleon interactions)

99505 Meson-exchange corrections to the nuclear weak axial charge density in the hard pion model and $0^+ \rightleftarrows 0^-$ transitions in A=16 nuclei. H.-U.Jager, M.Kirchbach, E.Truhlik (Lab. of Theoretical Phys., Joint Inst. of Nuclear Res., Dubna, USSR).
Nucl. Phys. A (Netherlands), vol.A404, no.3, p.456-66 (15 Aug. 1983).
Starting with the hard-pion model based on a minimal chiral invariant phenomenological lagrangian, the two-body part of the time component of the weak axial-vector current is constructed in the tree approximation. Pion, rho- and A$_1$-meson exchanges are considered. The mesonic exchange operator obtained is applied to describe the purely weak axial $0^+ \rightleftarrows 0^-$, $\Delta T=1$ transition in the nuclear $A=16$ system. In order to treat nuclear structure correlation effects, explicit use of shell-model wave functions with configuration mixing is made. The authors confirm the large enhancement of the nuclear weak axial charge density with respect to impulse approximation. (21 refs.)

99506 A possible explanation of the difference between the structure functions of iron and deuterium. C.H.Llewellyn Smith (Dept. of Theoretical Phys., Univ. of Oxford, Oxford, England).
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.107-11 (18 Aug. 1983).
It is shown that the difference between $F_2{}^{\mathrm{Fe}}$ and $F_2{}^{\mathrm{D}}$ can be accounted for by a simplistic model in which iron contains 6-12 more pions than deuterium and these pions carry ~5% of the momentum. This requires the one-pion exchange contribution to be enhanced in heavy nuclei. A nuclear enhancement with the required characteristics has long been predicted. (17 refs.)

99507 Pionic corrections and the EMC enhancement of the sea in iron. M.Ericson, A.W.Thomas (CERN, Geneva, Switzerland).
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.112-16 (18 Aug. 1983).
It is shown that the European Muon Collaboration (EMC) enhancement in the region $x<0.3$ can be explained by an increase in the pion field in iron if there is an attractive force which mixes nucleon-hole and delta-hole states at momenta of order 300-400 MeV/c. Some experimental consequences of this explanation are discussed. (27 refs.)

99508 Microscopic collective nuclear potentials for vector and tensor forces. V.V.Vanagas (Inst. of Phys., Acad. of Sci., Lithuanian SSR).
Sov. Phys.-Collect. (USA), vol.22, no.2, p.1-8 (1982). Translation of: *Litov. Fiz. Sb. (USSR)*, vol.22, no.2, p.3-12 (1982).
General expressions for the collective terms of the vector and tensor forces are obtained, and explicit expressions for the potentials of these forces in the case of multipole interactions are given. Aspects of the collective potential of vector and tensor forces are discussed. (10 refs.)

99510 Configuration space Faddeev calculations. VI. Triton wave function. J.L.Friar, B.F.Gibson (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA), G.L.Payne.
Z. Phys. A (Germany), vol.312, no.3, p.169-75 (1983).
For pt.V see Phys. Rev. C., vol.24, no.5, p.2279-89 (1981). The triton ground-state wave function calculated using the Reid soft-core potential is displayed in configuration space. Both the S-state and D-state Schrodinger wave function components and the Faddeev amplitudes from which they are constructed are plotted. Specific features resulting from the tensor nature of the two-body force and from the strong short-range repulsion of the potential are discussed. Comparisons with corresponding functions generated by the Malfliet-Tjon s-wave potential model are made. Several intuitive features of the Schrodinger wave function are discussed. (14 refs.)

21.60C Shell model

99511 Bound-state shell model with full correction for spurious centre-of-mass motion. R.Shyam (Inst. fur Kernphys., Tech. Hochschule Darmstadt, Darmstadt, Germany), M.A.Nagarajan.
J. Phys. G (GB), vol.9, no.8, p.901-12 (Aug. 1983).
A method to take fully into account the spurious CM motion in the shell model wavefunctions for the bound state is presented. This method is based on the earlier method of Philpott (1977) given for the continuum shell model. The exact intrinsic wavefunctions for the bound states obtained by this method have been used to calculate the form factors for the nucleon transfer reactions. These form factors have been compared with the CM-corrected form factors obtained by the approximate method of Pinkston (1976, 1977). It is found that Pinkston's method underestimates the CM corrections to the overlap functions for one-nucleon transfer reactions. (12 refs.)

99512 Particle-number-conserving method for treating the nuclear pairing correlation. J.Y.Zeng (The Niels Bohr Inst., Univ. of Copenhagen, Copenhagen, Denmark), T.S.Cheng.
Nucl. Phys. A (Netherlands), vol.A405, no.1, p.1-28 (22 Aug. 1983).
A particle-number-conserving (PNC) method for treating the nuclear pairing correlation is presented. The difficulties encountered in the BCS method (particle-number nonconservation, spurious states, blocking effect and orthogonality, etc.) disappear in the PNC treatment. A detailed comparison between the BCS and PNC methods is made. It is found that the shape and the state density of the low-lying spectra obtained are quite different from those of the quasiparticle spectra obtained in the BCS method. Large differences between the two methods are found in the occupation probabilities in the excited states, the branching ratios for two-particle transfer reactions, etc. Blocking effects in the energy and the moment of inertia are analyzed. The residual quasiparticle interaction and the relation between the even-odd mass difference and quasiparticle energy are investigated. Pair vibration and pair rotation are investigated in the framework of the PNC formalism. (10 refs.)

21.60E Collective models

99513 Cylindrical $\bar{s}\bar{p}$-boson model for large deformed nuclei. Hsi-Tseng Chen (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan), A.Arima.
Phys. Rev. Lett. (USA), vol.51, no.6, p.447-50 (8 Aug. 1983).
It is proposed that the intrinsic states in a well deformed nucleus may be described as those of a system of nonspherical bosons, each possessing quasispin 1, $\bar{p}$, or quasispin 0, $\bar{s}$. The model is tested by the experimental data with analytical expressions which have been derived for the bandheads and the $E2$ transitions. (7 refs.)

99514 On the effective number of bosons in the interacting boson model. O.Scholten (Dept. of Phys. & Astron., Michigan State Univ., East Lansing, MI, USA).
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.144-6 (28 July 1983).
A procedure for calculating the effective number of bosons in the interacting boson model is proposed. As an example, a calculation is presented for the 50-82 major shell for protons in which there is a subshell closure at $Z=64$. (12 refs.)

99515 The structure of the S and D pairs of the Interacting Boson Model from the Hartree-Fock-Bogolyubov approximation. S.Pittel (Bartol Res. Found., Franklin Inst., Univ. of Delaware, Newark, DE, USA), J.Dukelsky.
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.9-14 (18 Aug. 1983).
The Hartree-Fock-Bogolyubov approximation is used to determine the optimum choice for the S and D pairs of the microscopic Interacting Boson Model. Results are presented for the even Sm isotopes. (19 refs.)

99516 Diagram representation of the single-phonon propagator in the quasiparticle-phonon model of nuclei. G.Kyrchev (Joint Inst. for Nuclear Res., Dubna, USSR).
Theor. & Math. Phys. (USA), vol.53, no.2, p.1113-19 (Nov. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.2, p.260-70 (Nov. 1982).
A diagram technique is proposed for the quasiparticle-phonon model of nuclei. It is shown that restriction to single-phonon and two-phonon components in the wave functions of the excited states of even-even deformed nuclei is equivalent to summation of a definite class of single-loop diagrams. The contribution of a two-loop diagram is calculated. Further, closure of the hierarchy of equations for the Green's functions yields explicit approximations that lead to summation of the considered class of graphs. (16 refs.)

99517 The Interacting Boson Model and its connection with group theory. B.R.Barrett (Dept. of Phys., Univ. of Arizona, Tucson, AZ, USA).
Group Theoretical Methods in Physics. Proceedings of the XI International Colloquium, Istanbul, Turkey, 23-28 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.407-21
The interacting Boson Model for only one kind of s and d bosons is described, and its connection with the group U(6) of unitary transformations of six dimensions is demonstrated. It is then shown how the subgroup chains of U(6) facilitate the solution of the eigenvalue problem for the s and d bosons in certain limiting cases. (15 refs.)

99518 A hidden symmetry in collective excitations of many-body systems. M.Moshinsky (Inst. de Fisica, Univ. Autonoma de Mexico, Mexico City, Mexico), Q.Castanos, A.Frank.
Group Theoretical Methods in Physics. Proceedings of the XI International Colloquium, Istanbul, Turkey, 23-28 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.437-43
A collective Hamiltonian derived from an A-nucleon system is analyzed in the large A-limit and its hidden symmetry group identified. (15 refs.)

99519 The U(6) symmetry in the microscopic collective model. J.Deenen, C.Quesne (Univ. Libre de Bruxelles, Brussels, Belgium).
Group Theoretical Methods in Physics. Proceedings of the XI International Colloquium, Istanbul, Turkey, 23-28 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.444-7
For any number of particles, the collective part of the harmonic oscillator Hamiltonian is shown to reduce to a six-dimensional harmonic oscillator. There is therefore a hidden U(6) symmetry in the microscopic collective model. (6 refs.)

99520 A formalism for the microscopic Interacting Boson Model with non-degenerate orbits. A.Frank, P.Van Isacker (Univ. Nacional Autonoma de Mexico, Mexico City, Mexico).
Group Theoretical Methods in Physics. Proceedings of the XI International Colloquium, Istanbul, Turkey, 23-28 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.450-1
The authors discuss a formalism for the microscopic theory of the interacting boson model with non-degenerate shell model orbits, which is concise and simple for numerical calculations. They briefly indicate two of the possible applications of this formalism. (1 ref.)

21.60F Models based on group theory

99521 Boson mappings in nuclear physics. A brief and prejudiced survey. A.Klein (Dept. of Phys., Univ. of Pennsylvania, Philadelphia, PA, USA).
Group Theoretical Methods in Physics. Proceedings of the XI International Colloquium, Istanbul, Turkey, 23-28 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.422-35
The physical problems which stimulated the study of boson mappings are reviewed. The various mathematical techniques available for this problem are outlined. It is emphasized that the first mapping technique found in the literature, that of Holstein-Primakoff (HP), has been insufficiently exploited. A modified HP technique is illustrated. The unresolved problems in connection with the derivation of the interacting boson model are illustrated by means of a simplified model, and a proposal for a solution is made. (28 refs.)

99522 Does accidental degeneracy imply a symmetry group?. M.Moshinsky (Inst. de Fisica, Univ. Nacional Autonoma de Mexico, Mexico City, Mexico), C.Quesne.
Group Theoretical Methods in Physics. Proceedings of the XI International Colloquium, Istanbul, Turkey, 23-28 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.436
Summary form only given. The object of this paper is to probe the relation, which is usually taken for granted, between the appearance of accidental degeneracy in the energy levels of a given Hamiltonian and its symmetry group. This is done by analyzing the very simple problem of an oscillator to which a particular spin-orbit and centrifugal force are added. The authors find the operators that connect all the states of given energy as well as their corresponding observables in the classical limit. The Poisson bracket relations between these observables leads to a Lie Algebra U(3)×SU(2), but it does not translate into a Lie Algebra for the commutators of the corresponding operators, as some matrix elements of commutators, corresponding to Poisson brackets that are zero, do not vanish. Thus while accidental degeneracy in the quantum problem may lead to a larger group in the classical limit, it is not always given by the dimensions of the irreducible representations of this group. (no refs.)

99523 SO(2n+1) in an $[SU(2)]^n$ basis: symmetric representations. H.De Meyer, G.Vanden Berghe, P.De Wilde (Rijks Univ. Gent, Gent, Belgium).
Group Theoretical Methods in Physics. Proceedings of the XI International Colloquium, Istanbul, Turkey, 23-28 Aug. 1982 (Berlin, Germany: Springer-Verlag 1983), p.448-9
The number of internal labels of symmetric irreducible representations (SIRs) of SO(2n+1) equals 2n−1, as can be verified from a simple counting rule of Seligman and Sharp. One possible way to define such labels is to reduce the SIRs of SO(2n+1) into IRs of its maximal sub-algebra SO(2n−3)⊗Su(2)⊗SU(2) and to verify that no degeneracies are left. In order to derive the branching rule (restricted to SIRs) various methods are at one's disposal. Recently, the authors obtained the expression $SO(2n+1)\rightarrow SU(2)\otimes SU(2)\otimes SO(2n-3)$: $[v,0,\ldots,0]\rightarrow\Sigma_{\mu=0}{}^{v}\Sigma_{\lambda=0}{}^{[v-\mu/2]}(\mu/2,\mu/2,[v-\mu-2\lambda,0,\ldots,0])$, with n−1 zeros on the left hand side and n−3 zeros on the right hand side. The authors are concerned with the application of this expression for the case n=3. The main reason is that the reduction of SIRs of SO(7), which are closely related to the nuclear octupole phonon states, is a relevant step for solving the octupole phonon state labelling problem. (5 refs.)

21.60G Cluster models

99524 Resonating group kernels for complex cluster systems. Y.Suzuki (Phys. Dept., Niigata Univ., Niigata, Japan).
Nucl. Phys. A (Netherlands), vol.A405, no.1, p.40-54 (22 Aug. 1983).
The Bargmann transform technique has been generalized to evaluate the resonating group kernels needed for the microscopic cluster model in which constituent fragments are described by harmonic oscillator functions with unequal width parameters. All the techniques developed for the case of equal width parameters are applicable without any change except for a slight modification of the transformation to the Bargmann space cluster-internal and cluster-relative motion vectors. The inversion of the Bargmann transformation has been carried out for those Bargmann transforms which appear in the cluster model, making it possible to gain the kernels in a closed algebraic form. The kernels for the α+d and 9-quark 3-nucleon systems have been evaluated to illustrate the technique. (12 refs.)

21.60J Hartree-Fock and random-phase approximations

99525 On the general theory of nuclear non-equilibrium systems (statistical equations and 'nuclear hydrodynamics'). M.K.Weigel, J.Winter (Sektion Phys., Ludwig-Maximilians-Univ. Munchen, Garching, Germany).
J. Phys. G (GB), vol.9, no.8, p.913-29 (Aug. 1983).
The Green function method is used as the basic theory for the purpose of investigating the general structure of nuclear non-equilibrium systems. Firstly, the equations for the Green functions for Fermi systems in the real time domain are derived by application of Schwinger's variational principle for causal processes. In the second step the statistical equations (Boltzmann equation) are obtained from the first energy moments of the Green functions. By assuming a weak energy dependence of the mass operator it is then possible to generalise the time-dependent Hartree-Fock approach. The third step deals with the statistical approach to (nuclear) hydrodynamics by integrating the weighted Wigner transforms. As an example, the microscopic structure of the forces for the centre-of-mass motion of two colliding nuclei is investigated. It turns out that the 'optical' potential determines the behaviour of the systems. (33 refs.)

99526 Application of linear response theory to light odd-A nuclei in s-d shell. S.Sengupta (Phys. Dept., Burdwan Univ., Burdwan, India), T.K.Das.
Rev. Bras. Fis. (Brazil), vol.12, no.3, p.541-9 (Sept. 1982).
Microscopic calculations have been performed for light s-d shell nuclei using the linear response theory (LRT), in which the odd-A nuclear wave function is built on the even even (A-l) Hartree-Fock-Bogoliubov solution. The variational parameters are obtained by solving the linearized equations. The pairing plus quadrupole force has been used as residual interaction. Calculated BE, Q_J and $B(E2)$ values agree fairly well with available experimental data. (16 refs.)

21.65 NUCLEAR MATTER

99527 Thermodynamical theory of pion condensation. G.G.Bunatian (JINR, Dubna, USSR), I.N.Mishustin.
Nucl. Phys. A (Netherlands), vol.A404, no.3, p.525-50 (15 Aug. 1983).
A thermodynamical approach to the description of the pion field and π-condensation in nuclear matter of high density and nonzero temperature is developed. It has been shown that the quantum and thermal fluctuations of pion fields play a decisive role near the critical point; they are the reason why the equation $D^{-1}(\omega,k,\rho,T)=0$ has no solutions $\omega^2(k)<0$ at any density ρ and temperature T, i.e. the criterion earlier used for the formation of the π-condensate is not satisfied. In order that the π-condensate may arise in the system with given ρ, T the thermodynamical potential should decrease when the π-condensate field is switched on: $\Delta\Omega(\phi)\leq 0$. The character as well as the critical parameters of the phase transition are strongly dependent on the effective $\pi\pi$ interaction. In the framework of the $\Lambda\phi^4$ model, the critical density and the jumps of the condensate field amplitude, along with the renormalized gap of the pion excitation spectrum and of the thermodynamical quantities, are estimated. The area of applicability of the authors' approach as well as possible consequences of the theory are discussed. (25 refs.)

99528 Kinetic theory for plasmas with non-Abelian interactions. U.Heinz (Inst. for Theoretische Phys. Johann Wolfgang Geothe-Univ., Frankfrut-am-Main, Germany).
Phys. Rev. Lett. (USA), vol.51, no.5, p.351-4 (1 Aug. 1983).
The derivation of kinetic equations for the classical and quantum (Wigner) distribution functions for a plasma with non-Abelian interactions is outlined. Particular emphasis is put on the relation between the color structures in the classical and the quantum theories. (16 refs.)

99529 Theory of model-space single-particle potential and its application to nuclear matter calculations. Z.Y.Ma, T.T.S.Kuo (Dept. of Phys., State Univ. of New York, Stony Brook, NY, USA).
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.137-43 (28 July 1983).
A theory of the model-space nuclear single-particle potential U is proposed, where the condition for determining U is that the one-body part of the resulting model-space effective interaction vanishes. Preliminary application to nuclear matter calculations has been made. It has led to a continuous self-consistent single-particle spectrum $\epsilon_k{}^M$ up to k_M, the momentum space boundary of the chosen model space, such as 3 fm^{-1}. Comparing with the usual BHF nuclear matter calculations using a discontinuous single-particle spectrum, the use of $\epsilon_k{}^M$ has increased in low-order calculations the nuclear matter binding energy by about 3 MeV, coming predominantly from the $^3S_1$-$^3D_1$ channel. (18 refs.)

99530 A connection between the relativistic mean field approach and effective interactions. A.Bouyssy, S.Marcos (Div. de Phys. Theorique, Inst. de Phys. Nucleaire, Orsay, France).
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.157-61 (28 July 1983).
Starting first from the relativistic mean field approach of finite nuclei, the Dirac equation is reduced to a Schrodinger equation which resembles very much the Hartree-Fock-Skyrme equation. As an alternative, a low density expansion of the energy in nuclear matter is performed and both approaches are compared. The connection with effective hamiltonians is discussed, as well as the possible relation between realistic parameters and effective ones. (15 refs.)

99531 Abnormal nuclei. J.Boguta (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.19-23 (18 Aug. 1983).
The Lee-Wick idea of abnormal nuclei is realized in a saturating chiral field theory of nuclear matter. It describes normal nuclear matter reasonably well. The properties of abnormal nuclei are investigated by solving the non-linear field equations numerically. Abnormal nuclei are shell like, having most of their mass concentrated on the surface. Implications of chiral symmetry, such as the existence of topological quantum number, is also discussed. (10 refs.)

99532 Effect of confinement size on nuclear structure functions. F.E.Close, R.G.Roberts, G.G.Ross.
Report RL-83-051, Rutherford Appleton Lab., Chilton, Oxon., England (June 1983), 12 pp.
The authors consider the differences in the structure function of a heavy nucleus such as iron, compared to a light nucleus. They investigate, in the context of QCD, a suggestion that these differences arise as a result of differences in the scale of confinement of the nuclear constituents. This results in a simple relationship between heavy and light nucleus structure functions which is in reasonable agreement with experiment if the confinement size in iron is around 10-20% greater than in a free nucleon. (11 refs.)

23.00 RADIOACTIVITY AND ELECTROMAGNETIC TRANSITIONS

(see also 82.55 Radiochemistry)

23.20 ELECTROMAGNETIC TRANSITIONS

99533 Levels and transitions in ^{124}Te following thermal-neutron capture by ^{123}Te and the β decay of oriented ^{124}Sb. S.J.Robinson, W.D.Hamilton (Phys. Div., Univ. of Sussex, Brighton, England), D.M.Snelling.
J. Phys. G (GB), vol.9, no.8, p.961-84 (Aug. 1983).
Levels and γ-ray transitions in ^{124}Te have been studied using the techniques of directional correlation and nuclear orientation. Directional correlation measurements were performed on the γ-rays observed following thermal-neutron capture by ^{123}Te and the selection of several coincidence gates has allowed a comprehensive level scheme to be produced. The spins of 15 levels have been proposed from the directional correlation results and multiple mixing ratios have been extracted for 8 of the most intense transitions. Directional distribution measurements have been performed on the γ radiation observed following the β decay of oriented ^{124}Sb. The orientation was obtained by diffusing the antimony into iron and cooling to 6.5 mK. The observed anisotropies in the γ-radiation patterns have allowed 3 spin assignments to be made and 14 multipole mixing ratios to be extracted. The levels in ^{124}Te are discussed in terms of the simple vibrational phonon and interacting boson models. It is shown that ^{124}Te is a new example of O(6) nuclear symmetry within the boson model. (49 refs.)

99534 Quenched magnetic transitions from high spin states in light nuclei. P.Blunden, B.Castel (Oak Ridge Nat. Lab., Oak Ridge, TN, USA), H.Toki.
Z. Phys. A (Germany), vol.312, no.3, p.247-9 (1983).
Recent investigations of stretched $M6$ transitions in the s-d shell have uncovered the unexpected systematic trend that isoscalar $M6$ transitions are two to three times more retarded than the isovector ones. The authors present the result of a microscopic calculation analyzing the different mechanisms usually invoked in the formation of the quenching and suggest that an additional argument based on the difference in structure between isoscalar and isovector transition densities may be playing a predominant role in explaining the data. (17 refs.)

99535 Core excitations and M1 strengths in the Ca isotopes. B.A.Brown, D.J.Horen, B.Castel, H.Toki (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.151-4 (28 July 1983).
The existence of strong M1 transitions from $T=1$ and $T=2$ states in ^{40}Ca provides an interesting challenge to nuclear structure models. The authors show that the recent M1 data can be reconciled with a shell model study of ^{40}Ca and that the fragmentation and disappearance of strengths in ^{42}Ca and ^{44}Ca is consistent with a weak coupling extension of the ^{40}Ca system in which the M1 strength is divided among T_z and T_{z+1} components. (20 refs.)

23.20N Internal conversion and extranuclear effects

99536 Weak gamma transition of 0.89 MeV of ^{207}Pb. R.K.Mishra (Dept. of Phys., Al-Fateh Univ., Tripoli, Libya).
Curr. Sci. (India), vol.52, no.11, p.544 (5 June 1983).
The author describes the attempts to detect the weak gammas by analysing the single conversion electron spectrum with a surface barrier Si-detector. (4 refs.)

99537 Atomic-charge-state distributions of fusion-evaporation residues and nuclear shape changes at high spin. T.M.Cormier, P.M.Cormier, M.Herman, N.G.Nicolis, P.M.Stwertka (Dept. of Phys. & Astron., Univ. of Rochester, Rochester, NY, USA).
Phys. Rev. Lett. (USA), vol.51, no.7, p.542-5 (15 Aug. 1983).
The average internal-conversion probabilities as a function of spin for continuum γ transitions are deduced from the energy dependence of the evaporation-residue atomic-charge-state distributions. Strongly enhanced internal-conversion probabilities are observed at high spin. The implications of these results for nuclear shapes at high spin are considered. (14 refs.)

23.40 BETA DECAY; ELECTRON AND MUON CAPTURE

99538 Recent theoretical progress on the $\beta\beta$ decay. E.Takasugi (Inst. of Phys., Osaka Univ., Osaka, Japan).
AIP Conf. Proc. (USA), no.99, p.207-17 (1983). (Neutrino Mass and Gauge Structure of Weak Interactions, Cable, WI, USA, Sept. 1982).
The general feature of the $\beta\beta$ decay is reviewed and the recent theoretical progress is discussed. (18 refs.)

99539 Geochemical double beta decay experiments. T.Kirsten (Max-Planck-Inst. fur Kernphys., Heidelberg, Germany).
AIP Conf. Proc. (USA), no.99, p.218 (1983). (Neutrino Mass and Gauge Structure of Weak Interactions, Cable, WI, USA, Sept. 1982).
Double beta decay provides a very sensitive test of lepton-quark symmetry; unfortunately, however, decay rates are so small that it has not yet been possible to unequivocally detect a double beta decay event directly. More important therefore is the data obtained by the 'geochemical' method where one detects the double beta decay products which have accumulated in natural minerals during long geological time periods. The author discusses the principles of the geometrical method, its strength and its limitations, the available data, new results on the ^{128}Te-^{130}Te system; theoretical implications of the data concerning the electron neutrino restmass and lepton-number conservation. A limit of $m_\nu \leq 5.6$ eV (95% confidence) has been obtained from the recent ^{128}Te-^{130}Te-measurements. (no refs.)

99540 Recent results obtained in experiments on double beta decay of ^{76}Ge and other nuclides. E.Bellotti, E.Fiorini, C.Liguori, A.Pullia, A.Sarracino, L.Zanotti (Dipartimento di Fisica, Univ. di Milano, Milano, Italy).
AIP Conf. Proc. (USA), no.99, p.219-24 (1983). (Neutrino Mass and Gauge Structure of Weak Interactions, Cable, WI, USA, Sept. 1982).
Results are reported of an experimental search for lepton number violation in ^{76}Ge, ^{150}Nd, ^{148}Nd, ^{100}Mo, ^{58}Ni, and ^{92}Mo decays. The experimental set up has been running under M. Blanc ($\sim$5000 m w.e. depth). No evidence has been found so far for any type of neutrinoless process. Limits of 10^{22} years for ^{76}Ge transitions are reported. (13 refs.)

99541 Neutrinoless $\beta\beta$-decay in gauge theories. J.D.Vergados (Dept. of Phys., Univ. of Ioannina, Ioannina, Greece).
AIP Conf. Proc. (USA), no.99, p.225-43 (1983). (Neutrino Mass and Gauge Structure of Weak Interactions, Cable, WI, USA, Sept. 1982).
The lepton violating neutrinoless $\beta\beta$-decay is investigated in the context of fashionable gauge theories. Various mechanisms are examined, e.g. light or heavy neutrinos, with or without right-handed currents, intermediate doubly charged Higgs particles, majoron emission, etc. Numerical results have been obtained for the transitions $^{48}\mathrm{Ca} \rightarrow {}^{48}\mathrm{Ti}$ ($\beta^-\beta^-$) and $^{58}\mathrm{Ni} \rightarrow {}^{58}\mathrm{Fe}$ ($\beta^+\beta^+$, electron capture, double electron capture) employing realistic nuclear models. (35 refs.)

99542 Future double beta decay experiments. D.O.Caldwell (Univ. of California, Santa Barbara, CA, USA).
AIP Conf. Proc. (USA), no.99, p.244-9 (1983). (Neutrino Mass and Gauge Structure of Weak Interactions, Cable, WI, USA, Sept. 1982).
Double beta decay laboratory experiments in progress or planned are surveyed. Particularly searches for neutrinoless double beta decay are emphasized and present limits on lifetimes and corresponding neutrino masses given. Especially discussed is a UCSB-LBL ^{76}Ge experiment which may reach limits $\sim 10^{24}$ years or $\sim$1 eV for m_ν. (6 refs.)

99543 Resonant neutrino activation and neutrino oscillations. W.P.Kells (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
AIP Conf. Proc. (USA), no.99, p.272-81 (1983). (Neutrino Mass and Gauge Structure of Weak Interactions, Cable, WI, USA, Sept. 1982).
Low Q value weak nuclear decays are considered which have two body final states (electron captures and bound state beta decays, BSD). This permits an analogy with the Mossbauer effect, where the emitted (anti)neutrinos will resonantly activate daughter nuclei in a suitable absorber. Candidates for such a process are examined and the relevant solid state host problems are discussed. The author points out that resonant line widths as large as the narrowest observed in Mossbauer spectroscopy suffice to greatly extend the sensitivity of ν (disappearance) oscillation experiments. (16 refs.)

99544 Relativistic Hartree-Fock calculations of K-shell ionization probabilities in beta decay. T.Mukoyama (Inst. for Chem. Res., Kyoto Univ., Kyoto, Japan), T.Kagawa.
Bull. Inst. Chem. Res. Kyoto Univ. (Japan), vol.61, no.1, p.36-44 (March 1983).
The *K*-shell ionization probabilities in β^- decay have been calculated for ^{185}W and ^{203}Hg using the relativistic Hartree-Fock wave functions. The effect of the indistinguishability of two electrons in the final state is taken into consideration. The calculated results are compared with the experimental data and other theoretical predictions. (27 refs.)

99545 Electron capture to positron branching ratios in the decay of ^{22}Na and ^{44}Sc. A.P.Baerg (Phys. Div., Nat. Res. Council of Canada, Ottawa, Ontario, Canada).
Can. J. Phys. (Canada), vol.61, no.8, p.1222-6 (Aug. 1983).
The electron capture to positron branching ratios, e/β^+, in the decay of ^{22}Na and ^{44}Sc have been re-measured by a new anticoincidence counting method. The results confirm the earlier values obtained by coincidence counting, but with a significantly reduced uncertainty. The new values are: 0.1079 ± 0.0003 for decay of ^{22}Na to the 1.27 MeV level in ^{22}Ne and 0.0499 ± 0.0005 for decay of ^{44}Sc to the 1.16 MeV level in ^{44}Ca. (8 refs.)

99546 Double beta decay of ^{128}Te/^{130}Te and the question of a neutrino Majorana mass. K.Grotz, H.V.Klapdor, J.Metzinger (Max-Planck-Inst. fur Kernphys., Heidelberg, Germany).
J. Phys. G (GB), vol.9, no.8, p.L169-73 (Aug. 1983).
The 2ν double beta ($\beta\beta$) decay of ^{30}Te and ^{128}Te is calculated in the PBCS pairing model. A correct treatment of the phase-space integral shows that the Pontecorvo (1968) argument leads to an incorrect half-life ratio. This has severe impact on the discussion of neutrinoless β decay and a possible neutrino mass. (27 refs.)

99547 The half-lives of ^{26m}Al, ^{34}Cl, ^{38m}K: precision measurements with isotope-separated samples. V.T.Koslowsky, E.Hagberg, J.C.Hardy (Phys. Dept., Univ. of Toronto, Toronto, Ontario, Canada), R.E.Azuma, E.T.H.Clifford, H.C.Evans, H.Schmeing, U.J.Schrewe, K.S.Sharma.
Nucl. Phys. A (Netherlands), vol.A405, no.1, p.29-39 (22 Aug. 1983).
The half-lives of ^{26m}Al, ^{34}Cl and ^{38m}K have been measured with isotopically pure samples prepared with an on-line isotope separator. Emitted β^+ particles were observed with a large-solid-angle, high-efficiency, low-background gas proportional counter, from which signals were multiscaled. The counting electronics had a well-defined non-extendable dead time. Each sample decay curve was individually corrected for dead time before being summed with other accumulated data, no pile-up corrections being necessary. The analyis procedure was tested on hypothetical data. The effect of contaminant isobars on the resultant half-lives has been investigated. Half-life results are ^{26m}Al: 6346.2 ± 2.6 ms, ^{34}Cl: 1527.7 ± 2.2 ms and ^{38m}K: 924.2 ± 0.3 ms. The quoted uncertainties include—for the first time—explicit provision for all possible contaminants. (28 refs.)

99548 The shape of the beta strength function and consequences for nuclear physics and astrophysics. H.V.Klapdor (Max-Planck-Inst. fur Kernphys., Heidelberg, Germany).
Prog. Part. & Nucl. Phys. (GB), vol.10, p.131-225 (1983).
Discusses the structure of the beta strength function and how it affects nuclear physics and astrophysics. Topics covered include beta decay of nuclei far from stability, beta delayed fission, transuranic element production, double beta decay, reactor physics, the r-process, stars and galactic and solar neutrinos. (462 refs.)

99549 The reliability of nuclear model predictions of β-decay properties of nuclei far from stability. K.-L.Kratz (Inst. fur Kernchem., Univ. Mainz, Mainz, Germany).
Z. Phys. A (Germany), vol.312, no.3, p.263-4 (1983).
Reliable predictions of β-decay properties of nuclei far from stability require the knowledge of the detailed β-strength function, $S_\beta(E)$. This latter quantity corresponds to the energy distribution of the reciprocal ft-value and is usually defined in terms of the reduced Gamow-Teller (GT) transition probability $B'(GT)=6260\ (g_V/g_A)^2/ft$. The author reviews various nuclear model and compares them with experiment. (13 refs.)

99550 New beta-delayed proton emitters in the lanthanide region. J.M.Nitschke, M.D.Cable (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA), W.-D.Zeitz.
Z. Phys. A (Germany), vol.312, no.3, p.265-6 (1983).
Several new beta-delayed proton emitters have been observed at the on-line mass separator OASIS. They were previously identified as: ^{125}Ce ($8.9+0.7$ s), ^{126}Pr (3.2 ± 0.6 s), ^{127}Nd (1.9 ± 0.4 s), ^{128}Nd (4 ± 2 s), ^{137}Gd (7 ± 3 s), ^{139}Gd (4.9 ± 1 s), and ^{143}Dy (4.1 ± 0.3 s). 24.00 NUCLEAR REACTIONS AND SCATTERING: GENERAL

24.10 NUCLEAR REACTION AND SCATTERING MODELS AND METHODS

99552 The $^4He(\pi^-,n)^3H$ reaction in a Δ-hole model. M.Hirata (Dept. of Phys., Hiroshima Univ., Hiroshima, Japan), K.Masutani, A.Matsuyama, K.Yazaki.
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.15-18 (18 Aug. 1983).
The $^4He(\pi^-,n)^3H$ reaction in the resonance region is studied within the framework of the Δ-hole model. The basic mechanism of the pion absorption is assumed to be the $\Delta N \rightarrow NN$ transition and the interaction parameters for this transition are determined through the analysis of the $d(\pi^+,p)p$ reaction. The present model is found to describe the main features of the observed cross sections for the $^4He(\pi^-,n)^3H$ reaction, although it fails to explain the details of the angular distribution. (9 refs.)

99553 A possible modification of the Koonin formula of two-proton interferometry including an effect of two-proton clusters with a short range correlation. M.Biyajima (Dept. of Phys., Faculty of Liberal Arts, Shinshu Univ., Matsumoto, Japan).
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.24-8 (18 Aug. 1983).
By taking the two-proton (pp) clusters with a short range correlation (δ_c=0.6-0.7 fm) into account, which is useful in explaining the cumulative effects of backward pions and backward protons produced in hadron-nucleus collisions, Koonin's original (1977) pp interferometry formula can be modified. A comparison of the data in a ^{12}C collision at 40 GeV/c and an Ar+KCl collision at 1.8 GeV/c with the new modified Koonin formula is made. A small interaction size obtained in a previous analysis for the latter collision changes. (19 refs.)

99554 A note on some problems in transfer calculations. J.Bang (Niels Bohr Inst., Univ. of Copenhagen, Copenhagen, Denmark), A.M.Popova.
Z. Phys. A (Germany), vol.312, no.3, p.185-94 (1983).
Some principal questions of the theory of multiparticle transfer reactions are studied in the framework of Fredholm type equations. Expressions are compared to those of the distorted wave Born or coupled reaction channel approximations. (10 refs.)

99555 Quasi-elastic reaction cross sections. W.Westmeier, U.Brosa (Philipps-Univ., Marburg, Germany).
Z. Phys. A (Germany), vol.312, no.3, p.261-2 (1983).
Starting from the idea that a critical phenomenon separates deep-inelastic from quasi-elastic reactions, the authors introduce a simple procedure to calculate quasi-elastic cross sections. The results are compared with experimental data. (14 refs.)

24.10H Optical and diffraction models

99556 High energy hadron-nucleus diffraction scattering and nuclear structure. K.Takabayashi, M.Yonezawa (Dept. of Phys., Hiroshima Univ., Hiroshima, Japan).
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.169-71 (28 July 1983).
Two possible effects are suggested at high energy hadron-nucleus diffraction scattering if the nucleus behaves as a composite system of continuous (big-drop) or discrete non-nucleonic constituents. One is the appearance of the secondary dip in hadron-deuteron elastic differential cross sections and another is a small shadowing (eclipse) effect in the total cross section or even an antishadowing effect in light nuclei. (11 refs.)

24.60 STATISTICAL THEORY AND FLUCTUATIONS

99558 On the distribution of the fluctuating reaction cross section. H.Witala, L.Jarczyk, A.Strzalkowski (Inst. of Phys., Jagellonian Univ., Cracow, Poland), J.Lang, R.Muller.
Acta Phys. Pol. B (Poland), vol.B14, no.7, p.555-60 (July 1983).
Exact formula for the statistical distribution function of the fluctuating cross section is presented. Comparison with the results obtained from the approximate formula shows that such a formula can be used for calculation of the cumulative distribution function in the range of its values from 0.01 to 0.99. (7 refs.)

99559 Systematics of the effective ratio $\langle\Gamma_n/\Gamma_f\rangle$ of neutron emission and fission partial widths for transcurium nuclei. E.A.Cherepanov (JINR, Dubna, USSR), A.S.Iljinov, M.V.Mebel.
J. Phys. G (GB), vol.9, no.8, p.931-8 (Aug. 1983).
The ratios of neutron emission to fission partial widths averaged over the evaporation cascade, $\langle\Gamma_n/\Gamma_f\rangle$, are obtained from an analysis of the experimental cross sections of (HI, xn) reactions. The dependences of $\langle\Gamma_n/\Gamma_f\rangle$ on the excitation energy, E^*, angular momentum, I, and the number of neutrons emitted, x, are determined in the framework of the statistical model of the decay of excited nuclei. Using these dependences, the experimental data are analysed and the semi-empirical systematics of $\langle\Gamma_n/\Gamma_f\rangle$ are obtained. The dependence of the ratio $\langle\Gamma_n/\Gamma_f\rangle$ on the nucleon composition of the nucleus is considered in the framework of the liquid-drop model. (18 refs.)

99560 Statistical simulation of complete events in energetic nuclear collisions. G.Fai, J.Randrup (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
Nucl. Phys. A (Netherlands), vol.A404, no.3, p.551-77 (15 Aug. 1983).
A statistical model is developed for the generation of complete multifragment events in medium-energy nuclear collision. Based on simple geometrical considerations, the collision system is divided into a few (participant/spectator) sources that disassemble independently. The sufficiently excited sources quickly explode into pions, nucleons, and composite, possibly particle unstable, nuclei. The different final states compete according to their microcanonical weight. The less excited sources, and the unstable explosion products, deexcite by sequential light-particle emission. The model has been implemented as a Monte Carlo computer code that is sufficiently efficient to permit generation of large event samples. The analysis of such multifragment events is addressed and some illustrative aplications are discussed. (18 refs.)

99561 Measure of absorption in multistep compound processes. B.V.Carlson, M.S.Hussein (Inst. de Fisica, Univ. de Sao Paulo, Sao Paulo, Brazil).
Rev. Bras. Fis. (Brazil), vol.12, no.4, p.627-38 (Dec. 1982).
The Moldauer-Simonius theorem (1975) that relates the modulus of the determinant of the average, optical, S-matrix to the average width and spacing of the compound nucleus resonances is generalized to the multiclass resonances situation encountered in preequilibrium reactions. Corrections to the generalized M/S theorem are seen to be connected primarily to the width distribution of the widest doorway class. (14 refs.)

25.20 PHOTONUCLEAR REACTIONS AND PHOTON SCATTERING

99562 Removal of interference effect in the calculation of photonuclear cross-sections. M.H.Ahsan, N.Dytlewski, S.A.Siddiqui, H.H.Thies (Univ. of Western Australia, Nedlands, Australia).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.333-5 (1 July 1983).
The unmodified calculation of high resolution photonuclear cross-sections obtained with quasi-monochromatic photons, using bremsstrahlung, can result in an apparent 'interference effect' in narrow resonances. A simple method is described which eliminates this effect. (8 refs.)

99563 Structure effects in the ^{4}He(γ,p)^{3}H E2 cross section. J.J.Bevelacqua (US Dept. of Energy, Oak Ridge, TN, USA).
J. Phys. G (GB), vol.9, no.8, p.895-9 (Aug. 1983).
The ^{4}He(γ,p)^{3}H E2 cross section is calculated for $E_p{}^{CM} \leq 34$ MeV within the framework of the generalised R-matrix methodology of Lane and Robson (1966, 1969). The model suggests that three cross section peaks occur within this energy range. The first two peaks, at $E_p{}^{CM}=13.6$ and 22.5 MeV, correspond roughly to the 2^+ levels of Fairman and Meyerhof (1973) and McBroom et al. (1980). However, the third peak, at $E_p{}^{CM}=30.5$ MeV, does not correspond with any known 2^+ level. The existing data show considerable scatter and are not sufficiently detailed to confirm the predictions of the model. (28 refs.)

25.30 LEPTON-INDUCED REACTIONS AND SCATTERING

99564 Pion electroproduction from $_1{}^1$H and $_1{}^2$H near threshold. E.T.Dressler (Dept. of Phys., Pennsylvania State Univ., Abington, PA, USA).
Can. J. Phys. (Canada), vol.61, no.8, p.1227-30 (Aug. 1983).
The differential cross sections for $_1{}^1$H(e,π^+)e′,n and $_1{}^2$H(e,π^+)e′,2n are calculated and compared with some recent data (Caplan and Sealock, manuscript in preparation). The theoretical model in this calculation uses essentially the same approximations as were used by Dressler et al. (1979) for the $_1{}^2$H(γ,π^+)2n total threshold cross section. The results of this new calculation are in good agreement with the $_1{}^1$H(e,π^+)e′,n data. However, comparing the author's results to the $_1{}^1$H/$_1{}^2$H data at an incident electron energy of 200 MeV and a pion energy of 15 MeV seems to indicate that the $_1{}^2$H(eπ^+)e′,2n calculation somewhat overestimates this cross section. (8 refs.)

99565 On the non-relativistic approach to elastic ed scattering and the dependence on nucleon form factors. I.I.Belyantsev, V.K.Mitrjushkin, P.K.Rashidov, S.V.Trubnikov (Lab. of Theoretical Phys., JINR, Moscow, USSR).
J. Phys. G (GB), vol.9, no.8, p.871-83 (Aug. 1983).
The predictions of non-relativistic theory for elastic ed scattering with a recent version of the Paris potential and using the modified dispersion approach for the deuteron electromagnetic form factors, polarisation vector and tensor are studied. The dependence of all the quantities mentioned above on the choice of the nucleon form factor, in particular of the least known neutron electric form factor, is analysed. It is shown that a good description of the experimental data on elastic deuteron form factors up to $Q^2 \leq 8$ $(\mathrm{GeV}/c)^2$ may be obtained within the framework of a purely non-relativistic approach. Moreover, the values $G_{En}(Q^2)$ extracted from the data on elastic ed scattering at small Q^2 lead to good agreement between theory and experiment for the magnitude of the slope at zero $G_{En}'(0)$. The importance of polarisation experiments in elucidating the role of relativistic effects, the contribution of 6q states, etc., are discussed. (54 refs.)

99566 Form factor of the M1 transition to the 10.23 MeV state in ^{48}Ca and the role of the Δ(1232). W.Steffen, H.-D.Graf, A.Richter (Inst. fur Kernphys., Tech. Hochschule Darmstadt, Darmstadt, Germany), A.Harting, W.Weise, U.Deutschmann, G.Lahm, R.Neuhausen.
Nucl. Phys. A (Netherlands), vol.A404, no.3, p.413-27 (15 Aug. 1983).
The form factor of the 10.23 MeV 1^+ state in ^{48}Ca has been measured by inelastic electron scattering up to a momentum transfer of 1.4 fm^{-1}. The state is known to have a relatively simple shell-model structure. The shell-model calculation is, however, in severe disagreement with the data. The authors have attempted to analyse this discrepency in terms of non-nucleonic degrees of freedom. The mechanism of a Δ-hole polarization is important for the reduction of the form factor at low q if the Δ-hole interaction is sufficiently strong. The remaining quenching may be attributed to nucleonic core polarization while corrections from meson-exchange currents turn out to be small. (31 refs.)

99567 DWIA calculations of proton momentum distributions in ^{12}C and ^{16}O(e,e′p) reactions. V.P.Berezovoj, Yu.P.Mel'nik, A.V.Shebeko (Inst. of Phys. & Technol., Ukrainian Acad. of Sci., Kharkov, Ukrainian SSR).
Nucl. Phys. A (Netherlands), vol.A404, no.3, p.443-55 (15 Aug. 1983).
The DWIA analysis of the quasi-free (e,e′p) process on ^{12}C and ^{16}O has been performed within the framework of the single-particle shell model. The spherical Hartree-Fock wave functions for the effective Skyrme forces are used in describing the ground-state properties of these nuclei. The competition between the structure effects and the final proton-nucleus interaction in forming the momentum distributions of outgoing protons is studied in a wide range of recoil momenta (up to 3 fm^{-1}). The distorting optical potential has been calculated on the basis of the Watson multiple scattering theory. The results of the analysis are compared with the new data obtained at Saclay. (51 refs.)

99568 Electro-disintegration of ^{2}H with polarised beam and target. C.Y.Cheung, R.M.Woloshyn (TRIUMF, Vancouver, BC, Canada).
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.147-50 (28 July 1983).
The asymmetry with respect to change in sign of the electron longitudinal polarization is calculated for the exclusive ^{2}H(e,e′n)p and inclusive ^{2}H(e,e′)X reactions on a polarised deuteron target. The sensitivity to the neutron electric form factor is discussed. (8 refs.)

25.40 NUCLEON-INDUCED REACTIONS AND SCATTERING

(see also 28.20 Neutron physics)

99569 High energy proton interactions with Sr and Cs: a contribution to the waste transmutation study. P.De Felice, R.Ocone, A.Rindi (Lab. Nazionali di Frascati, NFN, Frascati, Italy), J.Tuyn, R.Deltenre, G.Roubaud.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.359-65 (1 July 1983).
The authors studied the production of stable and radioactive isotopes by irradiation of ^{90}Sr and ^{137}Cs in high energy particle beams. A fast computer program has been written which follows the yield of the various nuclides through successive transmutation and decay processes. The cross sections for the high energy reactions were calculated using semiempirical equations. Samples of Sr and Cs have been exposed to a 600 MeV proton beam. The comparison of experimental and theoretical results confirms the validity of the semiempirical formulas as well as of the transmutation code. This work is a contribution to the study of the scientific feasibility of using charged particle beams for transmutation to reduce the radioactivity of high level nuclear waste materials. (7 refs.)

99570 Disintegration of carbon-12 with 7.1-20.1 MeV neutrons in dielectrics. A.Aframian (Atomic Energy Organization of Iran, NRC, Tehran, Iran).
J. Phys. G (GB), vol.9, no.8, p.985-94 (Aug. 1983).
The intrinsic scattering of neutrons by carbon and its disintegration modes resulting in single and multiple ^{4}He emissions have been studied using discrete neutron energies in the dielectric nuclear track detector (DNTD), CA80-15, $(C_6H_8O_9N_2)_n$. Ranges and space angles of the triply formed α particles have been measured yielding energy-dependent cross sections. Alternatively, the detector can also be used as a high-energy neutron dosimeter and spectrometer. (20 refs.)

99571 Systematic study on the elastic scattering of 65 MeV polarized protons. H.Sakaguchi (Dept. of Phys., Kyoto Univ., Kyoto, Japan).
Mem. Fac. Sci. Kyoto Univ. Ser. Phys. Astrophys. Geophys. Chem. (Japan), vol.36, no.2, p.305-41 (March 1983). In Japanese.
Elastic scattering of 65 MeV polarized protons from 25 nuclei (^{16}O-^{209}Bi) has been measured. Systematics of the optical potential, which reproduces both the analyzing power and the differential cross section data remarkably, was persued. The volume integral of the real central part of the optical potential (J_R) shows a behavior similar to the binding energy curve for the target mass number. The mean square radius of the real central part of the optical potential is found to obey the relation $\langle r^2\rangle_{pot}=(0.937\pm0.012)A^{2/3}+(6.42\pm0.21)$ fm^2. By comparing with the systematics of the charge distributions obtained from electron scattering data, it is found that the effective two-body interaction range between an incident proton and a nucleon in the target has a target mass number dependence given by $\langle r^2\rangle_{int}=(0.132\pm0.013)A^{2/3}+(4.24\pm0.24)$ fm^2. Assuming this relation, root mean square radii of the point nucleon distributions are obtained. (48 refs.)

99572 Antiproton nuclear scattering in a microscopic potential model. J.A.Niskanen, A.M.Green (Res. Inst. for Theoretical Phys., Univ. of Helsinki, Helsinki, Finland).
Nucl. Phys. A (Netherlands), vol.A404, no.3, p.495-508 (15 Aug. 1983).
The authors derive an energy-dependent optical potential for $\bar{p}$ scattering on ^{12}C, ^{16}O, ^{32}S and ^{40}Ca. Using this they calculate the elastic scattering differential cross section and the absorption cross section at the laboratory energies 35 MeV, 75 MeV and 130 MeV (and for ^{40}Ca also at 200 MeV). Even though the model dependence of the elastic cross sections is non-negligible, the absorption cross sections are, in fact, practically independent on the model. A comparison is made with the rather meagre experimental data at 118 MeV and 174 MeV. (20 refs.)

99573 Multiparticle production in pTa interactions at 8 GeV/*c*. N.Fujiwara, S.Noguchi, M.Kohriki, S.Yamashita (Dept. of Phys., Nara Women's Univ., Nara, Japan).
Nucl. Phys. A (Netherlands), vol.A404, no.3, p.509-24 (15 Aug. 1983).
pTa interactions have been studied. The total inelastic cross section, multiplicities, net charge distributions and inclusive momentum and rapidity spectra for produced particles are reported. The correlations between fast and slow particles are presented and the reaction mechanisms for multiparticle production in pTa interactions are discussed. (16 refs.)

99574 Isobaric analogue resonances in the ^{41}K and ^{65}Cu(p,n) reactions. S.Saini, G.Singh, A.Chatterjee, S.Kailas, D.D.Karnik, N.Veerabahu, M.K.Mehta (Nuclear Phys. Div., Bhabha Atomic Res. Centre, Bombay, India).
Nucl. Phys. A (Netherlands), vol.A405, no.1, p.55-68 (22 Aug. 1983).
The total (p,n) reaction cross sections for ^{41}K and ^{65}Cu have been measured as a function of proton energy in the energy ranges 1.46-4.10 and 2.25-4.20 MeV, respectively. Several prominent isobaric analogue resonances have been identified. A detailed shape analysis of these isobaric analogue resonances has been performed to determine the proton width Γ_p, the spreading width W and the spectroscopic factor S_n for the various resonances. (27 refs.)

99575 Resonant charged particle emission from ^{11}B+p and ^{12}C states at E$_x$=20-23 MeV. F.Borchers, H.de Jong, J.Krug, E.Kuhlmann (Inst. fur Experimentalphys. I, Ruhr-Univ. Bochum, Bochum, Germany).
Nucl. Phys. A (Netherlands), vol.A405, no.1, p.141-58 (22 Aug. 1983).
Absolute differential cross sections of the reactions ^{11}B(p,p$_i$)^{11}B(i), i=0-3, and ^{11}B(p,α_0)^{8}Be have been measured at about 20 angles for up to 37 bombarding energies E_p=4.5-7.5 MeV corresponding to excitation energies E$_x$(^{12}C)=20.1-22.8 MeV. Several compound resonances are observed for which from their angular distributions the following spin and parity assignments were derived: E_x=20.25 MeV ($J^\pi=1^+$), 20.63 (3^-), 21.52 (3^-), 21.99 (1^-), and 22.47 (3^-). The positions and widths of the resonances were determined by R-matrix formulae. In all cases the sum of the proton partial widths virtually exhausts the total width indicating dominant 1p1h configurations. The resonances at 20.25, 20.63 and, tentatively, 21.99 MeV are identified to be the $T_z=0$ analog states of low-lying $T=1$ multiplets. A strong $J^\pi=2^+$ background was found throughout the whole energy range which was taken to be the low-energy tail of the isoscalar giant quadrupole resonance. (37 refs.)

99576 Improved experimental test of detailed balance and time reversibility in the reactions ^{27}Al+$p\rightleftharpoons^{24}$Mg+α. E.Blanke, H.Driller, W.Glockle (Abteilung fur Phys. und Aastron., Ruhr Univ. Bochum, Bochum, Germany), H.Genz, A.Richter, G.Schrieder.
Phys. Rev. Lett. (USA), vol.51, no.5, p.355-8 (1 Aug. 1983).
A new test of the principle of detailed balance in the nuclear reactions ^{27}Al(p,α_0)^{24}Mg and ^{24}Mg(α,p_0)^{27}Al at bombarding energies 7.3 MeV$\leq E_p\leq$7.7 MeV and 10.1 MeV$\leq E_\alpha\leq$10.5 MeV, respectively, is reported. Measured relative differential cross sections agree within the experimental uncertainty $\Delta=\pm0.51\%$ and hence are consistent with time-reversal invariance. From this result an upper limit $\xi\leq5\times10^{-4}$ (80% confidence) is derived for a possible time-reversal-noninvariant amplitude in the reaction. (17 refs.)

99577 Neutron pick-up (n,^{2}n*) reaction. M.Zadro, D.Miljanic (Ruder Boskovic Inst., Zagreb, Yugoslavia).
Z. Phys. A (Germany), vol.312, no.3, p.257-8 (1983).
Direct ^{2}n* contributions (^{2}n*-singlet n-n final state interaction) to the (n,2n) reaction cross sections are estimated. (11 refs.)

99578 On the mechanism of inclusive particle emission in proton-nucleus collisions at 0.5 GeV. S.G.Mashnik (Inst. of Appl. Phys., Acad. of Sci., Kishinev, USSR), S.Tesch.
Z. Phys. A (Germany), vol.312, no.3, p.259-60 (1983).
A cascade-exciton model is used to describe the backward particle emission from proton-nucleus collisions at medium energies. A good agreement with data at 0.5 GeV is obtained. (5 refs.)

25.50 ^{2}H- AND ^{3}H-INDUCED REACTIONS AND SCATTERING

99579 Tensor analysing power of (d,^{3}He) and (d,t) reactions and the D-state of the tri-nucleon system. F.Entezami, J.D.Brown, J.M.Barnwell, K.S.Dhuga, O.Karban, J.M.Nelson, S.Roman (Dept. of Phys., Univ. of Birmingham, Birmingham, England).
Nucl. Phys. A (Netherlands), vol.A405, no.1, p.69-87 (22 Aug. 1983).
Tensor analysing powers of the (d,^{3}He) reaction on ^{19}F, ^{45}Sc, ^{63}Cu, ^{64}Zn and (d,t) reaction on ^{63}Cu and ^{64}Zn have been measured at 12.4 MeV incident deuteron energy. The results were compared with the DWBA theory including the D-state term in the tri-nucleon wave function expressed by the D_2 parameter. The χ^2 criterion was applied to determine the value of the D_2 parameter. The effect of the tensor spin-orbit term T_R in the deuteron optical potential was investigated. The inclusion of the T_R term lowers the magnitude of the 'best fit' D_2 value in all cases and the results for (d,t) and (d,^{3}He) are very similar and in accordance with recent theoretical estimates. (39 refs.)

99580 Scattering and break-up of deuterons on α-particles in a realistic three-body model. J.Bang (The Niels Bohr Inst., Univ. of Copenhagen, Copenhagen, Denmark), J.-J.Benayoun, C.Gignoux, I.J.Thompson.
Nucl. Phys. A (Netherlands), vol.A405, no.1, p.126-40 (22 Aug. 1983).
Deuteron-α scattering with n,p break-up is calculated in a three-body model with local interactions. The exclusion principle is taken into account in an approximate way. (14 refs.)

99581 A study of the ^{6}Be system by use of the reaction $^3\vec{\text{H}}$e(^{3}He,p)^{5}Li(g.s.) between 17 and 30 MeV with a polarized target. U.Kirchner, R.Beckmann, U.Holm, H.-G.Korber (Inst. fur Experimentalphys., Univ. Hamburg, Hamburg, Germany).
Nucl. Phys. A (Netherlands), vol.A405, no.1, p.159-69 (22 Aug. 1983).
The differential cross section of the reaction ^{3}He(^{3}He,p)^{5}Li(g.s) has been measured at 26 MeV and the analyzing power A_y in the energy range 17-30 MeV with the use of a polarized ^{3}He target. The data are compared with existing microscopic multi-channel calculations to the ^{6}Be system. The influence of the $J^\pi=4^+$ channels turned out to be too strong. The deviations from the antisymmetry to 90° c.m. of the analyzing power angular distribution $A_y(\theta)$ are discussed with respect to the purely direct transfer model for identical particles in the entrance channel. (22 refs.)

Nuclear spectroscopy of ^{90}Y .... See Entry 99504

25.60 ^{3}HE- AND ^{4}HE-INDUCED REACTIONS AND SCATTERING

99582 Time-dependent variational description of $\alpha\alpha$ scattering. M.Saraceno (Dept. de Fisica, CNEA, Buenos Aires, Argentina), P.Kramer, F.Fernandez.
Nucl. Phys. A (Netherlands), vol.A405, no.1, p.88-108 (22 Aug. 1983).
The time-dependent variational principle is applied to the simple but quite realistic situation of $\alpha\alpha$ scattering. The effects of antisymmetrization are included and the authors show that they lead to a change in the structure of the phase space of relative motion. The main new feature is the appearance of forbidden regions in the phase space which have, in the quantum treatment, a close connection with states excluded by the Pauli principle. The elastic phase shifts are evaluated semiclassically in the distorted phase space and compared to a quantum calculation by the resonating group method. (33 refs.)

99583 Excitation and decay of $\Delta L=1$ modes in ^{12}N via the ^{12}C(^{3}He,tp) reaction. W.A.Sterrenburg, M.N.Harakeh, S.Y.Van der Werf, A.Van der Woude (Kernfysisch Versneller Instituut, Groningen, Netherlands).
Nucl. Phys. A (Netherlands), vol.A405, no.1, p.109-25 (22 Aug. 1983).
A study of the nucleus ^{12}N has been performed using the ^{12}C(^{3}He,t) reaction at bombarding energies of 75 and 81 MeV. Differential cross sections were measured and interpreted using an effective projectile-nucleon interaction and microscopic wave functions. Proton decay to final states in ^{11}C was measured by recording coincidences tritons emitted at 0° and protons detected at several backward angles. From the triton angular distributions and the triton-proton angular correlations strong suggestions can be made about the location of $J^\pi=2^-$, 1^- and 0^- strengths in ^{12}N. The $\Delta L=1$ strength distributions are compared with the results of shell-model calculations. (25 refs.)

99584 A separable potential and off-shell scattering amplitude for an α-Λ interaction. S.Oryu, R.Kircher (Dept of Phys., Sci. Univ. of Tokyo, Noda, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.5, p.1673-6 (May 1983).
A separable potential of low rank is derived from a local α-Λ potential for the $S_{1/2}$-wave. This separable potential reproduces the bound state and the scattering wave functions of a given nonseparable α-Λ interaction with high accuracy. In addition, the off-shell T-matrix and the off-shell scattering amplitude have been calculated on the basis of the form factors of the separable potential. (14 refs.)

25.70 HEAVY ION INDUCED REACTIONS AND SCATTERING

99585 ^{58}Ni(^{16}O,^{12}C)^{62}Zn reaction at an incident energy 80 MeV. Y.Okuma (Res. Center for Nuclear Phys., Osaka Univ., Osaka, Japan), T.Motobayashi, K.Takimoto, S.Shimoura, K.Ogino, M.Fukada, T.Suehiro, S.Matsuki, T.Yanabu.
Bull. Inst. Chem. Res. Kyoto Univ. (Japan), vol.61, no.1, p.12-29 (March 1983).
Cross section angular distributions for the ^{16}O+^{58}Ni elastic scattering and the ^{58}Ni(^{16}O,^{12}C)^{62}Zn-3.8416 MeV reaction leading to the discrete and continuum states at an incident energy E$_{lab}$(^{16}O)=80 MeV have been measured. The eight low-lying single and double energy levels were observed in the energy spectra of the ^{58}Ni(^{16}O,^{12}C)^{62}Zn reaction. Populations of these levels have the cross sections of 1-200 μb/sr. The total yield of the (^{16}O,^{12}C) reaction was enhanced in the particle-identification spectra of the ^{16}O induced reactions on ^{58}Ni. This is because the Q value of this reaction is negative but small. The g'nd state cross section was proved to change with the incident energy by comparing the present data with the other 46 and 60 MeV data. The cross section angular distribution for the g'nd state transition changes also with the incident energy. Optical model parameters were deduced from the best fit to the measurements of the ^{16}O+^{58}Ni elastic scattering. The EFR-DWBA calculations of the (^{16}O,^{12}C) results were performed with reasonable fits for the cross section angular distributions of observed energy levels. (45 refs.)

99586 Gauge invariance in heavy-ion collisions. D.H.Kobe, P.K.Kennedy (Dept. of Phys., North Texas State Univ., Denton, TX, USA).
J. Phys. B (GB), vol.16, no.15, p.L443-7 (14 Aug. 1983).
A manifestly gauge-invariant formulation of the Dirac equation for an electron in the electromagnetic field generated by two heavy ions is given, which used the eigenstates and eigenvalues of the gauge-invariant energy operator. Transitions between the energy eigenstates are induced by the power operator, not the vector potential. (16 refs.)

99587 Anharmonic vibration-rotation approach to quasimolecular spectra. N.Cindro (Rudjer Boskovic Inst., Zagreb, Yugoslavia), W.Greiner.
J. Phys. G (GB), vol.9, no.8, p.L175-9 (Aug. 1983).
A closed-form expression for the energies of known ^{12}C+^{12}C and positive-parity ^{12}C+^{16}O resonances was obtained assuming an anharmonic quadrupole vibration-rotation model for the colliding nuclei. The expression has a form identical to that obtained by Iachello (1981) on the basis of dipole vibrations; this result shows that the nature of the degrees of freedom dominating nuclear quasimolecules can also be well accounted for by quadrupole motion. The model describes the sequential deformation of the nuclear system before it breaks up into clusters; the strongly deformed nuclear shapes can be associated with nuclear isomerism. (7 refs.)

99588 Target dependence of ^{16}O-induced reactions at 20 MeV/A. A.Menchaca-Rocha (Inst. des Sci. Nucleaires, Grenoble, France), M.E.Brandan, R.Legrain, A.Dacal, A.Galindo.
J. Phys. G (GB), vol.9, no.8, p.L181-5 (Aug. 1983).
Projectile-like particle yields from ^{16}O-induced reactions at E_i=315 MeV have been measured for ^{12}C and ^{60}Ni targets and compared with those for

^{208}Pb. Factorisation for the relative yields is found to extend down to light targets. (13 refs.)

99589 **Search for a three-particle component of the $E_{CM}=11.1$ MeV 5^- resonance in the $^{12}C+^{16}O$ reaction.** H.U.Gersch, H.Schobbert, D.Wohlfarth (Zentralinst. fur Kernforschung, Rossendorf, Dresden, Germany).
J. Phys. G (GB), vol.9, no.8, p.939-46 (Aug. 1983).
The 11.1 MeV 5^- resonance in the $^{12}C+^{16}O$ reaction is remeasured and the position of the resonance is determined to be $E_x(^{28}Si)=(27.881\pm0.022)$ MeV. A kinematically complete study of the $^{12}C(^{16}O,\alpha^{12}C)^{12}C$ reaction into this resonance is carried out. Particle identification is based on the reaction kinematics. No evidence for a ^{12}C-α-^{12}C component of this resonance is found. (13 refs.)

99590 **The measurement of entry states in light nuclei.** R.Daniel, J.D.Burrows, P.A.Butler, J.R.Cresswell, A.D.Irving, D.J.G.Love, T.P.Morrison, P.J.Nolan, J.F.Sharpey-Schafer (Oliver Lodge Lab., Univ. of Liverpool, Liverpool, England).
J. Phys. G (GB), vol.9, no.8, p.947-60 (Aug. 1983).
Gamma-ray and charged-particle emission have been studied following the bombardment of ^{28}Si and ^{32}S with 40 MeV ^{16}O ions and of ^{58}Ni with 55 MeV ^{16}O ions. The locus of states populated by particle evaporation and depopulated by γ emission (entry line) has been studied in the 2p channel for each of these reactions by measuring the mean γ-ray multiplicity and total proton kinetic energy. The moments of inertia for ^{46}Ti and ^{72}Se are deduced from the slope of the entry line. The data are compared with statistical-model calculations and show good agreement. (15 refs.)

99591 **On the influence of shell structure in dissipative collisions.** K.D.Hildenbrand, H.Freiesleben, A.Gobbi, U.Lynen, A.Olmi, H.Sann, E.C.Wu (Gesellschaft fur Schwerionenforschung, Darmstadt, Germany).
Nucl. Phys. A (Netherlands), vol.A405, no.1, p.179-204 (22 Aug. 1983).
A kinematically complete study of the symmetric systems $^{144}Sm+^{144}Sm$ and $^{154}Sm+^{154}Sm$ has been performed at energies 30% in excess of the interaction barrier. They have been chosen because of their different internal structure: ^{144}Sm has a closed $N=82$ neutron shell and a spherical ground-state configuration; ^{154}Sm with ten neutrons outside this shell is strongly deformed. The observed gross features of both reactions like energy, angular and total mass or element distributions are very similar; the ratio of the mass variances as function of the total kinetic energy loss indicates the number of exchanged nucleons to be comparable in all stages of the reactions. At small energy losses, however, the element distributions of the $^{144}Sm+^{144}Sm$ reaction are considerably broader, pointing at an enhanced proton transfer at the cost of the number of exchanged neutrons in this system. This observation is attributed to the influence of the closed shell which seems to block the transfer of neutrons at low excitation energies. These results can be explained quantitatively by the different gradients of the shell-corrected potential energy surfaces of the two systems. (43 refs.)

99592 **Search for short-lived anomalons in projectile fragmentation.** H.A.Gustafsson, H.H.Gutbrod, B.Kolb, B.Ludewigt, A.M.Poskanzer, T.Renner, H.Riedesel, H.G.Ritter, A.I.Warwick, H.H.Wieman (Gesellschaft fur Schwerionenforschung, Darmstadt, Germany).
Phys. Rev. Lett. (USA), vol.51, no.5, p.363-5 (1 Aug. 1983).
An anomalous short mean free path for projectile fragments has been observed in emulsions. The effect disappears in the first few centimeters and it has been suggested that the disappearance is due to a lifetime effect. The projectile fragmentation yields from a solid and a dilute Cu target bombarded by 1.7-Gev/u ^{56}Fe have been measured and it is concluded that the disappearance of the effect is not due to decay. (5 refs.)

99593 **Molecular interpretation of the neutron transfer in the reaction $^{13}C(^{13}C,^{12}C)^{14}C$ within the two-center shell model.** R.Konnecke, W.Greiner (Inst. fur Theoretische Phys., Johann-Wolfgang-Goethe-Univ., Frankfurt-am-Main, Germany), W.Scheid.
Phys. Rev. Lett. (USA), vol.51, no.5, p.366-9 (1 Aug. 1983).
On the basis of the two-center shell model a molecular reaction theory is applied to the reaction $^{13}C(^{13}C,^{12}C)^{14}C$. Prominent structures in the measured differential cross sections can be reproduced by this theory. (13 refs.)

99594 **General characteristics of the forward glory energy oscillations in heavy ion scattering.** M.S.Hussein (Dept. of Phys., MIT, Cambridge, MA, USA).
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.165-8 (28 July 1983).
Analytic expressions are derived for the period and amplitude of the energy oscillations associated with nuclear forward glory scattering. It is found that the amplitude increases with energy as $E^{1/4}$ whereas the period behaves approximately as $E^{3/2}/\ln E$. Several numerical examples are worked out. (11 refs.)

99595 **Complete fusion in peripheral collisions observed in the reaction ^{16}O on ^{146}Nd at 10 MeV/u.** H.Oeschler, M.Kollatz (Tech. Hochschule Darmstadt, Darmstadt, Germany), W.Bohne, K.Grabisch, H.Lehr, H.Freiesleben, K.D.Hildenbrand.
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.177-80 (28 July 1983).
It is experimentally well established that the nucleus ^{162}Er is stable against fission for spins below 65 ħ. The observation of fission in the reaction ^{16}O on ^{146}Nd proves therefore that compound nuclei have been formed with spins beyond this value via complete fusion as in the competing process of incomplete fusion with ^{12}C originating from ^{16}O break-up states with spins below 55 ħ in ^{158}Dy are populated which are stable against fission. Complete fusion is found to occur for partial waves well above the critical l value. For these peripheral collisions complete and incomplete fusion seem to coexist. (11 refs.)

99596 **E_γ-E_γ correlations from partial fusion reactions.** H.Yamada, A.Ahmed, H.Banda, J.H.Hamilton, C.F.Maguire, R.B.Piercey, A.V.Ramayya (Dept. of Phys. & Astron., Vanderbilt Univ., Nashville, TN, USA), S.A.Hjorth, D.C.Hensley, J.D.Cole, G.A.Leander.
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.33-6 (18 Aug. 1983).
A partial fusion reaction, $^{154}Sm(^{14}N,(p,d,t)xn)^{157-159}Er$, is shown to be a viable alternative to heavier-ion complete fusion reactions for E_γ-E_γ correlation studies at very high spin. The valley observed in the present correlation plot, obtained with NaI detectors, indicates rotational band structure up to $E_\gamma\approx1.46$ MeV and a corresponding estimated spin of $I=48$. A numerical simulation of the experimental data to check the method shows the significance of this result. (16 refs.)

99597 **A possible explanation for the evidence of anomalously short mean free paths of projectile fragments from heavy-ion collisions.** E.S.Pshenin, V.G.Voinov (High Energy Phys. Inst., Kazakh Acad. of Sci., Alma-Ata, USSR).
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.133-6 (18 Aug. 1983).
In the last years many experiments with heavy-ion accelerator beams have been performed. Some of these experiments give evidence for anomalously short mean free paths (MFP's) of projectile fragments for the first few centimeters after the point of emission. The authors give the possible explanation of this effect based on the statistical bias of the estimate for the MFP used by experimenters. The unbiased estimate for the reciprocal of the MFP is presented. (9 refs.)

99598 **Heavy fragment energies and angular distributions in the reaction of 86 MeV/nucleon ^{12}C with medium-A targets.** A.Lleres, J.Blachot, J.Crancon, A.Gizon, H.Nifenecker (Dept. de Recherche Fondamentale, CENG, Grenoble, France).
Z. Phys. A (Germany), vol.312, no.3, p.177-84 (1983).
Using the thin target-thin catchers techniques, masses, mean recoil energies and angular distributions of target residues have been measured for 86 MeV/nucleon ^{12}C induced reactions. Several different nuclear reaction processes, from peripheral to central collisions have been observed. Experimental results are partly reproduced by intranuclear cascade+evaporation calculations. Up to now, the production of the lightest masses $(44<A<71)$ recoiling with high kinetic energies is not correctly understood by theoretical models. More exclusive experiments are needful to check if the formation of a highly excited quasi-compound nucleus could be a possible explanation of the phenomena. (19 refs.)

99599 **Emission of direct particles in heavy ions collisions.** H.Tricoire (Inst. de Phys. Nucleaire, Orsay, France).
Z. Phys. A (Germany), vol.312, no.3, p.221-32 (1983).
The author presents a theoretical model for the emission of fast light particles derived from the PEP (Promptly Emitted Particles) model. This model is extended to the emission of fast alpha particles. With some restrictions, analytical formulae are derived for the production rate and the mean angular momentum associated with fast particles. Most of the qualitative features predicted by the analytical formulae are confirmed by the numerical results obtained from a more realistic calculation where the trajectories of the particles are followed during the whole collision. It is argued that PEP alpha particles emitted preferentially in low angular momentum collisions, could represent the major part of the fast alpha particles observed in incomplete fusion reactions. (24 refs.)

25.80 MESON- AND HYPERON-INDUCED REACTIONS AND SCATTERING

99600 **Galileo-invariant theory of low energy pion-nucleus scattering. III. The π^--^4He reaction and light π-mesoatoms.** R.Mach (Inst. of Nuclear Phys., Czechoslovak Acad. Sci., Rez, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.7, p.772-86 (1983).
For pt.II, see ibid., vol.B33, no.6, p.616 (1983). Using two versions of the Galileo-invariant optical model, π^--^4He elastic scattering cross sections were calculated in the energy interval 50-260 MeV. Level shifts and widths of several light π-mesoatoms were estimated in the Born approximation. Whereas the $(A+1)$-body model appears to be more suitable in the resonance region the two-body model yields surprisingly good results for both the low-energy scattering and the characteristics of π-mesoatoms. (24 refs.)

99601 **A study of charge symmetry breaking effects in elastic $\pi^\pm d$ scattering.** A.S.Rinat, Y.Alexander (Weizmann Inst. of Sci., Rehovot, Israel).
Nucl. Phys. A (Netherlands), vol.A404, no.3, p.467-81 (15 Aug. 1983).
The authors computed external and internal Coulomb distortions as well as strong charge symmetry breaking (CSB) effects in $\pi^\pm d\rightarrow\pi^\pm d$. Available data for $T_\pi=143$ MeV indicate the presence of CSB on the level of observed and deduced parameters for different Δ-isobars and the pn mass difference. Data for $T_\pi\gtrsim180$ MeV are predicted to better suit the extraction of a measure of charge symmetry breaking. This note also contains a critical analysis of a previous study of CSB effects on $\sigma_{\pi d}{}^{tot}$. (19 refs.)

99602 **Inclusive reaction of nuclei induced by pions at intermediate energies.** J.Suzumura (Dept. of Phys., Sci. Univ. of Tokyo, Noda, Japan).
Prog. Theor. Phys. (Japan), vol.69, no.5, p.1669-72 (May 1983).
The dynamics of the two-nucleon absorption of pion in the reaction $\pi^\pm+A\rightarrow p+$anything at intermediate energies is investigated in the correlated pair model. The process is dominated by pion and ρ-meson exchange following Δ_{33} excitation. The role of the ρ-meson is shown to be crucial in reducing the contribution of pion exchange. (12 refs.)

25.85 FISSION REACTIONS

99603 **Angular momentum partition as a function of the mass asymmetry in heavy-ion induced fission.** F.A.Dilmanian, L.Grodzins, J.W.Ball, M.Beckerman, R.Boisseau, S.Gazes, R.Ledoux, A.Sperduto (Lab. for Nuclear Sci., MIT, Cambridge, MA, USA).
Phys. Lett. B (Netherlands), vol.127B, no.3-4, p.172-6 (28 July 1983).
Gamma ray multiplicities and angular distributions have been measured as functions of the mass asymmetry of the fission fragments for the reactions of 150-210 MeV ^{37}Cl beams with ^{107}Ag, and 150-210 MeV ^{32}S beams with ^{112}Cd. In all reactions, as the mass asymmetry increases the mean total gamma ray multiplicities decreases, the relative width of the multiplicity increases and the gamma ray anisotropy decreases. Thus the more asymmetric the mass splitting the smaller is the total spin of the fission fragments, and, probably, the total angular momentum of the compound system. (18 refs.)

99604 The spontaneous fission of ^{8}Be and the fusion at sub-Coloumb barrier energies in the time-dependent cluster theory. S.Drozdz (Inst. of Nuclear Phys., Cracow, Poland), J.Okolowicz, M.Ploszajczak.
Phys. Lett. B (Netherlands), vol.128B, no.1-2, p.5-8 (18 Aug. 1983).
The time-dependent cluster theory is applied for a description of the spontaneous fission of ^{8}Be and for a calculation of the α-α fusion cross section at sub-Coulomb barrier energies. The calculated spontaneous fission decay width $\Gamma^{(cal)} \simeq 7.5$ eV reproduces the experimental value $\Gamma^{(ex)} = 6.8 \pm 1.7$ eV. (12 refs.)

99605 Analysis and estimate of neutron cross sections of curium isotopes. T.S.Belanova.
Sov. At. Energy (USA), vol.53, no.6, p.841-8 (Dec. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.6, p.386-91 (Dec. 1982).
The presence of curium isotopes in power-reactor fuel creates many problems in reactor operation and design, in repeated fuel reprocessing and actinide waste disposal, and also in the production of transuranium elements. A quantitative estimate of the rate of buildup and decay of Cm nuclei requires data on the neutron capture and fission cross sections in both the resonance and thermal energy regions. The author attemps to systematize the published experimental data on neutron cross sections for Cm isotopes, and to estimate values at thermal and resonance energies. (37 refs.)

99606 Photoneutrons from thick D_2O, Be and Pb converters at $E_{max} = 15$ MeV. A.V.Drobinin, M.Leonard, Yu.M.Tsipenyuk.
Sov. At. Energy (USA), vol.53, no.6, p.858-61 (Dec. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.6, p.398-9 (Dec. 1982).
Neutron escape is one of the basic channels of an excited nucleus. Neutrons may be emitted at various stages in a nuclear reaction. The energy spectrum of the decay products from an intermediate or heavy nuclide is due, in the main, to the decay of the compound nucleus, but it also contains a high-energy component corresponding to the decay of the ingoing state into the continuum; part of the spectrum is due to the preequilibrium decay from more complicated configurations. The authors study the photoneutron spectra from D_2O, Be and Pb convertors at 15 MeV. (11 refs.)

25.88 FUSION REACTIONS

99607 Measurements of nuclear deexcitation times down to 10^{-19} sec using crystal blocking of ^{16}O on diamond. J.Gomez del Campo, D.Shapira, J.A.Biggerstaff, C.D.Moak, P.D.Miller, N.Neskovic (Oak Ridge Nat. Lab., Oak Ridge, TN, USA), R.W.Fearick, J.P.F.Sellschop.
Phys. Rev. Lett. (USA), vol.51, no.6, p.451-4 (8 Aug. 1983).
The crystal-blocking technique was used to measure the deexcitation times of the evaporation residues of 120-MeV ^{16}O on ^{12}C, emerging along the $\langle 110 \rangle$ axis of a 12-μm-thick diamond crystal. The extracted times ranged from 4×10^{-19} sec for Mg to 4×10^{-18} sec for N, and they are consistent with statistical-model predictions. (12 refs.)

28.00 NUCLEAR ENGINEERING AND NUCLEAR POWER STUDIES

(see also 86.10 Energy resources and their utilisation)

28.20 NEUTRON PHYSICS

(see also 25.40 Nucleon-induced reactions and scattering)

99608 Multiple scattering from an infinite plane slab. A.K.Soper (Los Alamos Nat. Lab., Los Alamos, NM, USA).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.337-47 (1 July 1983).
A straightforward iterative procedure is used to calculate multiple scattering from an infinite slab over a wide range of slab thicknesses. For thin slabs, the calculations agree well with earlier work. In particular, the author finds that the ratio of total scattered to primary scattered neutron currents for a thin slab is represented by the function $1/(1-\delta)$, where δ is the ratio of secondary to primary currents. For thick slabs, the results are compared with Monte Carlo simulations of polyethylene and iron. The agreement is generally good, but the method exaggerates the ability of polyethylene to attenuate 10 MeV neutrons. A model of two parallel slabs is used to discuss the reflectivity of the walls of a neutron collimator. (13 refs.)

99609 Slowing down of neutrons from a pulsed, point, monoenergetic source in a hydrogenous medium. R.Golub (Tech. Univ., Munchen, Garching, Germany), A.D.Taylor.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.349-57 (1 July 1983).
The authors present an approximate analytic solution for the distribution of neutrons from a pulsed, point source in an infinite hydrogenous medium. The solution is obtained in the diffusion approximation with the energy loss due to collisions with the hydrogen nuclei treated exactly. Their result is very close to the Age-Diffusion theory result. They then extend the method to apply to a point source surrounded by a bare spherical moderator and compare the results with those obtained from Monte Carlo (TIMOC) calculations and a steady state transport code (ANISN). (18 refs.)

99610 Spin-dependent scattering and absorption of thermal neutrons on dynamically polarized nuclei. H.Glattli, J.Coustham (IRF, CEN, Gif-sur-Yvette, France).
J. Phys. (France), vol.44, no.8, p.957-65 (Aug. 1983).
Dynamic nuclear polarization and the spin-temperature concept of nuclear Zeeman reservoirs are systematically used to obtain spin-dependent scattering lengths b_N of separate isotopes in the same target. A simple generalization shows the way to measure B_N for nuclei invisible by nuclear magnetic resonance. It shown also how to obtain precise ratios of b_N for different isotopes or of spin-dependent absorption and scattering of the same isotope. Values of b_N are given for ^{13}C, ^{35}Cl, ^{79}Br, ^{81}Br as well as upper limits for ^{31}P, ^{37}Cl and ^{41}K. (8 refs.)

99611 A solution of the neutron transport equation using spherical harmonics. J.K.Fletcher (UKAEA, Warrington, England).
J. Phys. A (GB), vol.16, no.12, p.2827-35 (21 Aug. 1983).
A solution of the neutron transport equation is obtained by expanding the flux $\Phi(r\Omega)$ at position r in direction Ω as a series of the form: $\Phi(r,\Omega)=\Sigma_{l=0}{}^N(2l+1)\Sigma_{m=0}{}^l P_l{}^m(\cos\theta)[\psi_{lm}\ (r)\cos(m\phi)+\gamma_{lm}(r)\sin(m\phi)]$ where $P_l{}^m(\cos\theta)$ is the associated Legendre polynomial of order l, m with θ and ϕ the axial and azimuthal angles, respectively, of Ω. $\psi_{lm}(r)$ and $\gamma_{lm}(r)$ satisfy first-order differential equations and are determined by eliminating terms with odd l and then using finite-difference or finite-element techniques on the resulting second-order system. Complicated algebra is involved in deriving this latter set of relations and FORTRAN subroutines have been written to calculate the necessary coefficients and specify the relevant differentials. (12 refs.)

99612 Neutron-transmission function for the region of unresolved resonances. A.V.Komarov, A.A.Luk'yanov.
Sov. At. Energy (USA), vol.53, no.6, p.849-53 (Dec. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.6, p.392-5 (Dec. 1982).
An important part in the urgent problem of increasing the accuracy of reactor-physics calculations is played by investigations of the resonant self-screening in the retardation, absorption, and diffusion of decelerating neutrons in reactor media. The most complete information of the peculiarities of this structure and its importance for the estimation of self-screening effects is given by experimental data on neutron transmission as a function of the sample thickness. The authors calculate the transmission function in the region of unresolved resonances using a model cross section corresponding to the case of identical equidistant resonances with mean resonant parameters. (24 refs.)

28.41 FISSION REACTOR THEORY AND DESIGN

99613 Verification and validation as an integral part of the development of digital systems for nuclear applications. E.A.Straker, N.C.Thomas.
Nucl. Saf. (USA), vol.24, no.3, p.338-51 (May-June 1983).
The nuclear industry's current attitude toward verification and validation (V&V) is realized through the experiences gained to date. On the basis of these experiences, V&V can effectively be applied as an integral part of digital system development for nuclear electric power applications. An overview of a typical approach for integrating V&V with system development is presented. This approach represents a balance between V&V as applied in the aerospace industry and the standard practice commonly applied within the nuclear industry today. (27 refs.)

99614 Physical characteristics of an RBMK reactor in the transitional period. V.S.Romanenko, A.V.Krayushkin.
Sov. At. Energy (USA), vol.53, no.6, p.816-24 (Dec. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.6, p.367-73 (Dec. 1982).
The authors present a rational method of neutron-physics calculation of transitional-period characteristics for an RBMK is described, the basic physical processes occurring in the reactor in this period are analyzed, and certain reserves of the fuel cycle are pointed out. (5 refs.)

99615 Reactor tests of two thermoemission electric power generating elements in a single loop channel. V.P.Baril'chenko, V.P.Berzhatyi, A.S.Karnaukhov, V.P.Kirienko, V.A.Maevskii, V.K.Morozov, A.V.Nikonov, N.N.Parkhomenko, V.S.Pastukhov, V.V.Sinyavskii, Yu.A.Sobolev.
Sov. At. Energy (USA), vol.53, no.6, p.866-8 (Dec. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.6, p.402-4 (Dec. 1982).
An important stage for the technical achievement of thermoemissive energy conversion is the complex reactor investigations of the thermoemission electric power generating elements (EPGE) and multielement assemblies. One of the problems of these tests is the verification of the reproducibility and stability of the power generating characteristics of EPGE of the same kind. Comparison of the results of EPGE tests or tests of EPGE assemblies, conducted nonsimultaneously, is not always correct, in view of the different test conditions. It is difficult to ensure identical working parameters in different tests, e.g., heat release, temperature of individual components of the channel, pressure of the working substance, etc. Therefore, in order to eliminate this indeterminacy it is desirable to test the individual EPGE or their assemblies simultaneously and in one loop channel. For this purpose, a loop channel was developed and tested, with two independent identical EPGE. (4 refs.)

28.42 FISSION REACTOR MATERIALS

99616 **Characterization and storage of high-level waste.** C.Bauer, G.Ondracek (Univ. Karlsruhe, Karlsruhe, Germany).
Atomwirtsch.-Atomtech. (Germany), vol.28, no.7-8, p.393-9 (July-Aug. 1983). In German.
Presents a summary review dealing with the characterization and storage of high-level radioactive waste, the design and structure of waste packages (product and enclosure), and the technology of waste packages (also storage forms) and their interrelations. The discussion of the possibilities for long-term isolation of high level waste from the biosphere indicates continental geological formations as suitable repository sites. For the Federal Republic of Germany, these are rock salt formations whose states and the modification resulting from the storage of high-level waste determine the minimum criteria to be met by the designs of storage forms fit for ultimate repository storage. (58 refs.)

99617 **Analysis of the hexcan of a fast breeder reactor with a through crack.** F.Cesari (Dipartimento Reattori Veloci, ENEA, Bologna, Italy).
Comput. & Struct. (GB), vol.17, no.5-6, p.643-7 (1983). (Proceedings of the 4th ADINA Conference, Cambridge, MA, USA, 15-17 June 1983).
Application of the finite element method to the problem involving a superficial crack in a hexcan of a fast breeder reactor is discussed. The aim is to calculate the stress intensity factor of the hexcan with a through crack in the static and dynamic case, loaded with the internal pressure. In the dynamic fracture the crack is considered both fixed and propagating. The structure is discretized with shell elements of 6 and 8 nodes available in the ADINA code. (8 refs.)

99618 **Experiences in nonlinear shell analysis using ADINA.** P.Hypponen, H.Raiko (Nuclear Engng. Lab., Tech. Res. Centre of Finland, Helsinki, Finland).
Comput. & Struct. (GB), vol.17, no.5-6, p.649-52 (1983). (Proceedings of the 4th ADINA Conference, Cambridge, MA, USA, 15-17 June 1983).
The calculation of a steel pipe collapse loading test using ADINA is presented. In the test a simply supported pipe was loaded in the middle by a 50 mm broad loading head and the force-displacement ratio was measured. The test pipe was modelled by using thin shell elements and the contact problem on loading surface was described by stiffening truss elements. The load itself was given as a prescribed displacement to the truss elements. The calculation was static, geometrically and materially nonlinear including instability and contact problem. The calculations were made on both CDC CYBER 173 and CRAY 1 computers whose running times were compared too. (2 refs.)

99619 **Near-field thermomechanical response of a waste vault.** R.S.C.Wai, K.K.Tsui (Dept. of Geotech. Engng., Ontario Hydro, Toronto, Ontario, Canada).
Comput. & Struct. (GB), vol.17, no.5-6, p.677-87 (1983). (Proceedings of the 4th ADINA Conference, Cambridge, MA, USA, 15-17 June 1983).
The near-field thermomechanical response of an immobilised waste disposal vault in crystalline hard rock was studied numerically taking into account the nonlinear behaviour of the host rock. The results indicate that the temperature dependence of rock properties has relatively little effect on the transient temperature distributions but may increase the thermal stresses and displacements substantially. However no deep-seated, major overstressed zones are expected. (17 refs.)

99620 **Thermomechanical calculations related to thermally induced rock loosening in an underground cavity.** L.Liedtke, J.Kopietz (Federal Inst. for Geosci. & Natural Resources, Hannover, Germany).
Comput. & Struct. (GB), vol.17, no.5-6, p.891-902 (1983). (Proceedings of the 4th ADINA Conference, Cambridge, MA, USA, 15-17 June 1983).
Zones of loosening, together with failure probability and safety factors, can be used to characterize the stability of underground caverns. The effect of a cylindrical heat source on the surrounding rock salt has been investigated in an in situ test carried out in a rock salt mass at a depth of about 750 m. The results of the calculations were confirmed by comparison with the temperatures and displacements measured during the in situ experiment. This research has implications for radioactive waste disposal. (10 refs.)

99621 **Chemical thermodynamics of iodine species in the HTGR fuel particle.** T.B.Lindemer (Chem. Technol. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
CALPHAD: Comput. Coupling Phase Diagrams & Thermochem. (GB), vol.7, no.2, p.87-102 (April-June 1983).
The iodine-containing species in an intact fuel particle in the high-temperature gas-cooled reactor (HTGR) have been calculated. Assumptions include: (i) attainment of chemical thermodynamic equilibrium among all species in the open porosity of the particle, primarily in the buffer layer; and (ii) fission-product concentrations in proportion to their yields. The primary gaseous species is calculated to be cesium iodide; in carbide-containing fuels, gaseous barium iodide may exhibit equivalent pressures. The condensed iodine-containing phase is usually cesium iodide, but in carbide-containing fuels, barium iodide may be stable instead. Adsorption of elemental iodine on the carbon in the particle appears to be $\leq 10^{-4}$ μg I/g C. The fission-product-spectra excess of cesium over iodine would generally be adsorbed on the carbon, but may form Cs_2MoO_4 under some circumstances. Equilibria exterior to the fuel particle have not been analyzed, and may be considerably different from those given above. (19 refs.)

99622 **International measures of nuclear materials control.** M.Canty, E.Munch, G.Stein (Kernforschungsanlage Julich, Germany).
Energiewirtsch. Tagesfragen (Germany), vol.33, no.6, p.361-8 (June 1983). In German.
With the increasing use of nuclear energy worldwide, fears that the availability of nuclear weapons materials will inevitably follow seem not without foundation. The authors review the international efforts to limit the proliferation of nuclear materials, considering the technical aspects of their effective control and monitoring. (8 refs.) *S.R.*

99623 **Subjective evaluation using expert judgment: an application.** F.P.Sioshansi (Decision Analysis Group, Woodward-Clyde Consultants, San Francisco, CA, USA).
IEEE Trans. Syst., Man & Cybern. (USA), vol.SMC-13, no.3, p.391-7 (May-June 1983).
Objective evaluations based on analytical techniques are of limited value in the absence of specific information about some of the key parameters. A quantitative evaluation procedure is developed based on the subjective judgement of a group of experts. The methodology is used to identify plug designs with a high likelihood of satisfactory performance for a nuclear waste repository. (26 refs.)

99624 **Sodium, a domesticated metal.** G.Lucenet (Electricite de France, Paris, France).
Rev. Fr. Electr. (France), vol.55, no.279, p.8-10 (Dec. 1982). In French.
Figures are given for the growth in annual production of sodium, and the development of electrochemical methods since 1807 is reviewed, with a description of a modern electrolytic cell. Industrial applications of sodium are listed by way of introduction to the main theme which is the use of molten sodium as a heat-transfer fluid in fast nuclear reactors. The behaviour of sodium fires (without flame) is described, with notes on fire-extinguishing agents and safety measures in fast-neutron reactor design. The sodium-water reaction is discussed. The author concludes that, where due precautions are taken, sodium is neither more nor less dangerous than other liquid or solid metals in use, even in the LMFBR. (no refs.) *M.B.D.*

99625 **Radiological bases of the long term management of radioactive wastes.** H.Jammet, M.Dousset.
Tech. Mod. (France), vol.75, no.3-4, p.14-20 (March-April 1983). In French.
Ecologists are particularly concerned about the environment. This includes the effects of industrial residues and, in particular, wastes from the nuclear industries. The paper gives some information as to what constitutes radioactive wastes, risks arising from them, the methods of protecting human beings and the necessary conditions for their long term management. Radioactive wastes are first classified, being largely split into long and short periods of decay. Sections then follow on risks and principles of protection and the limitation of individual doses. The last section covers the actual methods of stocking these wastes and methods of protecting mankind in general. Various criteria which govern these matters are given. (no refs.) *G.V.D.*

99626 **Atomic displacement rates of light ions in cubic metals.** P.Jung.
Report JUL-1823, Kernforschungsanlage, Julich, Germany (Jan. 1983), 51 pp.
Atomic displacement rates of light ions in cubic metals (Al, V, Fe, Cu, Nb, Mo, Ag, Pt and Au) are calculated. The parameters used are chosen such that the calculations fit all available data of electron, ion and fast neutron irradiations as closely as possible. This procedure allows a more reliable extension of the calculations to energies beyond the range of existing data. Interpolation of the parameters of different materials enables the calculation of displacement rates for metals where no light ion data are available, (Ni, Pd, Ta, W and stainless steel). Further on helium-to-dpa ratios are calculated for those metals, which are of interest for fusion reactor applications. (67 refs.)

99627 **Guide to the Canadian nuclear fuel waste management program. Second edition.**
Report AECL-7790, Atomic Energy Canada Ltd., Chalk River, Ont. (Feb. 1983), 60 pp.
This document describes the administrative structure and major research and development components of the Canadian Nuclear Fuel Waste Management Program. It outlines the participating organizations, summarizes the program statistics, and describes the international cooperation and external review aspects of the Program. It is the second edition of the Guide, which was first issued under the same title in December 1981. (101 refs.)

99628 **Neutron radiography in Grenoble. I. A complementary means for inspecting nuclear fuels during irradiation.** F.Michel (CENG-CEA, Grenoble, France).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.241-9
Among the many facilities developed in Grenoble to carry out a great variety of experimental irradiations, neutron radiography affords an important specific contribution: inspection of the assembly of the irradiation rigs, evolution of the physical state of the fuel pins, dimensional measurements. The technique is contrived to interrupt the irradiation process for as short a time as possible. Its results constitute a valuable complement to those of other in-pile methods of analysis, to furnish data permitting a high level interpretation of the on-going irradiation experiment. (7 refs.)

99629 **TREAT neutron radiography facility.** L.J.Harrison (Argonne Nat. Lab., Idaho Falls, ID, USA).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.251-5
The TREAT reactor was built as a transient irradiation test reactor. By taking advantage of built-in system features, it was possible to add a neutron radiography facility. This facility has been used over the years to radiograph a wide variety and large number of preirradiated fuel pins in many different configurations. Eight different specimen handling casks weighing up to 54.4 t (60 T) can be accommodated. Thermal, epithermal and track-etch radiographs have been taken. Neutron radiography service can be provided for specimens from other reactor facilities, and the capacity for storing preirradiated specimens also exists. (3 refs.)

99630 **Hot Fuel Examination Facility neutron radiography reactor design.** W.J.Richards, G.C.McClellan (Argonne Nat. Lab., Idaho Falls, ID, USA).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.257-62
The high demand for neutron radiography of both irradiated and non-irradiated reactor structural and fuel specimens resulted in the decision to install a neutron radiography facility in the Hot Fuel Examination Facility/North at Argonne National Laboratory's Idaho Site. The neutron radiography facility was designed for both in-cell and out-of-cell radiography with high throughput. The facility uses state-of-the-art radiography techniques with maximum flexibility for incorporating radiography techniques to be developed in the future. (4 refs.)

99631 **Operation and modification of the HEDL Neutron Radiography Facility (NRF).** R.L.Tomlinson, J.F.Perfect (Westinghouse Hanford Co., Richland, WA, USA).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.263-70
The Neutron Radiography Facility (NRF) at the Hanford Engineering Development Laboratory (HEDL) was originally built to perform neutron radiography of unirradiated fuel pins for the fast flux test facility (FFTF). Modifications have been completed recently on the NRF which now enable neutron radiography of irradiated fuel pins to be accomplished. In addition, modifications were made to the existing facility to improve handling capabilities and enable precise alignment of unirradiated fuel assemblies which contain 217 fuel pins. The equipment design had to provide for safe handling of the irradiated components to prevent excessive radiation exposure to personnel. Procedures were developed and interlocks installed to supplement the design and provide an additional margin of safety for the facility components and cask handling equipment. While the facility was shut down for modifications, certain other changes were made to the existing facility to improve the beam intensity and quality. (2 refs.)

99632 Design of the Fuels and Materials Examination Facility (FMEF) neutron radiography facility for irradiated fuel. R.L.Tomlinson, J.B.Henshall (Westinghouse Hanford Co., Richland, WA, USA).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.271-7
The Fuels and Materials Examination Facility (FMEF) is a breeder reactor program facility currently under construction at the Hanford Reservation. Major activities carried out in the FMEF are post-irradiation examination of breeder reactor subassemblies, fuel and control pins, and materials; test pin fabrication for use in the Fast Flux Test Facility (FFTF); and Secure Automated Fabrication (SAF) of FFTF and Clinch River Breeder Reactor fuel. An important feature of the FMEF is the neutron radiography examination facility which will examine full or partial fuel assemblies at short decay times following long-term reactor irradiation. The neutron source is a one-megawatt TRIGA reactor which supplies intense neutron beams to the two neutron radiography exposure facilities. These two exposure facilities operate simultaneously and independently so that both full fuel assemblies and individual fuel pins can be neutron radiographed in the separate exposure facilities at the same time using collimation systems that are continuously and remotely variable over a wide range of resolutions. (3 refs.)

99633 Examination of fuel rods by means of neutron radiography. U.Bergenlid, I.Gustafsson (Studsvik Energiteknik AB, Nykoping, Sweden).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.349-53
Examinations by means of neutron radiography have been performed at the Studsvik R2 and R2-0 reactors for a number of years. The work is mainly related to investigations of the behaviour of nuclear fuel rods. The radiography facility at the R2 reactor is described. This is followed by examples of radiographs of fuel rods illustrating various kinds of information which can be obtained. Measurements of fuel pellet dimensions require a high precision. A microdensitometric method has been used for this purpose and is described. (1 ref.)

99634 Neutron and gamma radiography of UO_2 and TRIGA fuel elements. A.H.Robinson, Y.C.Gao, A.G.Johnson, J.C.Ringle (Oregon State Univ., Corvallis, OR, USA).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.355-63
The Oregon State TRIGA reactor neutron radiography facility has been used to produce both neutron and gamma radiographs of reactor fuel. In this paper a comparison of the applicability of neutron and gamma radiography to both UO_2 fuel pins and TRIGA fuel elements is made. (no refs.)

99635 Inspection of Pu particle in UO_2-PuO_2 pellet by neutron radiography. A.Tsuruno (JAERI, Tokai, Japan).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.365-8
For the quality control of UO_2-PuO_2 pellet the inspection of Pu particle has been done by neutron radiography at JRR-4 NRG facility. Four Pu particles have been found out successfully. For the image analysis the enhancement of the contrast has been carried out by the filter tailoring beam method, and the result of calculation and experiment are presented. (2 refs.)

99636 The application of neutron radiography for the testing and investigation of nuclear fuel elements. V.T.Korneev, K.P.Dubrovin, E.G.Ivanov (I.V. Kurchatov Inst. of Atomic Energy, Moscow, USSR).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.375-82
The experience of using the neutron radiography method for the nondestructive testing and investigation of fuel elements of nuclear reactors is reported. The neutron radiography facility constructed on the basis of the vertical channel of the MR-type reactor is described. Practical results of using the neutron radiography for analysis of irradiated and nonirradiated fuel elements are presented. (7 refs.)

99637 Neutron radiography applications. H.P.Leeflang, H.Kwast (Netherlands Energy Res. Found., Petten, Netherlands).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.383-9
Neutron radiography is proposed to be applied as a non-destructive inspection method for the examination of irradiated fuel as well as for other material irradiation experiments. In the irradiation programme being carried out in the High Flux Reactor (HFR) several fuel irradiations are foreseen. These irradiations are meant to investigate the behaviour of fuel and cladding under a variety of conditions. (6 refs.)

99638 Application of epithermal neutron radiography to performance tests on advanced LMFBR fuel. J.Bordo, F.Mason, P.Zeisser (Joint Res. Centre, Comm. of the European Communities, Petten Establ., Petten, Netherlands).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.391-4
Neutron radiography is a current means for non-destructive examination of nuclear fuel, in particular on irradiated, highly radioactive specimens, to detect fuel cracking, fuel location, central void formation, gas closure and related phenomena. LMFBR fuel holds a large fraction of fissile nuclei by virtue of which it becomes less transparent to thermal neutrons. The application of epithermal neutrons, however, yields satisfactory penetration. This paper presents some results of the epithermal neutron radiography examination of a high enriched 8 mm mixed carbide fuel pin after different stages of in-pile operation. The paper highlights in particular the early occurrence of cracks and the gradual process of healing. (3 refs.)

99639 Neutron radiography of subassemblies or pins in a hot laboratory. P.Boyer, E.Le Boulbin, P.Millet.
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.395-401
Neutron radiography is a nondestructive process used for examination of spent fast breeder reactor fuel. Two facilities are available: the Fuel Subassembly Dismantling Laboratory (LDAC) for the RAPSODIE reactor, and the Spent Element Cell (CEI) for the PHENIX plant. Both comprise a reactor designed to provide neutron radiographs of spent fuel pins or subassemblies by the image transfer method. This paper describes the reactors, reviews their operational history and presents some significant results obtained. (no refs.)

99640 Feasibility of EPI-thermal neutron radiography of fast reactor fuel assemblies. C.T.Oien (Sandia Nat. Labs., Livermore, CA, USA), J.P.Barton, C.F.Barton.
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.403-10
Penetration of the quantities of enriched fuel contained in typical fast reactor fuel bundles cannot be achieved using standard thermal neutron radiography techniques. This study was therefore undertaken to demonstrate the potential of epithermal neutron techniques. A combination of calculations and experiments using simulated fuel showed that: (1) intensities of epithermal neutrons from a 1 MW Triga reactor are sufficient to penetrate a 217-pin bundle of typical LMFBR fuel and provide sensitivity to pellet-size discontinuities; (2) neutrons from fissions generated in the fuel should not cause prohibitive background 'noise'; (3) for basically symmetrical bundles, the ability to detect discontinuities depends greatly on the precise angles at which the bundle is radiographed; (4) multi-angle radiography combined with computerized axial tomography can provide powerful analysis of selected cross sections. (7 refs.)

99641 Ex-core neutron radiography of large fuel bundles. E.A.Rhodes (Reactor Analysis & Safety Div., Argonne Nat. Lab., Argonne, IL, USA), J.P.Barton, C.F.Barton, G.A.Schlapper, R.M.Brugger, A.DeVolpi, C.E.Dickerman, D.Rose.
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.411-18
At the Transient Reactor Test (TREAT) Facility, reactor transients induce destructive fuel motion in test capsules to study the effects of simulated LMFBR hypothetical core disruptive accidents. In TREAT Upgrade (TU), capsule size will increase to 37 or more fuel pins with steel casings up to 7.2 cm thick. Neutron radiography is used in determining final material disposition and sectioning planes for post-mortems. For TU, objectives are to provide mass and 3D spatial resolution of displaced fuel and to identify steel and sodium. A number of penetrating radiographic techniques were investigated for large fuel bundles, including the use of cold, epithermal, 24-keV, and 14-MeV neutrons. It is found that through a combination of techniques, TU radiography needs can likely be met, if sources of sufficient intensity and detection methods of adequate sensitivity are made available. (7 refs.)

99642 Recent developments and capabilities in neutron radiography at HEDL. J.E.Tobin, R.A.Karnesky (Westinghouse Hanford Co., Richland, WA, USA).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.419-23
Radiographic imaging of irradiated fuels has routinely been qualitative in nature, providing information on the general condition of internal components of a fuel pin. Conventional X-ray and neutron radiographic techniques, applicable to irradiated fuels, have not been of high enough resolution to be useful for quantitative image analysis. Recently, however, high resolution neutron radiographic techniques and image analysis, using precision microdensitometry, have been developed at HEDL. The versatility of these radiographic techniques and associated image analysis is such that precision measurements of highly radioactive components can be performed with minimal modification. The use of high resolution neutron radiography and associated image analysis techniques can significantly reduce the cost of fuel pin performance evaluation by decreasing the number of destructive examinations required. This paper describes the development of a high resolution neutron radiographic imaging method, and the modification of a previously developed system to obtain quantitative measurements from neutron radiographs. (6 refs.)

99643 Postirradiation examination using neutron tomography. D.M.Tow (EG&G Idaho Inc., Idaho Falls, ID, USA).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.425-35
Reconstructive tomography using multiple neutron radiographs, or neutron tomography, is being developed at the Idaho National Engineering Laboratory (INEL) for the examination of nuclear fuel bundles which have been irradiated in test situations. A study has been in progress for about a year to define suitable data collection and processing requirements and to estimate achievable image quality. An iterative maximum entropy reconstruction algorithm, MENT, was judged appropriate for this application and used to generate all reconstructions for the study. Cross-sectional images of a 91-pin fast breeder reactor fuel bundle were obtained from 36 penetrating neutron radiographs of the bundle. The fuel pins and most of the spacer wires can be distinguished in these reconstructed images. Computer simulations were also conducted. Results show that reconstructions of nearly symmetrical arrays of fuel elements can be misleading. A reconstruction which appears robust and plausible may inaccurately show only the symmetrical features. Important irregularities such as mispositioned spacer wires may not appear if an insufficient number of radiographic views is used. (2 refs.)

99644 Neutron radiography applications and techniques at the Hot Fuel Examination Facility. G.C.McClellan, W.J.Richards (Argonne Nat. Lab., Idaho Falls, ID, USA).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.437-43
Neutron radiography has been used extensively to the Hot Fuel Examination Facility (HFEF) to evaluate the performance of irradiated nuclear fuels and materials. This nondestructive technique has proved extremely valuable in determining the internal condition of fuel pins during various stages of their burnup lifetime. Such features as pellet separation, voids, bond-sodium level, fuel cracking, and fissile density variations are easily detected by means of neutron radiography. Neutron radiography is also performed on large specialized assemblies. These include complete fuel-bundle assemblies, safety-test loops, and test sections from very large-scale safety-test loops following severe in-reactor tests. The HFEF neutron radiography facility is being expanded to provide more versatility and to allow further development of advanced neutron radiography techniques. (8 refs.)

99645 In pool neutron radiography of a BWR control blade. W.J.Oosterkamp, F.J.v.d. Kaa (KEMA, Arnhem, Netherlands).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.447-52
The control blades of boiling water nuclear power reactors (BWR) are an important part of their safety system. The blades are formed on an array of stainless steel tubes filled with boron carbide as a neutron absorber. In 1978 it became obvious that these blades could lose effectiveness before the end of their mechanical design life. Stress corrosion cracking will occur at a certain exposure and tritium and boron carbide can be lost to the coolant. The latter will reduce effectivity of the control blades. A nondestructive method to detect significant borium losses would be of help to assess the quality of the blades. The standard method is to measure the reactivity effect of a high exposure blade as compared to a low exposure blade. This is time consuming and effects the critical path of the refueling operation. The method gives furthermore no details. Neutron radiography has been used by Spalthoff et al. on a similar blade from the power station at Gundremmingen with a Sb-Be source. The authors had a small 0.5×10^8 n/s source available from an experimental reactor. Its strength was a factor 1000 lower than commonly used. (2 refs.)

99646 Inspection of reactor fuel- and absorber-elements by means of neutron radiography with a small size antimony-beryllium neutron source. L.Greim, W.Spalthoff (GKSS-Res. Center Geesthacht, Geesthacht, Germany).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.453-9
For applications of neutron radiography in hot cells a small size antimony-beryllium neutron source has been designed and constructed. It has cylindrical shape with a diameter and a length of about 20 cm. The measured thermal neutron flux is 1.1×10^{-8} n/cm^2 s per kCi ^{124}Sb. The results of an inspection of a spent BWR absorber element are shown. The neutron radiographs done with the dysprosium transfer method revealed defects in the absorber tubes and loss of absorber material. The track etch foil imaging technique was used at the examination of a fuel element dummy of the ship NS Otto Hahn as test for a method for the detection of defective fuel pins. (8 refs.)

99647 Neutron radiography feasibility studies for steel examination for the liquid metal fast breeder reactor program. K.G.Golliher (US DOE, Albuquerque, NM, USA).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.461-8
Neutron radiographs of specimens, representing Liquid Metal Fast Breeder Reactor components, were made at the Shield Test and Irradiation Reactor. The specimens were radiographed through the neutron-perturbing environments of sodium, piping insulation material, and additional steel in an attempt to mock up the LMFBR primary containment vessel and the main coolant header. Calculations and measurements of the neutron energy distribution used for the tests were made and compared to that in a Liquid Metal Fast Breeder Reactor. The radiographs produced are an evaluation of the feasibility of using neutron radiography to perform, in situ, vessel and piping examination. (3 refs.)

99648 Creep strain measurements on irradiated stainless steel samples by means of neutron radiography. H.Hausen, R.Lolgen (Joint Res. Centre, Petten Establ., Petten, Netherlands).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.469-80
Precise measurements of creep strains are essential for the successful operation of in-pile creep experiments. In the present case a large nunber of steel alloy samples are irradiated in a special reactor creep facility under the influence of uniaxial tensile load and temperature. Creep strain measurements are to be performed intermittently during reactor shutdown periods. To facilitate the periodic dimensional checks, measurement by means of a neutron radiograph image was introduced as an alternative to the conventional techniques requiring difficult unload-reload procedures of the irradiated samples and transport to hot cell facilities. The paper details the special design features of the in-pile steel creep rig and explains the layout principles of a dummy sample column which was measured by a 'marker' technique, whereby the change in specimen gauge length is followed by measuring shoulders which are marked by thin segments of dysprosium. (no refs.)

99649 Reactor in-situ test-fuel neutron radiography. A.DeVolpi, E.A.Rhodes (Reactor Analysis & Safety Div., Argonne Nat. Lab., Argonne, IL, USA).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.481-6
The hodoscope at TREAT has been adapted to provide time-integrated radiographic images of fuel distribution. The reactor operating at a low steady-state power induces fission neutrons in the test fuel monitored by the hodoscope. The fast neutrons are detected in two arrays of recoil-proton detectors. A fast-neutron radiograph can be reconstructed from the digital data. Four key benefits are: the radiographs have good sample density contrast, the data may be obtained soon after a preceding destructive experiment, it is not necessary to disturb the test sample, and the digital data format is directly compatible with quantitative analysis. (no refs.)

99650 Image restoration to increase resolution of the fast-neutron hodoscope. E.A.Rhodes, A.DeVolpi (Reactor Analysis & Safety Div., Argonne Nat. Lab., Argonne, IL, USA).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.487-94
The fast-neutron hodoscope is a cineradiographic device that monitors fuel motion within thick opaque test capsules during power transients at the Transient Reactor Test Facility reactor which simulate LMFBR accident conditions. By means of a collimator and a detector array, emissive neutron radiographic digital data are collected in time-resolved and time-integrated (scan) modes. The data are digitally reconstructed into radiographic images and used directly for quantitative analysis. Spatial resolution is adequate in most cases (due in part to fuel-motion correlation), but is marginal for a few experiments. To enhance the resolution of existing collimators, hardware and software techniques are being applied, including collimator repositioning, decreasing scan increments, noise reduction, and fitting procedures involving fuel-motion models and deconvolution. Significant improvements in spatial resolution have been obtained. (8 refs.)

99651 Neutron resonance transmission analysis of reactor spent fuel assemblies. C.D.Bowman, R.A.Schrack, J.W.Behrens, R.G.Johnson (NBS, Washington, DC, USA).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.503-11
A method called neutron resonance transmission analysis (NRTA) is under study which would use a pulsed neutron beam for nondestructive isotopic assay of a complete spent fuel assembly. Neutrons removed from the collimated beam by absorption or scattering in the resonances of the various isotopes in the spent fuel appear as dips in the neutron transmission. The method is completely insensitive to matrix materials such as oxide, fuel cladding, and other structural members. Measurements on spent fuel buttons using the NBS linac as a pulsed neutron source demonstrate a high accuracy capability for the isotopes ^{234,235,236,238}U, ^{239,240,241,242}Pu, ^{241}Am, ^{243}Am, and several fission products. The NRTA method offers high speed and modest operational cost, and it can be implemented with commercially available medical or radiographic γ-ray generators adapted for neutron production. (3 refs.)

99652 Resonance neutron radiography. Y.T.Cheng, D.A.Garrett (NBS, Washington, DC, USA).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.513-17
A resonance neutron tomography project was carried out at the National Bureau of Standards which included (1) the construction of the reactor-based resonance neutron safeguards experimental system and the making of provisions for its use, and (2) the initial tomographic construction of a nuclear waste container. (no refs.)

99653 Use of cellulose nitrate for neutron radiographic testing of burned fuel elements. R.Barbalat (Services des Piles de Saclay, CENS, Gif-sur-Yvette, France).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.747-53
Nitrocellulose film, which is insensitive to gamma rays and visible light, is ideal for neutron radiography, especially for the inspection of radioactive materials. The low contrast, allows maximum information recording in a single irradiation, by multi-stage development of the latent picture, securing successively all the details from the lowest to the highest absorption cross section. Similarly, interesting results can be obtained by selecting the right fluence for the test material. Unlike silver halide film, prolonged irradiation and/or development time does not affect the picture substantially. The fineness obtained is equivalent to that procured by the slowest radiographic films. The low contrast is compensated by copying the film at every stage of the development on high contrast silver film. Owing to the good transparency, direct examinations and optical measurements are possible by means of optical instruments or perhaps of polarization filters, directly on the negative nitrocellulose film. (no refs.)

99654 Track-etch radiography using ^{10}B$_4$C convertor. G.Matsumoto, N.Murata, M.Matsumoto, S.Suzuki (Nagoya Univ., Nagoya, Japan).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.767-74
To take a neutron radiographic image of irradiated reactor fuel with portable neutron source, the authors should improve the efficiency of (n,α) convertors. In the case of natural BN convertors, image intensifying techniques should be applied. When the enriched B$_4$C convertor was used, printing nega track-etch film to printing papers by a commercial machine became possible. (no refs.)

99655 Development of an enriched elemental boron-10 conversion screen for improved 'track-etch' image recording. K.D.Meares (Eagle-Picher Industries, Miami, OK, USA).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.775-83
A free standing reusable boron-10 screen has been developed for routine use in the NR of irradiated fuel elements using the 'track-etch' technique. The finished part consists of a boron-10 coating on a substrate (usually aluminum) to produce a screen with the desired geometry and properties. Coatings from 1 to 40 mils have been produced and large substrates can be coated to meet production NR requirements. Various alternate concepts were explored with the ultimate selection of a coating technique which performs in NR nearly like a monolithic B-10 sheet. Performance was found to greatly depend on the particle-size distribution of the powder which was eventually tailored to produce optimum packing and minimize pore size in the coating. Surface finishing techniques were examined and tested. (9 refs.)

99656 Development of enriched boron track-etch convertor screens for neutron radiographic applications. R.L.Tomlinson, J.E.Tobin (Westinghouse Hanford Co., Richland, WA, USA).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.785-92
The Neutron Radiography Facility (NRF) located at the US Department of Energy (DOE) Hanford site near Richland, Washington was used to evaluate a series of natural and enriched boron compounds for potential use as track-etch neutron radiographic convertor screens. Materials were evaluated for various parameters; e.g. resolution, uniformity, exposure time, radiation damage (gamma radiation) and physical durability. The boron screens are to be used with commercially-available cellulose nitrate sheets to produce high-resolution track-etch neutron radiographs of irradiated fast reactor fuel. Since the gamma-ray exposure from the irradiated fuel is high during neutron radiography, radiation damage tests were performed on the screens using the cobalt-60 irradiation facility operated by the Hanford Engineering Development Laboratory (HEDL) to evaluate the screen durability. Interest centered upon the highly-enriched boron compounds so that the required exposure time for the neutron radiographs could be minimized. (7 refs.)

99657 On the underlying causes for the shape of the density trace of a round object. R.Matfield (Joint Res. Center, Ispra, Italy).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.817-23
The inherent unsharpness of a density trace produced by a converter foil and a film are considered to be represented by a pure scatterer introduced into the radiation beam. Furthermore, at the background/image interface some of the scattered radiation will be lost from the background region on the film and will instead arrive at the edge of the image. The combination of the geometric and inherent effects produce the rounding of the corners of a density trace of a square object, the effects on a cylindrical object are also considered. Applying these arguments to the geometry of a fuel pellet within a cladding tube it is concluded that the peaks on a density trace which represent the position of the edge of the pellet and the inside of the cladding tube will not be significantly changed in the horizontal dimension by the effects of unsharpness, but the vertical positions will vary with different film and foil combinations. (3 refs.)

99658 Neutron radiography in Grenoble. II. Its application in routine dimensional measurements on irradiated experimental fuel pins. A.Jegat (CENG-CEA, Grenoble, France).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.825-32
For pt.I see F. Michel, ibid., p.241-249. The author describes the equipment and method used by the Grenoble Reactor Department to perform systematic dimensional measurements on neutron radiographs carried out at different stages in the evolution of an experimental fuel during irradiation. The precision of these measurements on the profiles and diameter of the fuel and cladding is better than ±50 μm. Examples of results and the correlations obtained through partial automation of the method are presented. (3 refs.)

99659 Application of neutron radiography in light water reactor fuel pin testing programs at the high flux reactor Petten. J.Bordo, J.Bakker, J.F.W.Markgraf (Joint Res. Centre, Commission of the European Communities, Petten Establ., Petten, Netherlands), I.Ruyter, R.Schumann.
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.833-42
Neutron radiography is a major non-destructive test method used for investigations of LWR fuel rods at HFR Petten. More than 150 fuel rods have been neutron radiographed at various stages of irradiation testing. A review of equipment methods and results is presented. Interpretation of neutron radiographs as to dimensional changes, fuel stack condition, fuel rod condition and condition of instrumented fuel rods and irradiation devices is discussed. Based upon selected examples, the importance of neutron radiography is demonstrated. (9 refs.)

99660 On the problems relating to the accuracy of the measurement of fuel pin diameters by neutron radiography. R.Matfield (Joint Res. Center, Ispra, Italy).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.843-9

The author identifies the sources of error in the neutron radiographic system and attempts to estimate some of these errors. The sources of error are in the fuel pin materials, the radiographic set-up, the radiographic equipment, image formation, the microdensitometer, the edge criteria and the dimensional measurement from the microdensitometer trace. However, the critical problem area is that of determining a representative edge criteria and upon this will depend the ability of the method to achieve the required measurement accuracy. (6 refs.)

99661 Measuring signal-to-noise ratio of typical neutron radiographs. P.Gade-Nielsen, J.Olsen (Riso Nat. Lab., Roskilde, Denmark).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.851-8

To improve dimensional measurements of nuclear fuel rods by neutron radiography, the authors have found it useful to measure the signal-to-noise ratio of the radiographs. The signal and the noise are measured by a digital image processing system. By further evaluation of the method it is hoped to be able to estimate the influence of noise on dimensional measurements. They present a simple signal-transfer model for the neutron radiography process adopted from X-ray radiography. They also present preliminary measurements of the signal-to-noise ratio on different films. (5 refs.)

99662 Dimensional measurements of the Petten calibration pin. I.Ruyter (KFA Julich GmbH, Julich, Germany), H.Leeflang.

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.867-83

One of the tasks chosen by the Euratom Neutron Radiography Working Group is to determine the dimensional measurement accuracy obtainable with the neutron cameras and scanning equipment at their disposal. As a starting point for this task, a simple calibration pin with accurately known axial dimensions was made. This calibration pin, Petten calibration pin (PCP), was radiographed at the facility employing track-etch film, copies of the original film made, each copy separately measured in Petten and then sent to the members of the working group for dimensional evaluations using their respective measuring equipment. The authors describe the procedures used and summarize the results arrived at. (14 refs.)

99663 Search for adequate quality standards for neutron radiography of nuclear fuel. J.C.Domanus (Nuclear Dept., Elsinore Shipbuilding & Engng. Co. Ltd., Helsinger, Denmark).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.1017-24

In 1979 a Euratom Neutron Radiography Working Group was constituted, which initiated standardization work in the field of neutron radiography of nuclear fuel. As standards for the image quality of neutron radiographs and checking the accuracy of dimension measurements from them, beam purity and sensitivity indicators have been developed. Preliminary investigations have shown that the measurement accuracy problem can be solved by the use of calibration fuel pins, simulating the true nuclear fuel pins and containing such calibrated items as fuel-to-clad gaps, pellet-to-pellet gaps, central voids, and dishings. (3 refs.)

99664 Euratom test program for image quality and accuracy of dimensions. J.C.Domanus (Nuclear Dept., Elsinore Shipbuilding & Engng. Co. Ltd., Helsinger, Denmark).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.1025-33

The Neutron Radiography Working Group (NRWG) constituted within Euratom in 1979 has developed a test program for checking the image quality and accuracy of dimensions measured from neutron radiographs of nuclear fuel pins, using calibration fuel pin with beam purity and sensitivity indicators. Silver halide X-ray films are to be exposed with Gd and Dy converters by the direct and transfer neutron radiography methods. Nitrocellulose film coated on both sides with a converter and without coating, but between two converter screens will also be used. The results will be compared and conclusions drawn about the suitability of the test items for the purpose of assessing the neutron beam constituents, the image quality and the accuracy of dimension measurements. (3 refs.)

99665 On the development of a combined beam, sensitivity and measurement quality indicator for the neutron radiography of fuel pins. R.Matfield (Joint Res. Center, Ispra, Italy).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.1035-41

A radiographic quality indicator for nuclear fuel has been designed that combines the features of a beam purity indicator, a sensitivity indicator and a measurement indicator. This combined quality indicator fuel consists of six-10 mm diameter by 4 mm long fuel pellets contained in a zirconium tube; the gaps between the pellet diameters and the zirconium tube are controlled by aluminium shims. (no refs.)

99666 Recommended practice for the neutron radiography of nuclear fuels. R.S.Matfield (Joint Res. Centre, Ispra, Italy).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.1043-6

The author presents part of a Neutron Radiography Handbook being prepared by a neutron radiography working party of the European Community. It commences with a description of the information that should be provided by a user of neutron radiography services and then gives recommendations on the equipment to be used. This is followed by two sections on the techniques to be used for detecting discontinuities and the making of measurements on nuclear fuel. This is then followed by recommended safety practices and then sections on film handling, film processing, viewing of radiographs, references, radiographs, storage and records. Recommendations on training and certification are being prepared. Technical justification of the practices which are recommended are not included. (1 ref.)

99667 The DOE's nuclear waste management and fuel cycle programs. F.E.Coffman (USDOE, Washington, DC, USA).

Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.3-6

The nuclear waste management and fuel cycle programs of the US Department of Energy are discussed including the West Valley demonstration project and the commitment of DOE to remedial actions. (no refs.)

99668 General perspectives in radioactive waste management in Belgium. P.Dejonghe, L.Baetsle, I.Claes, R.DeBatist, R.Heremans, N.Van de Voorde (CEN/SCK, Mol, Belgium).

Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.7-13

The authors consider the general radioactive waste management policy in Belgium and focuses on R&D and D&D activities as well as on operational and institutional organization. The main ongoing R&D and D&D programs are briefly reviewed, covering treatment and conditioning processes, characterization of final products and geological disposal. Most of these programs are carried out under contract with the Commission of the European Community. The creation of a public organization NIRAS/ONDRAF is reported and its major attributions with respect to institutional, managerial and technical aspects are given. (13 refs.)

99669 The European Communities' R & D activities on treatment and handling of radioactive waste. S.Orlowski, R.Simon (Commission of the European Communities, Brussels, Belgium).

Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.14-18

Since 1973 the Commission of the European Communities has been conducting research and development on the management and disposal of radioactive waste. The activities on treatment and handling presently concentrate on the processing and conditioning of hulls, ILLW, TRU waste and certain gaseous wastes. The important aspects of characterization and evaluation of final waste forms is being investigated under two separate parts of the CEC programme. (6 refs.)

99670 German waste management policy: the back-end of the fuel cycle situation in the Federal Republic of Germany. R.P.Randl, K.H.Hubenthal (Bundesministerium fur Forschung und Technol., Federal Min. for Res. & Technol., Germany).

Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.19-21

The development of nuclear energy and the application of radioisotopes in industry and research in the Federal Republic of Germany have been closely linked to the development of the appropriate requirements with regard to conditioning and disposal of radioactive wastes generated. The authors discuss this parallel development, with reference to the political aspects. (no refs.)

99671 National and cooperative program for waste management in France. Y.Sousselier (Inst. de Protection et Surete Nucleaire, CEA, Paris, France).

Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.22-6

The radioactive waste management policy in France is to reprocess the spent fuel and store only the resultant wastes rather than storing the spent fuel itself. The processes used for conditioning the different categories of wastes are presented, and the waste management policy discussed. (no refs.)

99672 Status of high level and alpha bearing waste management in PNC. K.Uematsu (Power Reactor & Nuclear Fuel Dev. Corp., Tokyo, Japan).

Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.27-33

The Power Reactor and Nuclear Fuel Development Corporation (PNC) of Japan has a major role in promoting the management of high level and alpha bearing waste, which is indispensible in completing the fuel cycle. The fuel element reprocessing, vitrification, and geological disposal of these wastes in discussed. (no refs.)

99673 A review of radioactive waste management programmes in the United Kingdom. N.J.Keen (UKAEA, Harwell, England), A.G.Duncan.

Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.34-9

The authors report progress by the Department of the Environment and the nuclear industry in developing and implementing a strategy for the management of radioactive waste in the UK. It outlines the range of possible disposal facilities required to deal with all classes of waste arising from nuclear power generation. The present practices for waste management and the main lines of development by the main waste producers of the plant needed in future are outlined, together with a summary of some of the generic R&D devoted to treatment, packaging and transport of wastes. (3 refs.)

99674 High-level waste immobilization. J.L.Crandall (E.I. du Pont de Nemours & Co., Savannah River Lab., Aiken, SC, USA).

Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.43-9

Analysis of risks, environmental effects, process feasibility, and costs for disposal of immobilized high-level wastes in geologic repositories indicates that the disposal system safety has a low sensitivity to the choice of the waste disposal form. (11 refs.)

99675 The status of French high-level radioactive wastes solidification. C.Sombret (CEA, Paris, France).

Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.50-3

Research and development carried out in France over a long period of time about solidification of high-level radioactive wastes have been mainly directed towards vitrification. Investigations into borosilicates resulted in the choice of glass as a final form for the fission products solutions stored in reprocessing plants. AVM, the Marcoule vitrification plant, has been running since 1978. Further, vitrification plants related to the La Hague reprocessing plant are under design. In Marcoule the radioactive glasses coming from AVM have been stored for decades in an interim storage facility located in the same building. Several storage and disposal routes are being considered for the glass containers from LWR reprocessing that will be issued from La Hague (AVH). (2 refs.)

99676 Treatment and solidification of high active fission product solutions. K.D.Kuhn, W.Bahr (Wiederaufarbeitungsanlage Karlsruhe Betriebsgesellschaft mbH., Eggenstein, Germany).

Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.54-8

On reprocessing spent fuel elements, >97% of the fission products are found in the high active waste (HAW) solution. In order to avoid large amounts of sludge formation arising from phosphates produced by TBP degradation during evaporation and storage of these high level wastes, the suspended and dissolved TBP must be removed immediately from the HAW. It is proposed to separate the TBP by steam-stripping. Then the HAW will be concentrated in an evaporator, the concentration factor depending on the amount of sludge formation and the heat content of the concentrate. These concentrates may be stored for short periods in stainless steel tanks. Acid concentration and waste volume may be further reduced by in-tank denitration and evaporation. (7 refs.)

99677 The selection and application of a processing system for the treatment of high level liquid waste in the UK. D.W.Clelland, A.D.W.Corbet (British Nuclear Fuels Ltd., Warrington, England).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.59-63
The historical background and the present status of technology in high level liquid waste treatment are reviewed and progress following the decision to implement vitrification at Windscale is reported. The choice of glass as a matrix is discussed. The process which has been selected for industrial scale operation and the characteristics of the vitrified waste are described. The design and handling of containers are indicated. Some of the principles relating to the storage of vitrified high level waste are discussed related to the method of storage to be employed in the UK. The rate of high level waste arisings in the UK together with present inventories and future conditioning rates are presented and the impact of vitrification on the future role of tank storage is discussed. (5 refs.)

99678 Development of high-level liquid waste solidification in PNC. H.Okamoto, M.Yamamoto, H.Nagai, N.Ohnishi (Power Reactor & Nuclear Fuel Dev. Corp., Tokyo, Japan).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.64-71
R&D activities on the solidification of HLLW and related technologies are being performed with the aim of designing and constructing the HLLW Solidification Pilot Plant at Tokai which is planned to start operations in 1987. Solidified waste forms and compositions have been studied with the aid of characterizing solidified products and evaluating solidification technologies, and two typical series of borosilicate glass products have been found to be feasible for the solidification of HLLW generated by the Tokai Reprocessing Plant. The HLLW Engineering Test Facility (ETF) with denitration and concentration equipment, two different types of Joule-heated ceramic melters, off-gas treatment equipment and a canister handling system, has been in operation since February 1980 in order to obtain various kinds of enginering data and perspectives. Air-cooling tests are also in progress to characterize natural or forced convection heat transfer in the storage of the HLLW solidified waste. (5 refs.)

99679 Industrial operating experience at the Marcoule vitrification facility. M.M.Chotin, P.Hugony, A.Pieraggi (COGEMA, Marcoule, France).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.72-5
The vitrification facility (AVM) located at Marcoule is designed to vitrify fission product solutions from the Marcoule fuel reprocessing plant and has been in operation on an industrial basis since June 28, 1978. Extensive design precautions and sophisticated technological solutions have resulted in simplified operation. The facility has operated with a good duty factor. Nevertheless, the unit is an industrial prototype facility in which a number of problems have been encountered. The review of operating and problems encountered are discussed. (5 refs.)

99680 Reprocessing, decontamination and decommissioning waste management at Eurochemic; current and planned activities. E.Detilleux, W.Hild, J.van Geel (Eurochemic, Mol, Belgium).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.76-83
Since the shutdown of its reprocessing activities, Eurochemic has undertaken the decontamination of the reprocessing plant and the management of the generated wastes. The decontamination has been satisfactorily completed, allowing access to all the process cells. The waste management programme, still going on, includes intermediate and high-level liquid waste treatment by bituminization and vitrification, respectively. Other activities involved spent solvent destruction, the digestion into acids of alpha-bearing solid wastes, etc. The authors outline the main features of the programme. (7 refs.)

99681 Los Alamos transuranic waste size reduction facility. A.Briesmeister, J.Harper, B.Reich, J.L.Warren (Los Alamos Nat. Lab., Los Alamos, NM, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.87-92
A transuranic (TRU) waste size reduction facility (SRF) was designed and constructed at the Los Alamos National Laboratory during the period of 1977-81. The authors summarize the engineering development, installation, and early test operations of the SRF. The facility incorporates a large stainless steel enclosure fitted with remote handling and cutting equipment to obtain an estimated 4:1 volume reduction of gloveboxes and other bulky metallic wastes. (no refs.)

99682 A pilot scale, alpha disassembly and decontamination facility at the Savannah River Laboratory. J.R.Cadieux, G.W.Becker,Jr., A.L.Coogler, G.W.Richardson (E.I. du Pont de Nemours & Co., Savannah River Lab., Aiken, SC, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.93-7
An alpha contained pilot facility is being built at the Savannah River Laboratory (SRL) for research into the disassembly and decontamination of noncombustible, transuranic (TRU) waste. The design and program objectives for the facility are presented along with the initial test results from laboratory scale decontamination experiments with ^{238}Pu and ^{244}Cm. (2 refs.)

99683 An integrated decontamination system for surface-contaminated TRU waste. R.P.Allen, L.K.Fetrow, M.W.McCoy (Pacific Northwest Lab., Richland, WA, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.98-102
Substantial progress has been made in developing an effective, integrated decontamination system capable of removing plutonium and other transuranic contaminants from the surface of metallic and selected nonmetallic waste. Using this system, a reduction of more than 95% in the volume of TRU waste requiring interim storage and eventual geologic disposal has been achieved for typical plutonium-contaminated glove boxes. The authors describe the separate preparation, sectioning, decontamination and waste treatment process steps and illustrates the integration of these into a functional, effective decontamination system. (5 refs.)

99684 Sectioning techniques for plutonium contaminated glove boxes. L.K.Fetrow, R.P.Allen, M.W.McCoy (Pacific Northwest Lab., Richland, WA, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.103-8
The size reduction of plutonium-contaminated glove boxes can substantially reduce storage and disposal volumes and is essential to prepare material for decontamination by advanced techniques such as vibratory finishing or electropolishing. Several industrial sectioning techniques have been evaluated at Pacific Northwest Laboratory under US Department of Energy sponsorship for the size reduction of plutonium-contaminated glove boxes. The techniques evaluated include plasma arc torch cutting, mechanical sawing and nibbling, abrasive cutting, and hydraulic shearing and punching. These demonstration studies show that plutonium-contaminated glove boxes can be sectioned safely, efficiently, and with minimal secondary waste generation for size reduction or decontamination purposes using an appropriate combination of available industrial metal cutting techniques. (3 refs.)

99685 Vibratory finishing for decontamination—pilot scale operation. M.W.McCoy, R.P.Allen, L.K.Fetrow, R.F.Hazelton (Pacific Northwest Lab., Richland, WA, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.109-14
The authors discuss the development of the vibratory finishing decontamination process from a laboratory demonstration to a pilot scale operation. Vibratory finishing is a standard industrial process used in a variety of manufacturing processes. Substantial progress has been made in adapting this vibratory finishing process to the needs of the nuclear industry, and especially to the management of TRU waste. The discussion includes a description of the vibratory finishing process; scale-up of the process including considerations of vibratory finisher size and configuration, rinsing and drying of the decontaminated material, materials handling, contamination control; and a cost analysis of the operation of a vibratory finishing decontamination system. (4 refs.)

99686 Design requirements for a metal smelting facility. L.C.Williams, J.E.Mack (Metals & Ceramics Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Treatment and Handling of Radioactive Wastes, American Nuclear Society Topical Meeting, Richland, WA, USA, 19-22 April 1982 (Richland, WA, USA: Battelle Press 1983), p.115-18
Functional requirements for the smelting of metal scrap contaminated with low-enriched uranium in a Metal Smelting Facility (MSF) have been determined. The process will be designed to smelt ferrous metal scrap that has accumulated at the Oak Ridge Gaseous Diffusion Plant (ORGDP) into one-ton ingots at a rate of 40 ingots per day (10000 tons/year). Total scrap inventories at the ORGDP are currently estimated at 28000 tons. The diffusion plant scrap is primarily contaminated with 100 to 200 ppm Uranium at an enrichment of 0.5 to 1.5% ^{235}U. The scrap is considered special nuclear material (SNM) and cannot be handled by commercial smelters without specific licensing. Slagging will be performed to removed contaminants from the metal and concentrate them in the slag. Process systems will include scrap handling, size reduction, preheating and charging, melting and slagging, ingot casting and storage, and fume exhaust. The MSF has been proposed for FY 1984 line item funding. (no refs.)

99687 Summary of the handling and disposal of nuclear wastes. E.N.Cramer (Southern California Edison, Rosemead, CA, USA).
Greater Los Angeles Area Energy Symposium, Los Angeles, CA, USA, 28 Oct. 1980 (North Hollywood, CA, USA: Western Periodicals Company 1980), p.97-101
This summary addresses some of the accomplishments from 1955 to 1980, to provide rapid and understandable overview of the process. (11 refs.)

99688 The accelerator breeder, a viable option for the production of nuclear fuels. P.Grand (Dept. of Nuclear Energy, Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3057-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The accelerator breeder offers the only practical means of producing, or breeding, large quantities of fissile fuel from particle materials. The author gives the parameters of a nearly optimised accelerator-breeder system, and discusses the development needs, economics, and institutional problems that this breeding concept faces. (5 refs.)

99689 Non-destructive control of plutonium oxide fuel pins by neutron radiography at the BR1 neutron radiography facility. H.Tourwe (SCK/CEN, Mol, Belgium).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.369-73
The neutron radiography facility at the SCK/CEN BR1 reactor has been used since 1975 for the non-destructive quality control of mixed plutonium oxide fuel pins for thermal and fast reactors. The major purposes of this quality control are the detection of density variations and Pu-heterogeneities in the fuel pellets, the detection of voids and foreign materials and a final inspection of the fuel assembling. In the period June 1975 to June 1981 a total of 400 fuel pins were controlled, involving about 300 exposures. (2 refs.)

28.43 FISSION REACTOR OPERATION

99690 Equipment for cassette removal at nuclear power plants. G.Suba.
Minoseg & Megbizhatosag (Hungary), vol.16, no.6, p.438-41 (1982). In Hungarian.
Hungary, namely Ganz-MAVAG Works, have joined in to build machinery for nuclear power plants. Author describes the production of the equipment of cassette removal built within the framework of CMEA specialization, with special regard to the very strict conditions for securing quality. (no refs.)

99691 The corrosion products in primary and secondary circuits of PWR plants. R.Darras.
Rev. Gen. Nucl. (France), no.2, p.138-51 (March-April 1983). In French.
The characteristics of corrosion products generated in primary and secondary circuits of PWR plants are briefly recalled. The problems involved by the relevant pollution of heat transfer media and metal surfaces are then examined. Finally, the main precautions or remedies to be applied in order to minimize this pollution by corrosion products are discussed. (70 refs.)

99692 Comparison of the technicoeconomic characteristics of nuclear power stations with modern thermal and fast reactors. A.A.Rineiskii.
Sov. At. Energy (USA), vol.53, no.6, p.807-15 (Dec. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.6, p.360-7 (Dec. 1982).
The author discusses the economics of thermal and fast reactors and their power generating units. (11 refs.)

99693 Making objects visible in non-transparent media—a method employed in breeder reactor technology. R.Hans, E.Kranz, H.Weiss (Internat. Atomreaktorbau GmbH, Bergisch Gladbach, Germany).
Siemens Power Eng. (Germany), vol.5, no.3, p.162-5 (May-June 1983).
Water-cooled nuclear reactors are inspected by means of television cameras. This method is unsuitable for non-transparent media such as the liquid sodium used as coolant for fast reactors. An ultrasonic facility, whose design and operation are described, has therefore been developed for inspection purposes. The authors explain how this facility is employed to measure the level and flow rate of liquids and to detect bubbles. (no refs.)

99694 The application of indirect radiography to neutron field studies. C.Simans (Faculty of Nuclear Sci. & Phys. Engng., Tech. Univ. of Prague, Prague, Czechoslovakia).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.971-6
Registration of ficticious axially symmetrical neutron fields in rotating conversion foils was used in neutron field studies by indirect radiography with neutron beams from a reactor or a neutron generator. Large size conversion foils consisting of dysprosium salt precipitate in gelatine on triacetate support were developed for field studies in hydrogeneous media. The use of indirect radiography with uranium conversion foils in the study of the field structure of the U 238 resonance group of neutrons is described. (3 refs.)

99695 Cold neutron spectra of the general atomic TRIGA Mk. E neutron radiography facility. J.D.Rogers (Federal Univ. of Rio de Janeiro, Rio de Janeiro, Brazil).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.977-81
Neutron spectra measurements have been carried out on the GA TRIGA Mk. F neutron radiography beam at various temperatures of the solid methane cold source. Results indicate significant number of neutrons with energy above that of the Bragg cut-off for beryllium. (7 refs.)

28.44 FISSION REACTOR PROTECTION SYSTEMS, SAFETY AND ACCIDENTS

99696 Averting danger and protecting against damage in the design of nuclear power plants. H.-P.Bochmann (Bundesministerium des Innern, Bonn, Germany).
Atomwirtsch.-Atomtech. (Germany), vol.28, no.7-8, p.366-72 (July-Aug. 1983). In German.
Under the Atomic Energy Act of the Federal Republic of Germany it is up to the executive branch to determine the adequate risk to society to be tolerated in the peaceful uses of nuclear energy. In the regulatory practice of the Federal and State Governments, two different hazard areas are defined for protective purposes: the avoidance of risks arising to individuals so as to protect third parties, and the minimisation at the executive's discretion, of the risk to the public, beyond the individual risks of life and health, on the basis of balanced expenditures and benefits. Accident guidelines based on deterministic concepts are supplemented, to this end, by probabilistic reliability and risk analyses. (no refs.)

99697 Reactor accidents: a global reassessment of consequences. T.Moore.
EPRI J. (USA), vol.8, no.6, p.16-23 (July-Aug. 1983).
Three Mile Island has prompted a tough reappraisal of fission product release that will lead to a clearer perception of the public risk from nuclear power. The paper discusses the accident source term, giving its definition and shows how previous estimates about its magnitude are grossly exaggerated due to lack of technical and experimental data. Current research into this field world-wide is pointed to and the implications of this on future improved safety are hinted at. (4 refs.)

99698 LWR safety research at EPRI: an update. W.B.Loewenstein, S.P.Kalra (Nuclear Power Div., Electric Power Res. Inst., Palo Alto, CA, USA).
Nucl. Saf. (USA), vol.24, no.3, p.293-318 (May-June 1983).
The philosophy, objectives, approach, and updated status of the Electric Power Research Institute's Light-Water-Reactor Safety Research Program are presented. In light of current industry needs, the major research and development emphases are described. The program focuses on providing enhanced capability, via large-scale test projects, for understanding and predicting the behavior of nuclear power plants. This leads to a realistic quantification of the safety margins and to ways of improving reliability, availability, and productivity and thus to significant economic benefits for the nuclear industry. The major accomplishments resulting from various projects in the program categories of risk assessment, code development and validation, and analysis and testing are presented with the goal of technology transfer to the nuclear industry. (90 refs.)

99699 On the coolability of degraded LWR cores. V.K.Dhir (Univ. of California, Los Angeles, CA, USA).
Nucl. Saf. (USA), vol.24, no.3, p.319-37 (May-June 1983).
Continued undercooling of the core of a light-water reactor can result in loss of integrity of the fuel pins and the structural materials in the core. In such a state the core may behave as a bed of volumetrically heated particles. Similar states of core debris may exist in the lower vessel head if in-place recovery does not occur or in the reactor cavity if the vessel fails but sufficient water exists in the cavity. The author reviews various models on coolability of debris beds submerged in a pool of liquid or subjected to upward flow of coolant.

Variables discussed are particle size, liquid subcooling, liquid-layer height, bottom cooling, particle-size distribution, and nonheated constituents. Heat fluxes predicted by various models for the porous layer to dryout are compared. (40 refs.)

99700 Failures in air-cleaning, air-monitoring, and ventilation systems in commercial nuclear power plants, 1978-1981. D.W.Moeller, L.-S.C.Sun (School of Public Health, Harvard Univ., Cambridge, MA, USA).
Nucl. Saf. (USA), vol.24, no.3, p.352-71 (May-June 1983).
An analysis of Licensee Event Reports (LERs) submitted by commercial nuclear power plant operators during the 4-yr period from 1978 through 1981 showed that 11 to 17% of those LERs reported by pressurized-water-reactor (PWR) installations and 20 to 29% reported by boiling-water-reactor (BWR) installations pertained to air treatment systems. The majority of these pertained to problems in air monitors. Problems with gaseous and particulate radiation monitors accounted for 68 and 41% of the air-monitoring events in PWR and BWR installations, respectively. Information available to prevent and/or correct these problems is not being effectively used, as is illustrated by the major role that human errors continue to play in these failures. As one solution to these problems, the authors recommend an increase in the training of both nuclear power plant personnel and staff members of the Nuclear Regulatory Commission in the areas of heating, ventilation, and air conditioning systems in general and nuclear air-cleaning technology in particular. (16 refs.)

99701 Evaluation of events involving unplanned boron dilutions in nuclear power plants. E.W.Hagen.
Nucl. Saf. (USA), vol.24, no.3, p.383-8 (May-June 1983).
Reviews and evaluates events concerned with the inadvertent dilution of boron concentrations to the reactor coolant system of pressurized-water-cooled thermal reactors in commercial service. The safety concern is the unplanned addition of reactivity. Results from information obtained were collated and analyzed for significance and impact on power plant safety performance. Several operating experience events are reviewed. This study revealed no boron dilution incidents resulting in a reactivity excursion or transient that scrammed a unit, nor was a reactor protection system challenged by any of the events. The most common cause for unplanned boron dilutions was human error of which one was a common-mode/common-cause failure. (15 refs.)

99702 Experimental investigations on the behaviour of main cooling pumps at loss-of-coolant accidents. W.Kastner, K.Riedle, G.Seeberger.
Brennst.-Waerme-Kraft (BWK) (Germany), vol.35, no.6, p.271-8 (June 1983). In German.
For an analysis of loss-of-coolant accidents in PWRs the stationary and transient behaviour of main cooling pumps during the flowing of single and two-phase media has to be known. Experiments in important parameter carried out on two axial, scaled down model pumps are described. The stationary experimental results show that the laws of similarity for pump behaviour at single-phase flow apply to two-phase flow, it volumetric steam content and pressure are taken into account. The results of the blowdown experiments correspond to the stationary measured values as long as no critical flow conditions occur. (6 refs.)

99703 Chemical equilibria for accident analysis in pressurised water nuclear reactor systems. P.E.Potter, M.H.Rand (Chem. & Materials Dev. Div., AERE, Harwell, England).
CALPHAD: Comput. Coupling Phase Diagrams & Thermochem. (GB), vol.7, no.2, p.165-74 (April-June 1983).
Some chemical equilibria for the safety analysis of water cooled nuclear reactors have been calculated using the programme SOLGASMIX. Particular attention has been paid to the behaviour of the fission product elements Cs, I, Te, Ba and Sr. The chemical states of these elements have been calculated for a variety of conditions likely to be encountered in the core of a reactor before and during degradation. (8 refs.)

99704 Some applications of holography at the Idaho National Engineering Laboratory. V.A.Deason (Instrument Dev. Branch, EG&G Idaho Inc., Idaho Falls, ID, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.353, p.131-7 (1983). (Industrial and Commercial Applications of Holography, San Diego, CA, USA, 24-25 Aug. 1982).
A project was recently completed that investigated possible uses of holography in the nuclear reactor safety program. A portable holographic camera which uses a pulsed ruby laser for illumination was constructed and used in various studies, including several designed to clarify the properties of steam/water mixtures that occur during loss-of-coolant accidents in nuclear reactors. The flexibility of the camera's optical configuration also enables it to produce holographic interferograms, which have several advantages over conventional interferograms and which can be used to measure very small physical changes in a given environment. (5 refs.)

99705 Four-inch pipe whipping tests under BWR LOCA conditions. Effect of pipe-restraints clearance. S.Ueda, R.Kurihara, T.Isozaki, N.Miyazaki, R.Kato, S.Miyazono, K.Saito.
J. At. Energy Soc. Jpn. (Japan), vol.25, no.5, p.383-93 (May 1983). In Japanese.
Describes results of the experimental and analytical research concerning the phenomenon of pipe whipping and the behavior of restraints to limit the pipe movement in a postulated loss-of-coolant accident of BWR nuclear power plants. The test pipe, which was made of type 304 stainless steel, was 114.3 mm in diameter and 8.6 mm in thickness. Four retraints of U-type were used. The rod of the restraint which was made of type 304 stainless steel, was 8 mm in diameter. The overhang length between the pipe exit and the restraints was 400 mm. The clearances between the pipe and the restraint were 30, 50 and 100 mm. In all the experiments the restraints limited the pipe movement. The residual restraint strain was less than the elongation of this material. The peak value of the pipe strain occurred near the restraints due to the rotation of the pipe after the impact. This value was less than the elongation of the pipe material. Calculations of the restraint strain, restraint force and the impact time were performed using the general purpose finite element program ADINA. (5 refs.)

99706 Experience with the peaceful use of nuclear energy. A.Birkhofer (Gesellschaft fur Reaktorsicherheit mbH, Garching, Germany).
Maschinenschaden (Germany), vol.56, no.3, p.69-79 (1983). In German.
The operating experience gained with nuclear plants in the western world is discussed including availability, accidents, radiation exposure and waste disposal. The extent and type of nuclear reactor accidents to date are debated with reference to the safety aspects of the power plants in the Federal Republic of Germany, including their treatment in the mass media. Finally the special role played by the human factor. (15 refs.)

99707 Numerical simulation of thermal-hydraulic transients in LMFBR piping systems. I.K.Madni (Mech. Engng. Dept., Univ., of Petroleum & Minerals, Dhahran, Saudi Arabia).
Numer. Heat Transfer (USA), vol.6, no.2, p.189-208 (April-June 1983).
The transient performance characteristics of liquid metal-cooled fast breeder reactor (LMFBR) systems are strongly influenced by the energy transport in the piping interconnecting the system components. A one-dimensional coolant-wall model is used to simulate the thermal transport processes, with energy equations. Formulated by using nodal heat balances. An implicit scheme is applied to the coolant equation with an explicit formulation of the wall heat flux, allowing the solution to march in the flow direction. The impact of uncertainties in Nusselt number predictions based on generally used correlations is examined. For coolant dynamics, each pipe run between components is treated as a lumped control volume. (26 refs.)

99708 NEA Library Programs on LWR Safety ANS 1982 Annual Meeting.
Newsl. NEA Data Bank (France), no.28 (Sept. 1982). [received: Aug. 1983]
Conference held at: Los Angeles, CA, USA. Date 6-11 June 1982. The following topics were dealt with: LWR safety; computer programs; BWR emergency cooling; LWR fuel rod behaviour; accidents; LWR blowdown analysis. Abstracts of individual papers can be found under the relevant classifcation codes in this or future issues.

99709 NORCOOL-I, a best-estimate model for BWR emergency cooling during reflood. I. P.Astrup (Dept. of Energy Technol., Riso Nat. Lab., Roskilde, Denmark).
Newsl. NEA Data Bank (France), no.28, p.5-46 (Sept. 1982). [received: Aug. 1983] (NEA Library Programs on LWR Safety ANS 1982 Annual Meeting, Los Angeles, CA, USA, 6-11 June 1982).
NORCOOL-I is a computer code for the calculation of the emergency core cooling transient for a BWR. The code considers both bottom flooding and spray cooling, and calculates the transient from the time where critical flow no longer exists. NORCOOL-I consists of a model for the heat conduction in the fuel rods and the structural materials and a model for the two-phase flow. The two-phase flow model includes separate descriptions of the water and steam phases and allows for thermodynamic non-equilibrium and counter current flow. The coupling between the heat conduction and the two-phase flow model is taken into account through a number of correlations for the heat transfer, which includes both convection and thermal radiation. (10 refs.)

99710 NORCOOL-I, a best-estimate model for BWR emergency cooling during reflood. II. J.Miettinen (Nuclear Engng. Lab., Tech. Res. Center of Finland, Helsinki, Finland).
Newsl. NEA Data Bank (France), no.28, p.47-72 (Sept. 1982). [received: Aug. 1983] (NEA Library Programs on LWR Safety ANS 1982 Annual Meeting, Los Angeles, CA, USA, 6-11 June 1982).
For pt.I see ibid., no.28, p.5 (1982). Describes the application of NORCOOL-I to emergency cooling systems such as top spray and reflooding experiments. An analysis of the 7th CSNI standard problem is also discussed. (3 refs.)

99711 SSYST—a code system to analyze LWR fuel rod behavior under accident conditions. W.Gulden (Projekt Nukleare Sicherheit, Kernforschungszentrum Karlsruhe GmbH, Karlsruhe, Germany), R.Meyder, H.Borgwaldt.
Newsl. NEA Data Bank (France), no.28, p.73-102 (Sept. 1982). [received: Aug. 1983] (NEA Library Programs on LWR Safety ANS 1982 Annual Meeting, Los Angeles, CA, USA, 6-11 June 1982).
SSYST (Safety System) is a modular system to analyze the behavior of light water reactor fuel rods and fuel rod simulators under accident conditions. It has been developed in close cooperation between Kernforschungszentrum Karlsruhe (KfK) and the Institut fur Kerntechnik und Energiewandlung (IKE). University Stuttgart, under contract of Projekt Nukleare Sicherheit (PNS) at KfK. Although originally aimed at single rod analysis, features are available to calculate effects such as blockage ratios of bundles and whole cores. A number of inpile and out-of-pile experiments were used to assess the system. (26 refs.)

99712 DRUFAN, an advanced best-estimate code for LWR blowdown analysis. M.Burwell (Gesellschaft fur Reaktorsicherheit mbH, Garching, Germany).
Newsl. NEA Data Bank (France), no.28, p.103-42 (Sept. 1982). [received: Aug. 1983] (NEA Library Programs on LWR Safety ANS 1982 Annual Meeting, Los Angeles, CA, USA, 6-11 June 1982).
DRUFAN-01/MOD2 computer program is a blowdown code for the simulation of loss-of-coolant accidents. The code can be applied to all possible blowdown geometries from a very simple one to complicated reactor systems. However, this code version is not meant to simulate phenomena where the non-homogeneous phase separation effects are important. (17 refs.)

99713 Inherent safety in liquid metal-cooled breeder reactors. R.T.Lancet, J.C.Mills (Atomics Internat. Div., Rockwell Internat., Canoga Park, CA, USA).
Greater Los Angeles Area Energy Symposium, Los Angeles, CA, USA, 28 Oct. 1980 (North Hollywood, CA, USA: Western Periodicals Company 1980), p.91-6
The major safety functions of a Liquid Metal Fast Breeder Reactor are reviewed. It is shown that these functions are carried out using diverse and redundant systems. Emphasis is placed on the approach of achieving the goal of providing at least one inherently actuated system for each major safety function. (no refs.)

28.50 FISSION REACTOR TYPES AND APPLICATIONS

99714 Advanced breeder systems—present status and prospects of development. I.G.Morozov.
Atomwirtsch.-Atomtech. (Germany), vol.28, no.7-8, p.400-7 (July-Aug. 1983). In German.
Delays in the use of breeders and the increased consumption of natural uranium this would entail could be offset in part by the introduction, on a larger scale, of thermal reactors, including converter reactors of the light water type with uranium-plutonium fuel and of the heavy water type with a uranium-thorium cycle. The most attractive and also the most promising strategy could turn out to be the three-component structure concept. In this case, the longer span required by nuclear power to become independent of natural uranium can, under certain conditions, be bridged by a reduction in capital outlay and by restricting the types of fuel cycles to only one uranium-plutonium cycle. (no refs.)

99715 Nuclear power developments and trends. J.J.Thompson, Z.J.Holy.
Energy 83. Towards an Energy Policy for Australia, Canberra, Australia, 11-13 May 1983 (Barton, Australia: Instn. Eng., Australia 1983), p.249-53
At the present time there are three types of nuclear reactors in commercial operation throughout the world, the light water reactor (LWR), the heavy water reactor (HWR), and the advanced gas cooled reactor (AGR). The latter has now been discontinued and the HWR has only been built in limited numbers. Currently, the LWR is the preferred system and makes up some 90% of nuclear plants in operation, under construction and planned throughout the world. The LWR system comprises two systems; the pressurised water reactor (PWR) and the boiling water reactor (BWR). Of these two types the PWR represents more than two-thirds of current nuclear plants in operation, and this proportion will increase when plants under construction and planned come into operation. In general, the nuclear fuel cycle for the PWR and BWR are similar, differing essentially in specific areas of fuel design and fuel management within the reactor core. The Canadian HWR, though highly successful, lies outside the main stream of development. (no refs.)

28.52 FUSION REACTORS

(for confinement, see 52.55)

99716 Heavy ion fusion. R.Bock (GSI Darmstadt, Darmstadt, Germany).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3049-54 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The heavy ion accelerator has been proposed as a driver for an inertial confinement fusion (ICF) power plant. The author presents the results of conceptual design studies for two accelerator scenarios: the RF-linac with storage rings and the induction linacs. Current and future experiments in heavy ion fusion are discussed. (18 refs.)

99717 Improvements on the HIBALL heavy ion fusion driver. I.Hofmann, A.Jahnke (Max-Planck-Inst. fur Plasmaphys., Garching, Germany), K.Beckert, D.Bohne, R.W.Muller.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3070-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Preliminary studies of accelerator scenarios suitable for the HIBALL heavy ion fusion reactor study have shown that it is of interest to consider an RF linac beam current as high as possible in order to reduce the filling time of the storage rings to about 1 msec. It is shown here for singly charged Bi ions (10 GeV kinetic, 5 MJ total energy) that such a scenario helps to avoid growth of the resistive microwave mode and reduces the complexity of transverse stacking manipulations in the rings. This work indicates that it might be desirable for future studies to lower the linac current and thus the enormous instantaneous RF power consumption by finding ways to suppress microwave growth in order to stretch the storage ring filling time. (6 refs.)

99718 The role of radiation damage analysis in the fusion program. D.G.Doran (Hanford Engng. Dev. Lab., Richland, WA, USA).
J. Nucl. Mater. (Netherlands), vol.117, p.1-3 (July 1983). (Proceedings of the Symposium on Radiation Damage Analysis for Fusion Reactors, St. Louis, MO, USA, 25-28 Oct. 1982).
The objective of radiation damage analysis is the prediction of the performance of facility components exposed to a radiation environment. The US Magnetic Fusion Energy materials program includes an explicit damage analysis activity within the Damage Analysis and Fundamental Studies (DAFS) program. The emphasis of this program is on developing procedures, based on an understanding of damage mechanisms, for applying data obtained in diverse radiation environments to the prediction of component behavior in fusion devices. It is assumed that the Fusion Materials Irradiation Test Facility will be available in the late 1980s to test (and calibrate where necessary) correlation procedures to the high fluences expected in commercial reactors. (5 refs.)

99719 Observation of compression of high-aspect-ratio shell targets in the DEL'FIN-1 laser-fusion device. N.G.Basov, A.A.Galichii, A.E.Danilov, A.I.Isakov, M.P.Kalashnikov, Yu.A.Merkul'ev, Yu.A.Mikhailov, A.V.Rode, G.V.Sklizkov, S.N.Fedotov.
JETP Lett. (USA), vol.37, no.2, p.134-9 (20 Jan. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.2, p.109-12 (20 Jan. 1983).
Experimental results on the compression of glass shell targets with an aspect ratio $R/\Delta R=150\text{-}250$ in the DEL'FIN-1 laser-fusion device are reported. The absorbed laser energy was $E=0.3\text{-}0.5$ kJ. The average shell velocity toward the center of the target was found to be $C=160$ km/s, and the maximum compression was $V_0/V_f=3.5\times10^3$. (6 refs.)

99720 A simple model of liner compression of plasma in a cylindrical system. A.Galkowski, R.Swierczynski, E.Wlodarczyk.
J. Tech. Phys. (Poland), vol.23, no.2, p.213-21 (1982).
Some numerical results previously obtained for a cylindrical compression system of deuterium plasma by concentric implosion of a cylindrical copper liner. Acceleration of the liner to a very high velocity was achieved by a layered explosion generator composed of a light shock absorbing layer spread over the imploding liner and an additional liner driven directly by the detonation products of the explosive. The transfer of the explosion energy access of the shock absorbing layer ensures profiled loading of the liner imploding into the deuterium region. The further optimisation of the system to attain higher neutron yield and the possibility of attaining a thermonuclear regime in a cylindrical explosion system are discussed. (10 refs.)

99721 Burn performance of deuterium-tritium, deuterium-deuterium, and catalyzed deuterium ICF targets. D.B.Harris, T.E.Blue (Fusion Studies Lab., Univ. of Illinois, Urbana, IL, USA).
Nucl. Fusion (Austria), vol.23, no.8, p.1071-7 (Aug. 1983).
The University of Illinois hydrodynamic burn code, AFBURN, has been used to model the performance of homogeneous D-T, D_2, and catalyzed deuterium

ICF targets. Yields and gains are compared for power-producing targets. AFBURN is a one-dimensional, two-temperature, single-fluid hydrodynamic code with non-local fusion product energy deposition. The initial conditions for AFBURN are uniformly compressed targets with central hot spots. AFBURN predicts that maximum D_2 target gains are obtained for target ρR and spark ρR about seven times larger than the target and spark ρR for maximum D-T target gains, that the maximum D_2 target gain is approximately one third of the maximum D-T target gain, and that the corresponding yields are approximately equal. By recycling tritium and ^{3}He from previous targets, D_2 target performance can be improved by about 10%. (11 refs.)

99722 Energy gain of D-T targets for inertial confinement fusion. S.Atzeni, A.Caruso (ENEA sulla Fusione, Centro Ricerche Energia Frascati, Rome, Italy).
Nucl. Fusion (Austria), vol.23, no.8, p.1092-7 (Aug. 1983).
A model for the computation of the minimum ignition energy and of the fuel gain of D-T targets which are isobaric at ignition is formulated, making use of the relevant ignition criterion. Scaling relations for the limiting gain curves, as functions of the energy delivered to the fuel, the fuel mass and the isentrope parameter, are given and illustrated by several examples. (15 refs.)

99723 Hydrogen recycling processes in plasma device. S.Yamaguchi (Dept. of Nuclear Engng., Tohoku Univ., Sendai, Japan).
Oyo Buturi (Japan), vol.52, no.3, p.220-6 (March 1983). In Japanese.
The fusion reaction that requires the lowest temperature and the least effective containment, and offers the prospect of the highest power densities, is one of deuterium and tritium. $D+T \rightarrow He+n+17.6$ MeV. Most of the energy released (14.1 MeV) is carried by the escaping neutron. Tritium is almost nonexistent in nature and must be regenerated in the fusion fuel cycle after use in deuterium-tritium (D-T) reaction. The author reviews recent studies on reflection, desorption, and retention/re-emission processes among the hydrogen recycling processes in nuclear fusion reactors, and briefly describes these processes. (22 refs.) *K.B.*

99724 The development of the Tokamak reactor in the light of new experimental results. K.Lackner (Euratom Assoc., Garching, Munchen, Germany).
Phys. Bl. (Germany), vol.39, no.7, p.211-19 (July 1983). In German.
The diverter type Tokamak fusion reactor has the advantage over the arrester type that the plasma remains uncontaminated by sputtered metal which is inevitably formed in an arrester type Tokamak. There are still to be solved many of the plasma-wall interaction problems, such as overheating of the diverter chamber and arrangement and shape of the exit slits with respect to higher heat generation and stronger plasma currents. (11 refs.) *R.S.*

99725 Geometrical efficiency of the prototype neutral beam injector unit for JT-60. Y.Ohara, M.Akiba, M.Araki, H.Horiike, M.Kuriyama, S.Matsuda, M.Matsuoka, Y.Okumura, S.Tanaka (Div. of Thermonuclear Fusion Res., JAERI, Ibaraki-ken, Japan).
Rev. Sci. Instrum. (USA), vol.54, no.8, p.921-7 (Aug. 1983).
The geometrical efficiency of the prototype neutral beam injector unit for the JT-60 was measured experimentally and was compared with numerical estimates. The measurements agreed well with the calculations in the wide range of perveance by taking into account the distortion of the beamlet intensity distribution function from a Gaussian distribution. Overdense operation of the ion source was preferable in that the high geometrical efficiency could be obtained at high perveance values. (12 refs.)

99726 Analysis of the surface and erosion of the graphite diaphragm of the T-3M Tokamak in the tearing mode. D.G.Baratov, G.V.Gordeeva, M.I.Guseva, V.N.Dem'yanenko, A.N.Mansurova, S.V.Mirnov, V.A.Stepanchikov, V.P.Fokin.
Sov. At. Energy (USA), vol.53, no.6, p.854-7 (Dec. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.6, p.396-8 (Dec. 1982).
A major difficulty in constructing large Tokamaks and Tokamak-reactors will be posed by the tearing-mode instability which manifests itself in fast expansions of the current channel (tears) right up to the diaphragms and walls of the discharge chamber. (6 refs.)

99727 Direct charged-particle energy conversion in a system composed of a magnetic expander and planar collector. S.K.Dimitrov, A.V.Makhin.
Sov. At. Energy (USA), vol.53, no.6, p.861-3 (Dec. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.6, p.400-1 (Dec. 1982).
Direct energy conversion should be used with charged particles emerging from plugs, in order to improve the efficiency of a fusion reactor based on an open trap and to solve the problem of cooling constructional components. The authors have examined the electron retardation in a conical magnetic expander with a planar collector. The electron beam, lay at the top of a conical vacuum chamber with a semivertex angle of 30° in the region of maximum magnetic field. (3 refs.)

99728 Use of two-dimensional schemes in the finite-element method in calculating the coil system for the toroidal magnetic field in a Tokamak. A.N.Podgornyi, P.P.Gontarovskii, B.F.Zaitsev, Ya.B.Naidenov, V.I.Koryavko (Inst. of Engng. Problems, Acad. of Sci., Kharkov, Ukrainian SSR).
Strength Mater. (USA), vol.14, no.7, p.908-12 (July 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.7, p.45-9 (July 1982).
The FEM has been used in two-dimensional schemes for determining the state of stress in the arch part of a coil system providing a toroidal magnetic field. There may be a deviation from contact between the coils when the system is subject to ponderomotive forces and a temperature distribution. The zones determined in this way from both schemes are similar. (12 refs.)

99729 Redundant control systems for TSTA. J.J.Damran (Los Alamos Nat. Lab., Los Alamos, NM, USA).
24th Midwest Symposium on Circuits and Systems, Albuquerque, NM, USA, 29-30 June 1981 (North Hollywood, CA, USA: Western Periodicals 1981), p.121-9
The tritium systems test assembly (TSTA) is a Los Alamos National Laboratory facility being constructed for the purpose of developing, demonstrating, and interfacing technologies required in the deuterium-tritium fuel cycle of future fusion reactor systems. The control of the facility is performed by the master data acquisition and control system (MDAC). The MDAC employs eight computers in a multi-redundant configuration ensuring both the safe and reliable operation of the facility and a high degree of system availability. To accomplish this task, MDAC is separated into two isolated branches, one designated as the process branch and the other as the safety branch. (no refs.)

28.58 INTEGRATED REACTOR SYSTEMS

99730 Target system for an intense neutron source using a spallation process.
J. At. Energy Soc. Jpn. (Japan), vol.25, no.5, p.344-55 (May 1983). In Japanese.
Two types of neutron emitting and breeding target systems were considered, those consisting mainly of heavy metals and molten salt containing fertile material like Th or U. Their performance studies have been made by applying a computational procedure for hadron transport incorporated with high energy fission. Structural models of a molten salt reactor system are presented for the future studies. A review is made of the neutron nuclear data in the energy range of tens-thousands MeV. Surveys have been also made for accelerators to supply sufficient protons to the target. These studies suggest three types of accelerators which will match each phase of the development and also be useful as themselves: (1) intense proton synchrotron like 'Gemini' now under study at KEK, (2) intermediate scale proton linac for the engineering study, (3) high power proton linac for the demonstration accelerator breeder system. (30 refs.)

28.70 NUCLEAR EXPLOSIONS

(see also 47.40 Shock and detonation phenomena)

99731 EMP, the electromagnetic superblitz: how safe are communications paths in emergencies?. A.Kukan.
Funk-Tech. (Germany), vol.38, no.6, p.235-7 (June 1983). In German.
The EMP (electromagnetic pulse) generation due to a nuclear explosion in the ionosphere can cause even on the earth surface fields strengths of 50 kV/m and play havoc with electronic installations and communications. At 500 km release height of a nuclear event, the whole of United States could be blanked out. The first USA tests of EMP consequences in 1962 are briefly described. Since 1977 a NATO specification list of equipment 'hardening' proposals exists; even partial protection or protection of key positions only requires enormous expenditure. Schematic diagrams illustrate the effects of an explosion by plots of electric and magnetic vectors vs. height, and the comparison of the EMP and a lightning discharge, the former having a faster time of rise, higher peak and wider frequency spectrum. Some simple safety circuit elements are discussed, like gas-filled surge fuses and Zener diodes. *A.L.*

28.80 RADIATION TECHNOLOGY, INCLUDING SHIELDING

(see also 87.60 Medical and biomedical uses of fields, radiations and radioactivity)

99732 Inter-laboratory standardization of glass dosimeters. S.K.Modgil, H.S.Virk (Dept. of Phys., Guru Nanak Dev Univ., Amritsar, India).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.367-70 (1 July 1983).
Intercalibration charts for various glass dosimeters have been prepared using Fleischer's glass as reference standard. Calibration constants have been deter-

mined using two different irradiation thermal neutron doses. The geometrical factor and uranium content for these glasses are determined. The U-content of the dosimeters varies from 0.35±0.02 ppm to 41.93±1.0 ppm and the geometrical factor *G* lies within the range 0.57-0.77. (12 refs.)

99733 Fast neutron detection with Al_2O_3 thermoluminescence dosimeter. M.Ranogajec-Komor (Inst. Ruder Boskovic, Zagreb, Yugoslavia), M.Osvay, I.Dvornik, T.Biro.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.383-6 (1 July 1983).
The technique of thermoluminescent (TL) dosimeter activation can be used to detect any radiation making TL dosimeters radioactive. In the experiment discussed in the paper Al_2O_3:Mg, Y TL dosimeters were irradiated by cyclotron neutrons with 5±1 MeV mean energy and by accompanying gamma rays. The gamma and the fast neutron component can be separately measured by the same dosimeter. Because of low neutron sensitivity of Al_2O_3 the gamma dose can be determined by the first TL reading while the $^{27}Al(n,\alpha)^{24}Na$ reaction provides the possibility of fast neutron detection by the subsequent reading of thermoluminescence induced in the TL material by the decay of ^{24}Na. (19 refs.)

99734 An alpha-particle imaging system for detecting plutonium contamination. T.Iida, S.Yamamoto, Y.Ikebe (Dept. of Nuclear Engng., Faculty of Engng., Nagoya Univ., Nagoya, Japan), A.Seki, K.Nakata, M.Ebana, M.Kanamori, M.Yoshida.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.413-18 (1 July 1983).
A new type of alpha-particle imaging system was constructed to reduce the time required for detecting plutonium contamination. The imaging system consists of a ZnS(Ag) screen, two tapered fibers, an image intensifier, and polaroid film. Spots due to single alpha-particles can easily be obtained on the polaroid film. The observed spatial resolution is more than 3 lp/mm. This system requires about one-seventh of the exposure time required by ZnS(Ag) autoradiography in order to distinguish between plutonium contamination and radon and thoron daughter products. (9 refs.)

99735 Enhanced intensity of 7.6 MeV gamma rays from an $^{241}Am/Be$ source in a multilayered CH_2-Fe shield. H.F.Atwater (Los Alamos Nat. Lab., Los Alamos, NM, USA).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.555-7 (1 July 1983).
Monte Carlo neutron-photon transport calculations were used in the empirical design of spherical shields that enhance the 7.6 MeV gamma-ray intensity from a shielded $^{241}Am/Be$ source. (5 refs.)

99736 The 'CBA' dosimeter for determination of high dose. Wu Zhili, Chen Xinwei (Shanghai Inst. of Nuclear Res., Acad. Sinica, Shanghai, China).
Nucl. Tech. (China), no.2, p.49-50, 60 (April 1983). In Chinese.
The authors study the effects of constituent concentration, chemical purity, irradiation temperature, absorbed dose and dose rate on dose response of the ethanol-chlorobenzene dosimeter in ^{60}Co γ-rays. The stability of the dosimeter before and after irradiation is also considered. The $G(Cl^-)$ values of 10 vol.% chlorobenzene-4 vol.% water system at different dose rates are given. Results show that such a dosimeter is suitable, in an irradiation plant, for the determination of ordinary dose within $10^3 \sim 10^5$ Gy. (3 refs.)

99737 Access control system in the Hamaoka Nuclear Power Station. H.Kaneda (Dept. of Radiat. Protection, Chubu Elec. Power Co., Nagoya, Japan), S.Shimura, K.Suzuki, T.Kitazawa.
J. At. Energy Soc. Jpn. (Japan), vol.25, no.5, p.356-71 (May 1983). In Japanese.
A new computerized system has been introduced to improve the function of radiation protection for those who enter the radiation control area, by dealing with the measurement of radiation dose, checking of personal qualification, resistration of working conditions and statistical treatment of these data. This system uses a combined TLD, 'TL BADGE', as a radiation detection sensor, instead of conventional pocket dosimeter and film badge. TL BADGE reading instruments are installed at the entrance to the control area and at working areas. The data of radiation dose, personal qualification, etc. read by the reading instrument are transmitted directly to the computer system, which compiles and transacts these data. This system consists of three minicomputers, double memory files, CRTs for effective data search and display and floppy disks as a medium for registration, etc. Thus the computer system improves its reliability and the maintainability of data, being capable of the automatical transaction of a great amount of data quickly. (15 refs.)

99738 Neutron dosimetry with spherical ionisation chambers. V. Experimental measurements and comparison with calculations of the cavity size dependence of the specific ionisation. A.Rubach (Univ. of Washington, Settle, WA, USA), H.Bischsel, A.Ito.
Phys. Med. & Biol. (GB), vol.28, no.8, p.913-24 (Aug. 1983).
For pt.IV see ibid., vol.27, p.1455, 1982. An experiment is described in which the cavity size dependence of the ionisation per unit mass was investigated in three different neutron beams for chambers with tissue equivalent walls filled with tissue equivalent gas or air and for graphite chambers filled with carbon dioxide. Different cavity sizes were achieved by changing the gas pressure in the ionisation chamber. Special care was taken with the measurement and analysis of saturation curves. It was found that the specific charge, *q*, changed with cavity size by 2% for the chambers with tissue equivalent walls and by more than 10% for the C/CO_2 chamber for mass diameters, τ, from 0.1 to 3 mg cm^{-2}. These results are in agreement with the results calculated in parts III and IV (Rubach and Bichsel 1982). (20 refs.)

99739 Radiation environment during the commissioning and power runup in the fifth unit at the Novyiu Voronezh nuclear power station. N.A.Verkhovetskii, V.P.Ivannikov, V.F.Kozlov, V.P.Kruglov, L.M.Luzanova, A.T.Pocevin, P.D.Slavyagin, L.P.Kham'yanov.
Sov. At. Energy (USA), vol.53, no.6, p.825-7 (Dec. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.6, p.373-5 (Dec. 1982).
The authors discuss the behaviour of the biological shield during commissioning and power run-up. Other areas were also examined for radiation penetration and levels. (3 refs.)

99740 A new method of monitoring radioactive aerosols from nuclear power stations with RBMK reactors. L.N.Moskvin, G.G.Leont'ev, S.N.Nekrest'yanov, A.P.Eperin, V.G.Shcherbina, A.G.Mokhnachev.
Sov. At. Energy (USA), vol.53, no.6, p.828-31 (Dec. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.6, p.376-8 (Dec. 1982).
A new method has been proposed for monitoring radioactive aerosols in the gases from nuclear power stations. It is possible to determine the activity α_{ji} or nuclide i at point j by multiplying the activity in the coolant α_{oi} by the dilution factor R_j, is found from the activity ratio for a base reference nuclide (B reference) at the given point of release and in the coolant in the first loop. When this scheme is realized, the monitoring sensitivity under normal operating conditions is increased by a factor 10^2-10^4, while the analysis times for the individual nuclides are reduced by factors of 10-100. 29.10 PREACCELERATION (INJECTION)

99741 A high current injector for the Boeing radiation laboratory FEL experiment. J.L.Adamski, W.J.Gallagher, R.C.Kennedy, A.D.Yeremian (Boeing Aerospace Co., Seattle, WA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2696-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A two-stage subharmonic injector has been designed and installed to accelerate 150 ampere micropulses with the Boeing 20 MeV, S-band linac. The accelerator will provide microbunches with interpulse time of 50 nanoseconds throughout the RF macropulse of 20 microseconds. The electron source is a 5 cm^2 triode electron gun which is gated to produce 5 A, 3 ns pulses. Two standing wave prebuncher cavities are used, the first at 119 MHz, the 24th subharmonic of the linac frequency, and the second at 476 MHz, the sixth subharmonic. A short tapered phase velocity traveling wave structure provides the final bunching. The solenoidal containment field is adjustable for optimization using injector profile diagnostics. Computer analysis of bunching and radial trajectories predict beams of 2.2 nanocoulombs with radius of 0.2 cm and phase width of $\pi/2$ of the fundamental at the entrance to the traveling wave section. (4 refs.)

99742 The advanced test accelerator (ATA) injector. C.H.Jackson, D.G.Bubp, T.J.Fessenden, R.E.Hester, V.K.Neil, A.C.Paul, D.S.Prono (Lawrence Livermore Nat. Lab., Livermore, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2725-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The ATA injector, developed from experience gained from the Experimental Test Accelerator (ETA) linac, has recently been completed. The injector consists of ten 0.25 MV cells that are used to develop 2.5 MV across a single diode gap. The 10 kA beam is extracted from a 500 cm^2 plasma cathode at average rates of up to 5 Hz and burst rates to 1 kHz. Pulsed power from 20 water filled blumleins is divided and introduced symmetrically through four ports on each cell. All major insulators are fabricated from filled epoxy castings. With these improvements, the ATA injector is smaller than the ETA injector; has a faster pulse response; has lower voltage stress on insulators and higher ultimate performance. Injector characterization tests began in October, 1982. These tests include beam current, energy, and emittance measurements. (2 refs.)

99743 Relativistic injection into a high-current betatron. F.S.Felber, D.Mitrovich, J.Vomvoridis, R.K.Cooper (Western Res. Corp., San Diego, CA, USA), A.Fisher, T.P.Hughes, B.B.Godfrey.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2781-3 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A method of injection into betatrons, which employs relativistic beams to overcome space charge limitations, is discussed. The method eliminates the need to modify the betatron with a toroidal magnetic field and avoids the attendant complications. More over, multiturn injection can reduce current and power requirements on the injector by orders of magnitude. Multiturn injection by RF linacs, however, may use a substantial fraction of the phase area in a betatron, which requires some means of painting the available phase space and missing the injector on subsequent turns. An example of such a betatron injection system is presented. (3 refs.)

99744 185-MeV injector design for the ANL 4-GeV microtron project. E.Colton (Phys. Div., Argonne Nat. Lab., Argonne, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3232-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The injector starts with a 5 MeV preinjector followed by an 18 MeV S-band linac. The 23 MeV electrons are transported and injected into a racetrack microtron via a 10° achromatic bend system. Twenty-seven turns are used to boost the energy to 185 MeV. Reverse-field stripes on the 180° end magnets

and quadrupole focusing on the return paths maintain a matched-dispersion free beam with transverse $\beta^*=5.0$ m in the center of the 4.6 m long linac. The beam is recirculated outside of the RTM linac to shear the longitudinal phase-space ellipse before extraction. The extracted beam is transported and injected into the six-sided microtron at 185 MeV. (4 refs.)

29.15 ELECTROSTATIC AND LINEAR PARTICLE ACCELERATORS

99745 RF characteristics of coupled split coaxial lines for RFQ structure. Y.Katayama, H.Takekoshi.
Bull. Inst. Chem. Res. Kyoto Univ. (Japan), vol.61, no.1, p.1-11 (March 1983).
The radio frequency quadrupole (RFQ) structure for injection of low velocity ions into a linear accelerator was studied. The structure consisted of coupled split coaxial lines. A full scale model of the RF cavity was made and the resonant frequencies and the RF field distributions were measured. At the lowest resonance, the transverse electric quadrupole was observed along the central axis of the cavity. The resonant frequency, the Q value and the shunt impedance of the cavity was investigated. In conclusion, the coupled split coaxial RFQ structure was as usuable as the four-vane RFQ structure, and the fabrication of the former is easier than that of the latter. (9 refs.)

99746 The improvement of electron electrostatic accelerator focusing performance. Ma Xinsheng, Jin Jialan (Shanghai Inst. of Nuclear Res., Acad. Sinica, Shanghai, China).
Nucl. Tech. (China), no.2, p.45, 54 (April 1983). In Chinese.
The improvement made on the electrostatic accelerator to enhance its focusing performance with a single potential lens is described. Since the improvement, the beam size has become smaller. The test results are given. (6 refs.)

99747 The Argonne tandem-linac accelerator system. L.M.Bollinger (Argonne Nat. Lab., Argonne, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2065-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Design considerations and operational experience for the existing heavy-ion accelerator consisting of a tandem injecting into a superconducting linac are summarized, with emphasis on the general features of the system. This introduction provides the basis for a discussion of the objectives and design of ATLAS, a larger tandem-linac system being formed by expanding the existing superconducting linac. (8 refs.)

99748 Upgrading the Heidelberg MP-tandem postaccelerator combination. M.Grieser, R.Hammel, B.Huck, H.Ingwersen, E.Jaeschke, R.Repnow (Max-Planck-Inst. fur Kernphys., Heidelberg, Germany).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2095-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The Heidelberg Tandem Postaccelerator Combination is undergoing a stepwise upgrading program intended to further considerably extend its mass and energy range as well as to increase the available intensity of heavy ion beams. In a first step in 1982 a resonator module of four newly developed $\beta=0.12$ spiral-split-ring resonators had been added to the high energy end of the linear accelerator. These resonators deliver RF-voltages of 0.5 MV (CW) and 1.0 MV (d.f.=0.25) each, increasing the effective acceleration voltage of the booster to 22.5 MV. To improve the performance of the accelerator system for heaviest projectiles two extensions are under construction. A 3 MV negative ion injector based on a reconstructed single ended pelletron accelerator is nearing completion. It is designed to facilitate the injection of well isotope separated low emittance beams of the highest masses into the low acceptance acceleration tubes of the MP-Tandem, thus reducing beam loading and allowing for considerably higher intensities of beams like ^{197}Au, ^{208}Pb, and ^{238}U. Later on a module of four $\beta=0.04$-spiral-split-ring resonators will be installed in front of the linac to match the velocity of heavy ions like ^{238}U to the presently operating machine. (5 refs.)

99749 Deceleration of highly stripped ions by the Heidelberg RF-postaccelerator. M.Grieser, R.Hammel, B.Huck, H.Ingwersen, E.Jaeschke, B.Kolb, R.Repnow (Max-Planck-Inst. fur Kernphys., Heidelberg, Germany).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2099-101 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The Heidelberg MP-tandem has been used to produce highly stripped ions of $S^{14,15,16+}$, Ni^{20+} and Br^{23+} which subsequently were decelerated by the normal conducting RF-postaccelerator. The minimum energy obtained so far in the deceleration mode is 0.15 MeV/amu for S^{15+}. Although the beam transmission is decreasing with decreasing final energy because of a longitudinal and transverse emittance growth, decelerated beams have been routinely used for atomic physics experiments. (9 refs.)

99750 Emittance calculations for the Stanford Linear Collider injector. J.C.Sheppard, J.E.Clendenin, R.H.Helm, M.J.Lee, R.H.Miller (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA), C.A.Blocker.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2161-3 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A series of measurements have been performed to determine the emittance of the high intensity, single bunch beam that is to be injected into the Stanford Linear Collider. Online computer programs were used to control the linac for the purpose of data acquisition and to fit the data to a model in order to deduce the beam emittance. The paper describes the method of emittance calculation and presents some of the measurement results. (4 refs.)

99751 Water-cooled target box design at LAMPF. D.Grisham, J.Lambert (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2270-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The target boxes in the main experimental beam line (Line A) at the Clinton P. Anderson Meson Physics Facility (LAMPF) have operated since 1976. A program of replacing the boxes is underway. This paper will present past history, design considerations, calculational results and the final box design. (1 ref.)

99752 Status of the SLAC SNOOP Diagnostic Module for FASTBUS. H.V.Walz, D.B.Gustavson (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2276-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A SNOOP Diagnostic Module for FASTBUS is under development at SLAC. The SNOOP Module resides on a FASTBUS crate segment and provides diagnostic monitoring and testing capability. It consists of a high-speed ECL front-end to monitor and single-step segment operations, a simple master interface, and a control processor with two serial communication ports. Module features and specifications are summarized, and prototype hardware is shown. (8 refs.)

99753 Computer-automated Linac diagnostics and data acquisition. A.Yeremian, J.Adamski, D.Shoffstall (Boeing Aerospace Co., Seattle, WA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2279-80 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Computer interactive diagnostics have been developed and tested for measuring RF Linac electron beam position and emittance. Electron beam position is measured with ferrite-loaded stripline monitors. The measured signals are processed by an APPLE-II computer, displayed and updated (at the Linac repetition rate) on a monitor. Data to determine emittance is collected by measuring electron beam spot size (using the wire scanner technique) as the focal strength of a quadrupole triplet is adjusted around the focus at the scanner. The emittance is calculated by the APPLE-II making a hyperbolic curve fit to these data. (2 refs.)

99754 The use of a commercial data base management system in the LAMPF control system. S.K.Brown (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2302-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The control system for the accelerator at the Los Alamos Meson Physics Facility (LAMPF) is currently being upgraded to run on a DEC VAX 11/780. To unify the several disparate control hardware protocols into one consistent software protocol requires that the hardware devices be addressed logically rather than physically, the physical connections being supplied by the control system. To accomplish this, the control system must have some link between the devices' logical names and their physical connections. This link is supplied by a data base which is managed by a commercial data base management system. This paper discusses the reasoning behind the choice of a commercial system, the particular DBMS chosen and some of the pros and cons of using the DBMS as well as some of the author's experiences trying to join tools of the commercial world with the real-time world. (2 refs.)

99755 Data acquisition software for the LAMPF control system. S.C.Schaller, P.A.Rose (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2308-10 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
As part of the upgrade of the Los Alamos Meson Physics Facility (LAMPF) control computer, the software providing the interface between application programs and the accelerator hardware was redesigned. This new Data System design—which handles more than 12000 widely different devices—allows greater uniformity, flexibility, maintainability, and hardware independence than before. The Data System portion of the LAMPF Control System is described. (2 refs.)

99756 Automatic tuning of the LBL SuperHILAC third injector transport line. H.Pines (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2314-16 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Testing of a new automatic tuning procedure in an LBL SuperHILAC beam transport line has been conducted with the third injector microcomputer control system. The computer performs steering/focusing adjustments simultaneously on a number of quadrupole and dipole magnets comprising mul-

iple-station sections of the injection line. New magnet currents are computed from equations governing beam optics in a real-time simulation of the beam line. The key to this technique is the calculation of beam transverse emittance utilizing the same control magnets and beam profile monitors used for manual tuning of the line. This emittance calculation requires high resolution beam profile measurements using multiwire profile monitors recently installed in the third injector line. (2 refs.)

99757 Application of local area networks to accelerator control systems at the Stanford Linear Accelerator. J.D.Fox, E.Linstadt, R.Melen (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2317-19 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The history and current status of SLAC's synchronous data link control (SDLC) networks for distributed accelerator control systems are discussed. These local area networks have been used for instrumentation and control of the linear accelerator. Network topologies, protocols, physical links and logical interconnections are discussed for specific applications in distributed data acquisition and control systems, computer networks and accelerator operations. (6 refs.)

99758 On-line control models for the Stanford Linear Collider. J.C.Sheppard, R.H.Helm, M.J.Lee, M.D.Woodley (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2320-2 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Models for computer control of the SLAC three-kilometer linear accelerator and damping rings have been developed as part of the control system for the Stanford Linear Collider. Some of these models have been tested experimentally and implemented in the control program for routine linac operations. The authors describe the development and implementation of these models, as well as some of the operational results. (4 refs.)

99759 A new control system for the SLAC accelerator klystrons for SLC. R.K.Jobe (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2325-7 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A general overview of a new control system for SLAC klystrons is presented along with a detailed description of the remote controller for measurement and control of accelerator components. (3 refs.)

99760 An interactive alarm system for the CERN PS accelerator complex. J.Cuperus (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2337-9 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The new CPS controls system started operation in 1980 and is gradually being extended to control several accelerators and beam lines of the CPS complex. Part of the system and growing with it is a data-base driven alarm system. In each front-end computer, a program monitors the equipment, another the CAMAC interface and a third the beam currents. These programs send data to a central computer. In general-purpose consoles, a screen and touch-panel are dedicated to the alarm system. The alarms are displayed in various formats and levels of detail according to the wishes of the operator, who can also attempt automatic reset of individual faults or groups of related faults. Except for beam current monitoring, no details about the equipment are coded in the programs. The list of the equipment to be checked and information about it are stored in an off-line data base from which the necessary real-time files can be derived automatically. The result is a powerful and unified alarm system which can be easily maintained and updated. (2 refs.)

99761 Solution to the transverse phase space time dependence problem with LAMPF's high intensity H^+ beam. J.Hurd (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2487-8 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The 750 keV H^+ beam at LAMPF has a transverse phase space time dependent transient during the first 200 μs of each 750 μs long macro-pulse. The time dependence is documented in an earlier report (Hurd and Browman, 1981). Further studies indicate that the time dependence is due to space charge neutralization resulting from secondary emission of electrons produced by collisions of the H^+ and $H_2{}^+$ beams on the transport walls. One of several possible solutions has been tested and has proven successful in eliminating the time dependence of the beam entering the linac. (1 ref.)

99762 The present status of the Daresbury nuclear structure facility. R.G.P.Voss (Sci. & Engng. Res. Council, Daresbury Lab., Daresbury, Warrington, England).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2680-4 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The development of the Daresbury nuclear structure facility since 1973 is described, including the construction and voltage tests. The successful running of various ion beams for experiments is now underway. (12 refs.)

99763 A 35-MV tandem Van de Graaff—the Vivitron. M.Letournel (CRN, Strasbourg, France).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2713-15 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The Strasbourg project is a 35 MV Van de Graaff tandem whose design incorporates some new features and ideas. All the electrical characteristics are very conservative, especially for the accelerating tube which is a standard one, but the philosophy and some rules to build such an accelerator are new. (1 ref.)

99764 IBEX foilless diode experiments. R.B.Miller, M.G.Mazarakis, J.W.Poukey (Sandia Nat. Labs., Albuquerque, NM, USA), R.J.Adler.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2722-4 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A new high voltage isolated Blumlein accelerator (IBEX) has been designed and constructed. A new accelerator pulse-forming-line (PFL) configuration produces an output voltage pulse equal to the PFL charge voltage for a matched load (as in a conventional Blumlein circuit); however, the prepulse level is negligible and both sides of the diode remain at electrostatic ground potential. With a matched planar diode load, IBEX has generated a 4 MeV, 100 kA electron beam. In the present stage of experimentation, a foilless diode load is being used to produce 3-4 MeV, 20-30 kA annular electron beams with an applied magnetic field strength of ~10 kG. (7 refs.)

99765 PHERMEX electron gun development. L.A.Builta, J.C.Elliott, D.C.Moir, T.P.Starke, C.A.Vecere (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2728-30 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The PHERMEX facility is a 50-MHz standing wave linear accelerator. The authors describe the progress of PHERMEX electron gun development. The goal of this program is to generate and transport a 200-ns, 1-MV, 1-kA electron beam into the first PHERMEX accelerating cavity. The standard gun is operated at a pulse voltage of 550 kV, which is the limit determined by internal breakdown of the vacuum insulator. This insulator has been redesigned, and the gun has been pulsed at 750 kV without internal breakdown. The current output is not limited by voltage but by a phenomenon called pulse shortening, which occurs at a pulse voltage of approximately 650 kV. The phenomenon has been investigated and the results are presented. (5 refs.)

99766 Modelling of multiple electrode Van de Graaff generators with up-charge and down-charge processes. J.Takacs (Nuclear Phys. Lab., Univ. of Oxford, Oxford, England).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2749-53 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Van de Graaff generators with multiple electrodes came about as a result of the demand for ever increasing voltages in various fields of science. The transient behaviour of these generators is mostly determined by their internal electrode arrangements. In the analysis given here these effects are divided into two categories; the effect of the column electrode structure and that caused by the large intermediate shields. The modelling shown here takes into consideration both effects and shows the way of analysing these high voltage generators with up to n internal electrodes. The results show the striking difference in behaviour of these generators with up-charge and down-charge processes. The numerical example given was based on one of the existing Van de Graaff generators in Oxford. (9 refs.)

99767 Mechanical design of the high-energy beam-transport line for the FMIT 2-MeV accelerator. D.Lisk, L.Carlisle, F.Sigler, J.McCormick, D.Greenwood, R.Grieggs, J.Uher, G.Zimmerman (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2824-6 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The beam-transport line for the high-power 2-MeV Fusion Materials Irradiation Test (FMIT) accelerator is one of the most heavily instrumented ever designed. A wide variety of diagnostics is required to accurately determine the characteristics of the beam that will ultimately be used. Because the machine is only 2 MeV, the packing factor in the high-energy beam transport (HEBT) is high, especially since full-scale FMIT-grade components are used where possible. The HEBT's mechanical design aspects and its instrumentation are described. (2 refs.)

99768 An adiabatic matching device for the Orsay linear positron accelerator. R.Chehab, G.Le Meur, B.Mouton, M.Renard (Lab. de l'Accelerateur Lineaire, Univ. de Paris-Sud, Orsay, France).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2850-2 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
An adiabatically tapered solenoidal magnetic field is used to match positron beam source emittance to accelerating section acceptance. Such a matching system improves the accepted energy band which has been accurately computed and compared with analytical determination. The tapered field is provided by stacked pancakes and solenoids of various radii; total lens length is about 0.75 m. The adiabatic matching system took place of a quarter wave transformer system and has been in operation for two years. Positron conversion ratio is 3.3% for a 1 GeV incident electron beam and presents a factor of nearly 2.5; the output positron beam energy is of 1.2 GeV. (4 refs.)

99769 Characteristics and transport of a proton beam generated in a linear induction accelerator. I.S.Roth, J.A.Nation (Lab. of Plasma Studies & School of Electrical Engng., Cornell Univ., Ithaca, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2853-5 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A seven Ohm Blumlein has been used to generate a proton beam in an induction linac using a single magnetically insulated accelerating gap. The proton beam generated has an energy of up to 1.3 MeV at 4.0 kA and a pulse duration of 50 nsec. The authors report measurements of the beam characteristics and beam transport. Lack of complete neutralization was apparent and a modified system which relies on collective focusing of the ion beam by an electron cloud in an axial magnetic field has been developed. First results obtained using the collective focusing show evidence of improved transport over, at least, short distances. Further measurements are needed to confirm the adequacy of the present system for transport over the scale lengths needed for a multi-gap accelerator. (12 refs.)

99770 Discrete precision beam switching in linear induction accelerators through harmonics control. K.Denno (New Jersey Inst. of Technol., Newark, NJ, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2915-17 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Continued development in inertial fusion reactor research identifies the potential of providing beam of heavy ions associated with long pulse duration, low level of kinetic energy and multi-kiloamperes current. The author presents a continuation of work for the ultimate goal of precision design in the spark gap switching mechanism for the linear induction accelerators including the core type as well as the line type. The pulse switching involves the utilization of the saturable-resistor with hard ferromagnetic material core, where sudden changes in its ohmic value can provide precise automatic switching synchronized with that of the charging beam. Calculations centered on establishing remarkable switching sequence spectrum with respect to the fundamental frequency as well as for a discrete sequence of harmonics contained in the saturable-resistor exciting current. Discrete time switchings are characterized in the form of discrete pulses with continuous ascending sharp increase in amplitude and controlled reduction in time duration. (7 refs.)

99771 Industrial and medical applications of accelerators with energies less than 20 MeV. J.L.Duggan (North Texas State Univ., Denton, TX, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3039-43 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The medical and industrial application of small accelerators is reviewed. The areas covered will include medical linacs, cyclotron design and production of medical radioisotopes, radiation processing, ion implantation for the metallur-

gical and semiconductor industries, oil and mineral exploration, trace, surface and bulk analysis and unique accelerators for all of the above applications. (34 refs.)

99772 Multistage pulsed-power electron accelerators. K.R.Prestwich, D.E.Hasti, R.B.Miller, A.W.Sharpe (Pulsed Power Appl. Dept., Sandia Nat. Labs., Albuquerque, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3155-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Pulse power developments in high-current linear accelerators (RADLAC I) and low impedance water transmission lines (PBFA I) are reviewed. The design of Hermes III, a 1.1 MA, 15 MV linear accelerator based on these technologies is discussed and initial data on the development of this accelerator is presented. (14 refs.)

99773 Simulation of preaccelerated particles in the plasma beatwave accelerator. D.J.Sullivan (Mission Res. Corp., Albuquerque, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3159-61 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
One-dimensional relativistic and electromagnetic simulations show the Plasma Beatwave Accelerator to be a viable approach to obtaining large accelerating fields. The plasma wave excited by Raman Forward Scattering has a longitudinal electric field on the order of 100 MeV/cm to 10 GeV/cm based on plasma densities of 10^{16} cm^{-3} to 10^{20} cm^{-3}. The use of optical mixing to grow a plasma wave of the proper frequency above the noise level greatly reduces the laser intensity needed to drive the Raman instability. TeV energies for plasma electrons or preaccelerated charged particles in short distances appear feasible. Results where an injected electron beam is accelerated coherently from 1 MeV to 20 MeV in one millimeter are presented. Two- and three-dimensional effects must still be resolved. (11 refs.)

99774 The radio-frequency coaxial linear accelerator for high-current hollow beams. P.Krejcik (KFI Julich GmbH, Julich, Germany).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3168-70 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A structure with modulated coaxial electrodes accelerates a hollow beam and is able to provide strong focusing over the annular aperture of the beam, making it suitable for high beam currents. The theory for this transport system is presented and experimental investigations described. (6 refs.)

99775 Collective electron driven linac for high energy physics. J.T.Seeman (Lab. of Nuclear Studies, Cornell Univ., Ithaca, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3180-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A linac design is presented in which an intense ultrarelativistic electron bunch is used to excite fields in a series of cavities and accelerate charged particles. The intense electron bunch is generated in a simple storage ring to have the required transverse and longitudinal dimensions. The bunch is then transferred to the linac. The linac structure can be inexpensively constructed of spacers and washers. The fields in the cells resulting from the bunch passage are calculated using the program BCI. The results show that certain particles within the driving bunch and also trailing particles of any sign charge can be accelerated. With existing electron storage rings, accelerating gradients greater than 16 MV/m are possible. Examples of two accelerators are given: (1) A 30 GeV electron/positron accelerator useful as an injector for a high energy storage ring and (2) a 110 GeV per beam electron-positron collider. (10 refs.)

99776 Self-trapping electron ring accelerators. G.Gisler, R.Faehl (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3204-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Simulations performed with a fluid MHD extension to the PIC plasma code CCUBE show that it is in principle possible to design liner-driven ring accelerators so that they generate their own trapping well. The liner elements are tapered in mass and respond in a predictable way to the driving acceleration. Currents arise as the liner moves through an imposed axial field, and if the liner shape is appropriate, a magnetic trapping well results. A cusp-injected electron ring is then introduced, trapped, and accelerated to high energies. (no refs.)

99777 Laser beat-wave accelerator for ultra-high energies. TG.Tajima (Dept. of Phys., Univ. of Texas, Austin, TX, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3209-11 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Parallel intense laser beams ω_0,k_0 and ω_1,k_1 shone on a plasma with frequency separation equal to the electron plasma frequency ω_{pe} capable of creating a coherent large longitudinal electric field $E_L=\gamma_\perp^{1/2}$ mc ω_{pe}/e of the order of 1-10 GeV/cm for plasma density 10^{18-20} cm^{-3} through the forward Raman scattering. A concept of applying this process to an ultra-high energy (100-1000 TeV range) accelerator is considered. Associated physics questions such as the laser beam propagation, self-trapping, filamentation, and longitudinal dephasing , etc., are discussed. As a method to overcome the longitudinal dephasing, the relativistic forward Brillouin scattering process is proposed, where the frequency separation of two lasers is now ω_{pi} with ω_{pi} being the ion plasma frequency. (7 refs.)

99778 A transverse-field-focusing (TFF) accelerator for intense ribbon beams. O.A.Anderson, D.A.Goldberg, W.S.Cooper, L.Soroka (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3215-17 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
In a TFF accelerator, a transverse electric field is set up between pairs of curved deflecting plates. Charged particles passing between the plates are both deflected and strongly focused by the field. Average-straight-line motion is obtainable by having the successive pairs of plates curve in alternating directions (with corresponding reversal of the field). Acceleration is achieved by adjusting the mean voltage on each succeeding pair of plates. Computer simulations are in good agreement with the analytically calculated beam dynamics; they show no evidence of beam instabilities and almost no emittance growth. A design for a 400 keV, 8 A/meter, single-ribbon DC accelerator is presented. (10 refs.)

99779 SORE—a pulse stretcher for the Saskatchewan 300-MeV linac. J.C.Bergstrom, H.S.Caplan, R.V.Servranckx (Accelerator Lab., Univ. of Saskatchewan, Saskatoon, Saskatchewan, Canada), B.E.Norum.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3226-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A design study has been made of a pulse stretcher to increase the duty factor of the 300 MeV electron accelerator of the Saskatchewan Accelerator Laboratory. The design was constrained by the desire to house the pulse stretcher within the existing accelerator building and to make maximal use of existing beam transport lines. Only minor alterations will be required to the accelerator vault architecture and a minimal length of additional beam transport lines will be required. The parameters of the extracted beam will be good. Preliminary calculations indicate that a transverse emittance of 0.3 π mm-mr should be attainable in the horizontal plane. The vertical emittance of the extracted beam will be determined primarily by that of the injected beam since both injection and extraction occur in the horizontal plane. The energy spread of the beam will be of the order of 0.1% when the monochromatic extraction technique is employed. (4 refs.)

99780 A plasma wave accelerator—Surfatron. I. T.Katsouleas, J.M.Dawson (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3241-3 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The limitation on the total energy gain possible with recent plasma accelerator schemes such as the beam-wave accelerator of Tajima and Dawson (1979) is overcome by the Surfatron. By introducing a perpendicular magnetic field it is possible to keep particles in phase with the laser-induced plasma waves and hence accelerate them to arbitrarily high energy. (6 refs.)

99781 A plasma wave accelerator—Surfatron. II. W.Mori, C.Joshi, J.M.Dawson (Dept. of Electrical Engng., Univ. of California, Los Angeles, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3244-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
For pt.I see ibid., vol.NS30, p.3241 (1983). With the advent of high power lasers it has become possible to generate fast large-amplitude electrostatic waves in a plasma. These waves have been the basis for several accelerator schemes. Inherent in all these schemes is the limitation that the particles eventually outrun the wave. Therefore, although the plasma wave has an enormous electric field, the particles only interact with the field for a limited length of time. Straightforward calculations show that in either the wake plasmon or the beat wave accelerator schemes the maximum obtainable energy is $2(\omega/\omega_p)^2mc^2$ and that this energy is obtained in a time which is roughly $2(\omega/\omega_p)^2 1/\omega_p$. Here ω represents the incoming laser frequency and ω_p represents the plasma frequency. Theory and computer simulations are presented which demonstrate that, when a magnetic field is inserted perpendicular to the direction of wave propagation, the particles remain in phase with the wave. (4 refs.)

99782 Accelerator development at Bates. C.P.Sargent (MIT Bates Linear Accelerator, Middleton, MA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3262-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The past year has seen the completion of a major expansion of the Bates Accelerator Laboratory. A second experimental hall (the South Hall) and several magnetic spectrometers have been constructed. These now allow extension of the experimental program beyond the area of high-resolution electron scattering which has been the main activity to date. The accelerator's maximum energy has been increased from 400 MeV to 750 MeV by means of beam recirculation. A current two-year project for the fabrication of an additional RF transmitter plus a 30% increase in RF peak power capability will increase energy further to approximately 1 GeV. During the same period pulse-to-pulse beam sharing between high-resolution spectrometer area and South Hall will become available. As part of an experiment on parity violation in elastic electron scattering, a Yale University-CUNY group has constructed a polarized electron source which will be installed during 1983. (4 refs.)

99783 Microwave matching and tuning on the 20-MeV medical electron linac with feedback of RF power. Wang Yuan-ling (Dept. of Phys., Univ. of Nanjing, Nanjing, China).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3463-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
In a linac with feedback (or with the resonator) the reflection affects the energy gain of the electron and the performance of the accelerator. By means of the theory of the traveling wave resonator, the field multiplication factor and the reflection coefficients inside and outside the feedback ring are calculated. The bands of the linacs without and with feedback are measured. In order to achieve a desirable band, in front of the load (i.e. outside the feedback ring) a matching iris is added. After the linac with feedback has been matched the band is given. (4 refs.)

99784 CW side-coupled linac for the Los Alamos/NBS racetrack microtron. L.M.Young, J.M.Potter (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3508-10 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A 2.7-m side-coupled linac has been built as part of the 5-MeV injector for the CW room-temperature racetrack microtron (RTM) being constructed in collaboration with the National Bureau of Standards (NBS). The linac is designed to accelerate the electron beam from 1 to 5 MeV with an accelerating gradient of 1.5 MeV/m. Fabrication of the structure started October 4, 1982 and was completed February 28, 1983, when it was tested with a CW power level of 82 kW. The structure has an effective shunt impedance (ZT^2) of 82.5 MΩ/m. No change in field distribution was detected at any power level. The operating frequency is 2380 MHz. (4 refs.)

99785 High power integral RF linac cavities. D.Mitrovich, F.Felber, P.Wilson, R.Cooper (Western Res. Corp., San Diego, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3518-20 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Accelerating a long train of high current pulses requires a very large power flow from cavity to beam. Several advantages exist when this large RF power is supplied to the accelerating cavities at the same high rate at which the beam is extracting it. A particular approach to accomplishing this, the wake field transformer concept of Voss and Weiland, as applied to the parameter regime of interest is examined. Several high current, low energy (few MeV) beams injected off-axis into the cavity are decelerated by their own and

receding fields. The resulting RF energy in the proper mode accelerates a lower current, high energy beam on-axis. Mode generation by an idealized annular beam is calculated as a function of driving current pulse width, cavity length, and radius of the annulus. Optimal pulse width is about half the wavelength of the TM_{010} accelerating mode, and the efficiency maximized for annulus radius equal to about two-thirds the cavity radius. Analysis of the beam dynamics shows that an axial magnetic field of the order of 1 kG is adequate to guide the annular power beam. (7 refs.)

99786 RFQ linac structure developments at CRNL. R.M.Hutcheon, L.D.Hansborough, K.J.Hohban, S.O.Schriber (Chalk River Nuclear Labs., AECL, Chalk River, Ontario, Canada).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3521-3 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Modeling studies of RFQs for a 300 mA CW proton accelerator are continuing at CRNL. Initially, low power models of the four-vane structure with standard end terminations were extensively investigated. Later, results of simple RF dipole experiments led to studies of two new RFQ termination schemes, the double dipole (in which too opposing vanes were shorted at both ends) and the folded dipole (in which one set of opposing vanes was shorted at one end, and other vane set shorted at the other end). Various end tuner configurations were also tested, including radial end tuners and Bourdon tube mechanisms for remote positioning. Finally, a versatile low power RFQ model has been built to study RF properties with reproducible vane geometry. (4 refs.)

99787 The fermilab RFQ project. D.Neuffer, C.D.Curtis, F.R.Huson, Q.A.Kerns, A.Martinez, C.W.Owen, C.W.Schmidt, E.Treadwell, G.J.Villa (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3527-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A 200 MHz Radio Frequency Quadrupole (RFQ) Linac is being designed and constructed for the acceleration of H^- ions from 30 keV to 750 keV at a current of 30 mA. The RFQ is being developed as a possible placement for the Fermilab preaccelerator and as R and D project to investigate RFQ properties for future accelerators. The current status of the project is described. (7 refs.)

99788 A spiral-resonator radio-frequency quadrupole accelerator structure. R.H.Stokes, J.M.Potter, F.J.Humphry, P.L.Roybal (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3530-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A radio-frequency quadrupole (RFQ) structure operating at low frequency has been developed for possible use in accelerators for heavy ion fusion or Tokamak plasma heating. The structure uses a series of shunt spiral inductors placed periodically along the electrodes of an electric quadrupole to achieve resonance at the desired frequency. A 1.2-m-long model has been constructed for low-power testing. The model resonates near 12 MHz and has radial dimensions that are reduced by a factor of 15 compared to the commonly used four-vane resonator. (2 refs.)

99789 Beam dynamics and wave geometry in the LBL heavy ion RFQ. J.Staples (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3533-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The LBL Heavy ion RFQ accelerator, presently undergoing acceptance tests, extends the application of the RFQ principle to charge-to-mass ratios considerably less than one. In this design the aperture is very small compared to the operating wavelength, causing a large capacitive loading of the structure and also in a high sensitivity of the field configuration of the structure to vane alignment. A structure has been derived that eases the vane alignment procedure and reduces the sensitivity to vane misalignment. The selection of the vane cross section facilitates machining and eventual frequency trimming. (8 refs.)

99790 Status of the Frankfurt zero-mode proton RFQ. A.Schempp, P.Junior, H.Klein, M.Daehne, M.Ferch, K.Langbein, N.Zoubek (Inst. fur Angewandte Phys., Univ. Frankfurt/Main, Frankfurt/Main, Germany).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3536-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The O-mode RFQ consists of 4 trapezoidally modulated electrodes, manufactured on a lathe and periodically supported by radial stems. This resonator is excited in π-O-mode forming an RFQ field, which is highly stable against tolerances and dipole-modes. A compact proton accelerator (10-300 keV, 108 MHz) with high duty cycle has been built and RF properties and first beam measurements are presented. New sparking experiments and results of high power tests with a 18 MHz spiral-RFQ are discussed. (14 refs.)

99791 Integral radial stems on aluminium $\beta=1$ disk-and-washer structures. S.O.Schriber (Chalk River Nuclear Labs., AECL, Chalk River, Ontario, Canada).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3539-41 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Aluminum test cavities were manufactured with integral radial stems to support the washers of a $\beta=1$ 2500 MHz disk-and-washer structure. Difficulties in making stem joints were therefore eliminated. From one to four integral stems were studied. Measurements showed that four stem supports was best and that two stems mounted at 180° to each other created RF problems. The frequencies of higher order mode passbands can be shifted to result in a structure with good RF efficiency, coupling and quality factor for the $\pi/2$ operating mode. (11 refs.)

99792 Disk-and-washer linac structure with biperiodic T supports. Y.Iwashita (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3542-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The disk-and-washer (DAW) linac structure with particular biperiodic washer-support geometries promises to be an excellent structure for $B>0.5$ accelerator applications. Outstanding features of this structure include high efficiency, high stability, good vacuum properties, and ease of fabrication. (5 refs.)

99793 Additions and improvements to the RF cavity code SUPERFISH. S.O.Schriber, R.F.Holsinger (Chalk River Nuclear Labs., AECL, Chalk River, Ontario, Canada).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3545-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
SUPERFISH is a computer code that is used extensively to determine RF properties or RF strucures. The authors describe a new post processor for SUPERFISH that determines temperature distributions in the metal enabling high average power RF characteristics for various cooling configurations to be examined. Different materials can be incorporated for different parts of the cavity geometry. Sample results for geometries including drift tube linacs and coupled cavity linacs are presented. Other improvements to the code give electric fields at all vacuum mesh points, normalized RFQ geometry parameters, and transit time factors (T_0, T_1, T_2, S', $\tilde{S}$, $\bar{S}$, S_0 and S_0) associated with off-axis electric fields for MAPRO beam dynamics codes. (7 refs.)

99794 A highly efficient interdigital-H-type resonator for molecular ions. T.Weis, H.Klein, A.Schempp (Inst. fur Angewandte Phys., Univ. Frankfurt/Main, Frankfurt/Main, Germany).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3548-50 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
For accelerating molecule ions with low charge to mass ratio highly efficient resonators are needed to keep the accelerator length short and to decrease power consumption. Therefore the authors used a modified interdigital-H-type structure (TE_{111} excitation) to build a high power prototype for CO^+ molecules. They measured a surprisingly high bare shuntimpedance of 700 MΩ/m at 108.5 MHz. By using a proper design of drifttubes and stabilizing rods to fix the support stems, they obtained a nearly constant axial field distribution. The resonator will be used for postacceleration of CO^+ molecules—which are preaccelerated to 153 keV/N by a CN Van de Graaff—up to 224 keV/N requiring less than 15 kW RF power, corresponding to a total cavity voltage of 3 MV and a resonator length of about 1 m. (14 refs.)

99795 Voltage breakdown in S-band linear accelerator cavities. E.Tanabe (Radiation Div., Varian Associates Inc., Palo Alto, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3551-3 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Voltage breakdown is one of the major limiting factors in the design of a high accelerating gradient linear accelerator structure. A multiple-use cavity test system was developed to establish the criteria for voltage breakdown in S-band pulsed electron linear accelerator cavities, in terms of cavity geometry, accelerating gradient, RF pulse shape and repetition rate, surface finish, temperature and external magnetic field. The experimental set-up and test procedure, as well as the experimental results, are presented. (3 refs.)

99796 Radio-frequency quadrupole vane-tip geometries. K.R.Crandall, R.S.Mills, T.P.Wangler (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3554-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Radio-frequency quadrupole (RFQ) linacs are becoming widely accepted in the accelerator community. They have the remarkable capability of simultaneously bunching low-energy ion beams and accelerating them to energies at which conventional accelerators can be used, accomplishing this with high-transmission efficiencies and low-emittance growths. The electric fields, used for radial focusing, bunching, and accelerating, are determined by the geometry of the vane tips. The authors review the vane-tip geometry based on the 'ideal' two-term potential function and briefly describe a method for calculating the electric field components in an RFQ cell with arbitrary vane-tip geometry. They describe five basic geometries and use the prototype RFQ design for the Fusion Materials Irradiation Test (FMIT) accelerator as an example to compare the characteristics of the various geometries. (5 refs.)

99797 100% duty factor RFQ linac systems at CRNL. R.M.Hutcheon, J.C.Brown, L.D.Hansborough, S.O.Schriber, R.B.Turner (Chalk River Nuclear Labs., AECL, Chalk River, Ontario, Canada).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3557-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
An RFQ linac operating at 100% duty factor (CW) and high currents is required for an accelerator breeder. Two high power structures are being built as part of the RFQ development program. First, a copper 270 MHz sparker cavity with RFQ geometry is being tested to determine CW field breakdown levels and conditioning characteristics. The design and status of the 'sparker' are presented. Secondly, a 270 MHz CW RFQ linac (RFQ1) is being designed to accelerate a nominal 75 mA from 50 to 600 keV, to study beam quality and stability as well as resonator field tuning and leveling requirements under conditions of high beam loss at high average power. The combination of CW operation and restricted space at the entrance require new approaches in end terminations and tuners. The status of RFQ1 is presented and design innovations outlined. (7 refs.)

99798 Design of RFQ vane tip to minimize sparking problems. B.G.Chidley, G.E.McMicheal, G.E.Lee-Whiting (Chalk River Nuclear Labs., Chalk River, Ontario, Canada).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3560-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Transverse and longitudinal focusing in radio-frequency quadrupole (RFQ) accelerators depends on V/R_0 (the vane voltage divided by the mean radial aperture). For maximum current carrying capacity, one generally designs for maximum V/R_0, which is limited by the peak surface electric field E_S $(=\kappa(V/R_0))$ that can be sustained without sparking. The value of the enhancement factor κ depends on the pole geometry and can be minimized by choosing an appropriate pole shape. A computer program POTRFQ will be described which derives the field potential $\phi(r,\theta,z)$ and the vane tip contour, for a range of input parameters. The effects on the beam dynamics of the higher multipole components resulting from the modified pole shapes will also be presented. (2 refs.)

99799 Study of peak power doublers with spherical resonators. A.Fiebig, R.Hohbach (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3563-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Based on the work done at SLAC by Z.D. Farkas et al. (1974) SLED, it was investigated whether a similar arrangement can be used for the LEP Injector Linac (LIL) in order to save high power klystrons by feeding, for a part of the accelerator, twice the number of accelerating sections from one klystron (LIPS=LEP Injector Power Saver). It seemed interesting to make use of the high quality factor of spherical resonators ($2...2.5\times10^5$) as compared to 10^5 of the cylindrical resonators used for SLED. The advantages (high Q) and

disadvantages of spherical resonators (high number of competing resonant modes, problems of orientation, coupling) are discussed. Results of measurements with low power (c.w. and pulses) on single resonators and a complete model, and with high power on a prototype are presented. (4 refs.)

99800 The launching of a 3-MeV proton RFQ linac. I.M.Kapchinskij, V.A.Andreev, V.S.Artemov, V.I.Bobylev, I.V.Chuvilo, E.N.Daniltsev, V.I.Edemskij, L.V.Kartsev, A.M.Kozodaev, A.A.Kolomiets, V.S.Kosiak, R.P.Kuibida, V.V.Kushin, N.V.Lazarev, Ju.B.Stasevitch, S.B.Ugarov, R.M.Vengrov (Inst. for Theoretical & Experimental Phys., Moscow, USSR).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3579-81 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A 3 MeV RFQ linac has been constructed in the ITEP. Values of the linac design parameters attained in practice as well as some preliminary experimental results obtained at the machine launching with output current rising up to 100 mA are reported. (22 refs.)

99801 Operating characteristics of a 2.0-MeV RFQ. F.O.Purser, E.A.Wadlinger, O.R.Sander, J.M.Potter, K.R.Crandall (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3582-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A second radio-frequency quadrupole (RFQ) accelerator has been designed, constructed and operated at Los Alamos National Laboratory. The accelerator's design parameters represent a major extension from the original Los Alamos RFQ, with the new accelerator being 2.5 times as long, having three times the output energy, and with 2.5 times the current limit. The new accelerator's operating characteristics were studied for 3 months before disassembly to incorporate design modifications. Results are discussed. (6 refs.)

99802 Mechanical features of the ATS RFQ linear accelerator. N.G.Wilson, T.D.Hayward, G.W.Lind (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3585-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A radio-frequency quadrupole (RFQ) linear accelerator has been constructed and placed in operation on the accelerator test stand (ATS). This accelerator uses an evacuated RF manifold to distribute RF excitation from the 425-MHz RF power supply to the slot-coupled, RFQ vane-cavity, resonator assembly. Measurements made on the accelerator as assembled have demonstrated >8000 vane-cavity Q at the quadrupole's ~423.400-MHz accelerating-mode frequency. Operating manifold vacuum of 3-6×10^{-8} torr has been observed after RF conditioning; conditioning required 150 h for stable high-power RF operation. Experience to date has indicated the desirability of modifying the vane RF-contact seat configuration to improve assembly and alignment procedures, improving vane-machining processes to increase vane straightness, installing periodic vane-shorting rings to minimize the effect of dipole modes in the quadrupole accelerating structure, and modifying the waveguide-coupling slot in the manifold to improve forward RF power flow. (2 refs.)

99803 Higher modes in the coupling cells of coaxial and annular-ring coupled linac structures. R.A.Hoffswell, R.M.Laszewski (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3588-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Dipole- and quadrupole-like modes in the coupling cells of coaxial and annular-ring coupled structures have been examined up to a frequency of 4 GHz. The quadrupole mode frequencies appear to lie high enough above the frequency of the accelerating mode to make coupling between the two unlikely. In the annular-ring case, however, a dipole mode was found very near the accelerating mode frequency. Evidence is presented which suggests that some power may couple between these two modes in a real cavity. (4 refs.)

99804 Heat transfer, thermal stress analysis and the dynamic behaviour of high power RF structures. J.McKeown, J.-P.Labrie (Chalk River Nuclear Labs., AECL, Chalk River, Ontario, Canada).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3593-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A general purpose finite element computer code called MARC is used to calculate the temperature distribution and dimensional changes in linear accelerator RF structures. Both steady state and transient behaviour are examined with the computer model. Combining results from MARC with the cavity evaluation computer code SUPERFISH, the static and dynamic behaviour of a structure under power is investigated. Structure cooling is studied to minimize loss in shunt impedance and frequency shifts during high power operation. Results are compared with an experimental test carried out on a CW 805 MHz on-axis coupled structure at an energy gradient of 1.8 MeV/m. The model has also been used to compare the performance of on-axis and coaxial structures and has guided the mechanical design of structures suitable for average gradients in excess of 2.0 MeV/m at 2.45 GHz. (11 refs.)

99805 The 500-MeV, $2^1/_2$% duty factor linear electron accelerator (MEA). P.J.T.Bruinsma, F.B.Kroes, L.H.Kuijer, J.G.Noomen, J.B.Spelt, A.G.C.Vogel (Nat. Inst. for Nuclear & High-Energy Phys., Amsterdam, Netherlands).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3599-601 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Although the intermediate energy electron accelerator in Amsterdam has not reached completely its design specifications, since early 1981 a fully grown scientific program has developed using beams with an energy ranging from 20 to 120 meV in the 140 MeV substation and from 70 to 400 MeV in the high energy stations for electron scattering and physics with pion and muon beams. A brief description of the MIT-type accelerator and its performance is given with emphasis on typical features of the machine. Some examples are given of recently obtained scientific data from which it can be derived that the quality of the beam is in full accordance with the high performance level of the scientific equipment, involving a complex beam transport system and a pair of spectrometers for high resolution (1×10^{-4}) work. (6 refs.)

99806 Assembly and installation of the 2-MeV FMIT accelerator. D.Liska, R.Michelotti (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3620-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The front end of the 35-MeV Fusion Materials Irradiation Test (FMIT) Facility accelerator is being assembled and installed at Los Alamos. The machine ultimately will produce a 500-kW continuous duty beam at 5 MeV, although only the first 2-MeV will be installed this year. The 2-MeV system will include the most powerful radio frequency quadrupole (RFQ) in existence. The assembly and installation of the hardware are described, along with the unique problems arising from the large size and high power of the components involved. (no refs.)

99807 Long-pulse induction acceleration of heavy ions. A.Faltens, M.Firth, D.Keefe, S.S.Rosenblum (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3669-71 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A long-pulse induction acceleration unit has been installed in the high-current Cs^+ beam line at LBL and has accelerated heavy ions. A maximum energy gain of 250 keV for 1.5 μS is possible. The unit comprises 12 independent modules which may be used to synthesize a variety of waveforms by varying the triggering times of the low voltage trigger generators. (6 refs.)

99808 A high-energy, laser accelerator for electrons using the inverse Cherenkov effect. J.R.Fontana (Electrical & Computer Engng. Dept., Univ. of California, Santa Barbara, CA, USA), R.H.Pantell.
J. Appl. Phys. (USA), vol.54, no.8, p.4285-8 (Aug. 1983).
A laser method for accelerating electrons is described, based on the inverse Cherenkov effect in a gas. The laser fields are in the form of a cylindrical cone of plane waves on whose axis travel the electrons, with the cone angle and the gas refraction index such that each electron sees constant fields in time. Expressions are obtained relating the overall energy transfer to total laser power and wavelength, and to gas index and interaction length. With laser powers now available, energy increments of tens of GeV are possible. For comparative purposes, a related alternative scheme involving electrons in vacuum and evanescent fields is also analyzed. It is found that the method applies particularly well to adding energy to the electron bunches produced by large microwave accelerators, as collision effects are less troublesome at high injection energies. (14 refs.)

99809 Design, fabrication and performance of the dipole and quadrupole magnets for the RIKEN heavy-ion linear accelerator. M.Hemmi, Y.Miyazawa, T.Inoue, M.Odera.
Rep. Inst. Phys. & Chem. Res. (Japan), vol.59, no.3, p.79-111 (1983). In Japanese.
The RIKEN heavy-ion linear accelerator (RILAC) consists of a 500 kV injector and six Wideroe type high frequency accelerating structures. It can accelerate wide range of heavy-ions having different mass to charge ratios by use of variable frequency scheme. In order to focus and guide those heavy-ions, the magnet system must satisfy several requirements. The maximum magnetic rigidity of the ions is 500 kG.cm in the beam line between the injector and the first resonator and 3000 kG.cm after acceleration by the six cavities. The authors give descriptions of the design, technology of fabrication and specifications of the dipoles and quadrupoles of the magnet system with many relevant figures and drawings. (4 refs.)

9.20 CYCLIC ACCELERATORS AND STORAGE ACILITIES

or plasma accelerators, see 52.75)

9810 The CERN PS complex as an antiproton source.
EE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2039-41 (Aug. 1983). 983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
ur years after the start of the pp̄ project, the PS-complex has become an fective p̄ source. The process of p̄ accumulation and transfer is recalled and e 'modes' in which the machines operate are described. The performance hieved has permitted extended physics runs in which considerable operanal experience has been gained. (10 refs.)

9811 Antiprotons in the ISR. P.J.Bryant (LEP Div., CERN, Geneva, vitzerland).
EE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2047-9 (Aug. 1983). 983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
brief account is given of the events leading up to antiprotons in the Intercting Storage Rings (ISR) followed by a synopsis of the characteristics and rameters of the physics runs made to date. Experience gained with critical erations, such as transfer line steering, injection optimization, stacking and ase displacement acceleration is reviewed. Special reference is made to the rious machine improvements, namely the vertical transverse stochastic coolg for proton beams of up to 12 A, the transverse and longitudinal stochastic oling for the antiprotons, the new antiproton beam position monitoring stem in the transfer lines and ring and the use of two high-luminosity sertions. (16 refs.)

9812 Research efforts on increase of IHEP proton synchrotron intensity. u.M.Ado, E.A.Myae, A.A.Naumov, V.A.Teplyakov, E.F.Troyanov.
EE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2053-5 (Aug. 1983). 983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
e intensity of 5.6×10^{12} ppp attained at the IHEP accelerator with proton jection energy of 100 MeV is close to the incoherent Coulomb limit. The nstruction of a new 1.5 GeV injection system (fast cycling booster) to crease the accelerated beam intensity is near completion. A number of the ain ring systems have been modified with the goal to get ready for the oster operation. (9 refs.)

99813 The IUCF cooler—a storage ring with electron cooling for internal target experiments. R.E.Pollock (Dept. of Phys., Indiana Univ., Bloomington, IN, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2056-60 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A project to construct a ring to store beams of light ions with magnetic rigidities up to 3.6 T-m is under way at the Indiana University Cyclotron Facility. Beams from the cyclotron will fill the ring, be adjusted in energy, then cooled by electron immersion while impinging on thin targets within the ring for nuclear interaction experiments. The motivation is to explore the potential for improved resolution and reduced background of the cold storage technique. The status of the project and of selected subsystem designs is presented. (11 refs.)

99814 Initial operation of the MSU superconducting cyclotron. M.L.Mallory (Cyclotron Lab., Michigan State Univ., East Lansing, MI, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2061-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
On August 31, 1982, the first beam was extracted from the Michigan State University superconducting K500 cyclotron. Shortly thereafter the first experiment was performed with a 35 MeV/n carbon beam. The known operating characteristics of the K500 cyclotron are reported. Some of the technological innovations of the machine are described. Progress on the next phase of the project, the K800, is discussed. (8 refs.)

99815 A 100-MeV injector race-track microtron for the MAX storage-ring/pulse-stretcher. M.Eriksson (Max-Lab, Univ. of Lund, Lund, Sweden).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2070-1 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A 100 MeV pulsed race-track microtron (RTM) has been in operation at the University of Lund since 1979. The RTM will now be used as an injector for a storage-ring/pulse-stretcher currently being built. The RTM with its injection, acceleration and extraction systems are described and the beam characteristics are discussed. (6 refs.)

99816 A low cost heavy ion accelerator for 10 to 40 MeV/a. M.Lieuvin (Inst. des Sci. Nucleaires, Grenoble, France).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2072-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
SARA 'Systeme Accelerateur Rhone-Alpes' is a two stage accelerator now running at the Grenoble Institut des Sciences Nucleaires (ISN). It is a heavy ion accelerator giving beams from Li to Ar at a maximum energy of 40 MeV/amu. (4 refs.)

99817 Coupled operation experience at the Holifield heavy ion research facility. R.S.Lord, J.B.Ball, E.D.Hudson, P.K.Kloeppel, C.A.Ludemann, J.A.Martin, S.W.Mosko, N.F.Ziegler (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2077-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The 25 URC Pelletron tandem/electrostatic accelerator and the Oak Ridge Isochronous Cyclotron (ORIC) comprise the accelerators of the Holifield Heavy Ion Research Facility (HHIRF). The two machines may be operated individually or coupled, with ORIC serving as an energy booster for the tandem. In the coupled mode, the ion beam enters the cyclotron through the dee stem and is directed by the inflection magnet so that it is tangent to an orbit suitable for acceleration at a higher charge state. A thin carbon foil, placed at the point of tangency, strips the ions so that a substantial fraction are in the desired higher charge state. This fraction of the beam is then accelerated and extracted in the normal fashion. Full energy performance (25 MeV/A oxygen) was demonstrated during first coupled-operation in January 1981. Routine coupled operation for experiments commenced in July 1982. (8 refs.)

99818 Beam stacking experiments at TARN. T.Katayama, K.Chida, T.Hattori, S.Kadota, A.Mizobuchi, T.Murakami, T.Nakanishi, A.Noda, M.Takanaka, N.Tokuda, S.Yamada, Y.Yonehara, M.Yoshizawa, S.Watanabe, Y.Hirao (Inst. for Nuclear Study, Univ. of Tokyo, Tokyo, Japan).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2080-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
TARN is a low energy ion storage ring aimed at the beam accumulation both in the longitudinal and transverse phase spaces from the injector cyclotron. Up to now, proton, H_2^+, α and $^3He^+$ beams have been stored and the close agreements are shown between the theoretical and experimental results on the beam dynamics. Twenty turn beam are injected in the betatron phase space area of 87 πmm.mrad by the multiturn injection method and 15 pulses are RF stacked in the momentum space $\Delta p/p$ of 2.2%. Overall stacking number is then attained at around 300 turns. RF stacking is performed with the repetition rate of 30 Hz and it requires ~0.5 second to fill the whole phase spaces with beam. The e-folding life time of 7 MeV proton is 400 s at the vacuum pressure of 1×10^{-10} Torr, whereas that of $^3He^+$ is 60 ms at 1×10^{-8} Torr of ^4He target. Collision strengths of charge exchange atomic reaction have been measured. (9 refs.)

99819 ASTOR, concept of a combined acceleration and storage ring for the production of intense pulsed or continuous beams of neutrinos, pions, muons, kaons and neutrons. W.Joho (Swiss Inst. for Nuclear Res., Villigen, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2083-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A new concept for a high intensity accelerator for 2 GeV protons using the continuous 590 MeV beam from the present ring cyclotron has been worked out at SIN. To suppress the cosmic background in neutrino experiments are pulsed beam with high peak current and low duty cycle is required. Using the so called phase expansion effect, the acceleration and storage effect are combined in a single isochronous cyclotron ASTOR. With the help of several RF cavities, positioned at different radii it is possible to operate ASTOR either in a pulsed mode at 1500 Hz or in a continuous mode. The anticipated beam powers are 0.8 MW and 4 MW respectively. The ASTOR concept is also applicable in a possible kaon factory design, acting as an interface between the SIN ring cyclotron and a 50 Hz synchrotron for 15 to 20 GeV protons. (9 refs.)

99820 The proposed university of Manitoba polarised and unpolarised light ion facility. S.Oh, F.Konopasek, V.Derenchuk, I.Gusdal, A.McIlwain, R.Pogson, J.S.C.McKee (Cyclotron Lab., Univ. of Manitoba, Winipeg, Manitoba, Canada).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2089-91 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A variable energy cyclotron with six separated sectors is proposed for the acceleration of polarised and unpolarised light positive (p,d, $^{3}He^{++}$, ^{4}He, $^{6}Li^{+++}$, $^{7}Li^{+++}$ etc.) and light negative (H^- and D^-) charge state ions. H^- and D^- beams can be accelerated and extracted by stripping foils and in this case the lower limit of the energy range will be reduced, (to 10 MeV for H^-). Cost consideration is a very important factor. Because of this, it is proposed to inject the beam from an external ion source at low energy (~200 keV), rather than incorporate a pre-accelerator. The acceleration of H^- and D^- particle entails losses through collisional electron detachment and electromagnetic stripping inside the cyclotron. The loss from the former is expected to be ~10% for D^- (at 10^{-7} Torr) while the loss from the latter is estimated to be ~0.04% for H^-. (4 refs.)

99821 Progress towards higher intensities and improved beam stability at TRIUMF. P.W.Schmor, R.Baartman, J.W.Carey, D.Dohan, G.Dutto, G.H.Mackenzie (TRIUMF, Vancouver, BC, Canada).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2092-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The TRIUMF accelerator routinely delivers up to 120 μA of 500 MeV protons. For tests, 150 μA have been extracted in a CW mode, 225 μA equivalent in a 10% duty-cycle pulsed mode. Longitudinal space-charge effects are observed at these higher currents. A lead target, used as a beam dump and thermal neutron source, is being upgraded to allow extracted currents up to 375 μA CW. The reliability and performance of the cyclotron has significantly increased as the result of several recent developments. Improvements to the main magnet power supply (18000 A) have resulted in a magnetic field stability better than ±0.8 ppm for periods of 2 h. The effect on beam phase, instability and separated turn operation is presented. A Lamb-shift polarized H^- source provides up to 300 nA extracted. An ECR proton source has been tested as a replacement for the duoplasmatron on the polarized source. A gain in current of order 5 is expected. To satisfy the long-term needs, work has begun on developing an intense optically pumped, polarized source with the aim of increasing the current by a factor of 100. (8 refs.)

99822 Status report on GANIL.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2102-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The first beam (Ar^{+4}) from SSCl was obtained in June 82. A full energy Ar^{+16} beam at ~44 MeV/A was accelerated in SSC2 in November and delivered to physicists in January 83. Till now, nine experiments have been performed. (6 refs.)

99823 Modifications to the injection system of the K800 superconducting cyclotron. F.Marti, D.Johnson, H.G.Blosser, B.Milton (Cyclotron Lab., Michigan State Univ., East Lansing, MI, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2105-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The original design of the K800 cyclotron called for a pole tip geometry with a double spiral. After studying the feasibility of designing a stripping mechanism that would fit inside one of the dees, it was decided to use the simpler single spiral pole tips. In this paper the authors describe the calculations made to study the injection orbits. (2 refs.)

99824 Design status of the Munich cyclotron SuSe. U.Trinks, H.Daniel, G.Graw, G.Hinderer, E.Huenges, P.Kienle, H.J.Korner, H.Morinaga, F.Nolden, E.Nolte, H.J.Scheerer, U.Schneider, W.Schott, S.Skorka, W.Wilhelm, H.G.Willers, E.Zech (Phys. Dept., Tech. Univ. Munchen, Garching, Germany).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2108-10 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
At the Munich Accelerator Laboratory the design study for the superconducting sector cyclotron SuSe with the existing 13 MV-tandem as injector is in a final state. SuSe will accelerate protons and heavy ions to maximum energies of 500 MeV respectively 300 MeV/u (for Q/A=0.5) with excellent beam properties. Some new technical developments were needed. A prototype of a superconducting sector coil is under test. Several models for the RF-cavities were built. At present a 1:1 prototype power model is under construction. A superconducting channelmagnet without stray fields for injection is developed. (6 refs.)

99825 Injection from the K500 superconducting cyclotron into the 88″ cyclotron at Texas A&M. B.Laune, D.P.May, R.C.Rogers, W.C.Chapman, W.J.Walterscheid, G.Derrig, Y.L.Tsien, P.Smelser, D.H.Youngblood (Cyclotron Inst., Texas A&M Univ., College Station, TX, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2111-13 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The construction of a superconducting cyclotron of the MSU design (K=500, K_f=160) is under way at Texas A&M. It will be used both alone and as an injector for the existing 88″ (K147) cyclotron. A beam optics study has been carried out for injection of K550 cyclotron heavy-ion beams into the K147 cyclotron. This study traces a variety of beams from extraction at the K500 cyclotron until focused and dispersion matched into the proper orbit of the K147 cyclotron. The line is configured to decouple the parameters of each cyclotron by first bringing the momentum dispersion to zero and then producing a double waist which serves as the apparent source for the second cyclotron. Beam line optics for standalone operation of the K500 cyclotron, which provides for use of the present experimental facilities, have also been studied. Construction of the K500 cyclotron is proceeding approximately on schedule with operation expected in 1985. (8 refs.)

99826 Preliminary design of the NRL modified betatron. J.Golden, J.Pasour, D.E.Pershing, K.Smith, F.Mako, S.Slinker, F.Mora, N.Orrick, R.Altes, A.Fliflet, P.Champney, C.A.Kapetanakos (Naval Res. Lab., Washington, DC, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2114-16 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The principal subsystems of the NRL Modified betatron accelerator (MBA) have been designed. These subsystems include the air-core magnets, the mechanical structure, the vacuum system, the injector accelerator, and the pulse power capacitor banks. The MBA concept uses an applied toroidal magnetic field B_θ (2-5 kG) to improve the stability and confinement of a multikiloamp e-beam. Trapping of an injected beam will results from varying the B_z by a few Gauss during the first poloidal bounce period. Externally driven coils will compensate the diffusion of the self magnetic field to maintain equilibrium. (9 refs.)

99827 Conceptual design of a 1.1-GeV 500-μA fast cycling proton synchrotron. Y.Cho, E.Crosbie, T.Khoe, R.Kustom, R.Martin, J.Norem, W.Praeg, K.Thompson, G.Wustefeld (Argonne Nat. Lab., Argonne, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2117-19 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A very high intensity proton synchrotron system which could be used for a pulsed spallation neutron source and low energy neutrino and meson physics facility is designed. The synchrotron would accelerate 200 MeV protons to 1.1 GeV with a repetition rate of 50 pulses per sec. The number of protons per pulse is 6.3×10^{13}, resulting in an average proton current of 500 μA. Special features of the conceptual design include H^- charge exchange injection, a guide field flat-bottom of 1.5 msec to facilitate low-loss injection and capture, 15 msec acceleration period, and 3.5 msec for reset of the guide field. A separated function lattice consists of normal cells, dispersion suppressor cells, and matching cells. It provides sufficient straight section length to accommodate a fairly long RF system. A low impedance RF system (cathode-follower) is considered in order to overcome strong beam loading effects in the cavities. Rapid bunch shaping is employed at the end of acceleration to produce pulses of 200 nsec duration for possible neutrino experiments. The transverse acceptances used in the design are: $\epsilon_H=500\ \pi$ mm mr and $\epsilon_V=300\ \pi$ mm mr. (7 refs.)

99828 A variable transition energy lattice for SIS 12/18. B.Franczak, K.Blasche (GSI, Darmstadt, Germany), K.H.Reich.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2120-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
GSI plans to build a heavy ion synchrotron, SIS 12/18, as an extension to its UNILAC facility. This linear accelerator, in operation since 1976, accelerates heavy ions up to 20 MeV/u. SIS 12/18 will extend this range up to 1 GeV/u for the heaviest ions like uranium ($q/A\approx0.3$), and even up to 2 GeV/u for light ions with a specific charge $q/A=0.5$. Acceleration of intense proton beams to 4.5 GeV ($\gamma=5.8$) is being discussed as an option, for instance to produce exotic radionuclides, or for experiments comparing proton interactions with those of ions. In normal operation of magnetic rigidity of 12 Tm can be reached in a fast cycle (dB/dt=10 T/s, 3 cycle/s). For high energy operation up to 18 Tm, the power supplies are connected for giving a peak current of 3500 A at a reduced cycle rate (dB/dt=4 T/s, 1 cycle/s). (5 refs.)

99829 Measuring and manipulating an accumulated stack of antiprotons in the CERN antiproton accumulator. R.Johnson, S.van der Meer, F.Pedersen (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2123-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The antiproton stack is observed through Schottky scans, both longitudinal and transverse. A particular feature is the wide dynamic range needed for observing both the dense core and the freshly-deposited tail. Separating batches of antiprotons from the stack is a highly automated process including the measurement of the momentum distribution and the generation of a suitable RF function to remove a slice of the desired density. Multiple slices may be removed successively and a process for locally flattening the distribution to obtain equal batch intensities is used. When successive batches are unstacked and ejected, the process may have to be aborted if the particles do not arrive correctly at the user. A 'restack' facility is provided to return any antiprotons to the stack that have been unstacked but not ejected. A missing-bucket scheme for unstacking low-intensity batches for LEAR is also described. (2 refs.)

99830 Status of the Milan superconducting cyclotron project. E.Acerbi, F.Aghion, F.Alessandria, G.Baccaglioni, G.Bellomo, C.Birattari, J.Camon, C.De Martinis, E.Fabrici, D.Giove, W.Giussani, G.Gualeni, P.Michelato, L.Milinkovic, C.Pagani, E.Panzeri, F.Resmini, L.Rossi, A.Salomone, L.Serafini, G.Varisco, V.Venturini (Univ. of Milan, Milan, Italy).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2126-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Presents an updated status report on the superconducting cyclotron, under construction at the University of Milan during the past two years. The cyclotron is designed for a K=800 and a K_{FOC}=200, thus yielding maximum energies of 100 MeV/n for fully stripped light ions and 20 MeV/n for uranium ions. The pole radius is 90 cm with three sectors having an average spiral constant of 1/45.7 rad/cm. The average magnetic field will span between 22 and 48 kgauss, with a corresponding RF frequency range between 15 and 48 MHz. The anticipated peak dee voltage is 100 kV, with harmonic operation from h=1 to h=4. The operating modes of the machine include: (i) use of an internal PIG source; (ii) injection from a 16 MV Tandem; (iii) axial injection from an external ion source. (8 refs.)

99831 Lattice for a 1.1-GeV 500-μA fast cycling proton synchrotron. Y.Cho (Argonne Nat. Lab., Argonne, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2129-30 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A very high intensity proton synchrotron lattice has been designed for a spallation neutron source system. The synchrotron is to accelerate a beam of 6.25×10^{13} protons from 200 MeV to 1100 MeV in 15 msec. The proposed lattice is in modular form of storage ring type consisting of normal cells, dispersion suppressor cells and matching and straight section cells. Due to the fast repetition rate, the maximum required energy gains per turn is approximately 100 KeV, and this in turn needs approximately 20 meters or more of straight sections for the acceleration cavities. The lattice proposed consists of four sectors, and each sector is made up by thre e FODO normal cells, four dispersion suppressor cells, and four matching and straight section cells. Then the total of 44 cells with approximately 90°/cell phase advance would make the natural tune of the machine to near 11. However, a working point consideration prefers $\nu_x=10.3$ and $\nu_y=11.3$. (1 ref.)

99832 The JINR phasotron: status and progress. V.P.Dzhelepov, V.P.Dmitrievsky, L.M.Onishchenko (Joint Inst. for Nuclear Res., Dubna, USSR).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2134-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The synchrocyclotron of the Laboratory of Nuclear Problems (JINR) for 680 MeV protons has been operational for 30 years. Since 1979 it has been under conversion. The conversion is aimed at making a phasotron with spatial variation of the magnetic field using the building and the magnetic core of the former accelerator. According to the conversion plan the whole accelerator equipment, including the electromagnetic windings, pole tips, the accelerator

chamber, the dee with the resonance line, rotating capacitor, RF generator, ion source, beam extraction system and auxiliary equipment will be replaced. Up to date all the accelerator units have been assembled; the magnetic field which ensures the proton acceleration up to the extraction radius has been formed; the vacuum system has been adjusted and high vacuum is achieved in the accelerator chamber. (no refs.)

99833 The control system for LEP. M.C.Crowley-Milling (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2142-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
There are three main ways in which the requirements for the LEP control system differ from systems that have been built in the past. These are the great distances involved with a ring 27 km in circumference, the introduction of microprocessors into the equipment itself and the long timescale at a time when progress in electronics is rapid, with the cost of hardware falling every year, without any corresponding fall in the cost of specialized software. In view of the latter, there are many detailed decisions that cannot be taken at the moment, but the basic principles have been laid down, and a number of developments and investigations have been started. The paper firstly discusses the effects of the introduction of microprocessors, followed by the basic principles of the LEP control system and a description of the work in progress. (11 refs.)

99834 A broadband accelerator control network. J.Skelly, T.Clifford, R.Frankel (Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2155-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A broadband data communications network has been implemented at BNL for control of the alternating gradient synchrotron (AGS) proton accelerator, using commercial CATV hardware, dual coaxial cables as the communications medium, and spanning 2.0 km. A 4 MHz bandwidth digital control channel using CSMA-CA protocol is provided for digital data transmission, with 8 access nodes available over the length of the RELWAY. Each node consists of an RF modem and a microprocessor-based store-and-forward message handler which interfaces the RELWAY to a branch line implemented in GPIB. A gateway to the RELWAY control channel for the (preexisting) AGS computerized accelerator operating system has been constructed using an LSI-11/23 microprocessor as a device in a GPIB branch line. A multilayer communications protocol has been defined for the digital control channel, based on the ISO Open Systems Interconnect layered model, and a RELWAY Device Language defined as the required universal language for device control on this channel. (2 refs.)

99835 Properties and possible use of beam-beam synchrotron radiation. M.Bassetti, J.Bosser, M.Gygi-Hanney, A.Hofmann, E.Keil (CERN, Geneva, Switzerland), R.Coisson.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2182-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
In large electron-positron colliding beam facilities the fields created by one beam in the crossing point are quite large and cause the particles in the other beam to radiate synchrotron radiation. The total power emitted in the form of this beam-beam synchrotron radiation is calculated for beams with a bi-Gaussian cross-section colliding head-on, and its dependence on beam separation is estimated. The radiation emitted in the forward direction is quite hard and has a complicated spectrum. However the radiation emitted at angles much larger than both $1/\gamma$ and the deflecting angle, is softer and has the properties of 'short magnet' radiation. Its spectrum observed at a fixed angle is directly given by the Fourier transform of the longitudinal dependence of the deflection field. The polarization has a simple azimuthal dependence. This radiation can be used for beam diagnostics. (17 refs.)

99836 The control system for the dedicated synchrotron radiation storage ring BESSY. G.von Egan-Krieger, W.-D.Klotz, R.Maier (Berliner Elektronenspeicherring GmbH, Berlin, Germany).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2273-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
BESSY is a 800 MeV electron-storage ring dedicated to research with synchrotron radiation in the VUV and soft X-ray region. The storage ring is fed by a 800 MeV separated function synchrotron with a classical 20 MeV microtron as preinjector. The machines are remotely controlled by four minicomputers which are linked by a local network. The computers are connected to a commercially available electronic interface system. (3 refs.)

99837 A multiprocessor bus architecture for the LEP control system. J.Altaber, R.Rausch (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2281-3 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The architecture and the system aspects of the multimaster bus used for the construction of the process computer assemblies and the message handling assemblies of the LEP control system are presented. This bus architecture provides a fully distributed reservation mechanism and a protected access of the peripherals to prevent processor interferences. To achieve this, a channel concept is proposed, using a system bus for communication between processors and with their peripherals. The architecture is microprocessor independent, provides dynamic bus allocation amongst several microcomputers, offers processor position independence and has a multimaster bus extension to several crates with a homogeneous addressing. A global system concept, called E3S, has been developed including the definition of software primitives. The bus access software is organised in a layered structure matching the module functionality. (7 refs.)

99838 New methods to correct on-line the closed orbit of a synchrotron accelerator with variable focusing configuration. L.Burnod, E.D'Amico (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2284-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A high energy proton synchrotron, operating as an accelerator for fixed target physics has often a very simple and periodic structure at least at the design stage. For instance the CERN SPS working in this mode has 108 identical FODO sections. For a given plane, horizontal or vertical, beam position detectors (BP), all identical, and closed orbit correction dipoles (COD), also identical, can be located near the quadrupoles where the betatronic amplitude (β) and the phase advance (μ) are constant from one element to the next. The closed orbit correction (only needed at low energy) is then straightforward using the simple beam bump method on three adjacent CODs. Transforming such an accelerator into a proton-antiproton (pp) collider significantly alters its periodicity. To increase the luminosity, low beta configurations are inserted at the crossing points, changing β and μ around the ring and modifying the physical layout of BP and COD. New types of BP are required locally to detect p and p and well as new types of COD to correct the closed orbit at any energy inside the insertions. Furthermore the working points and the low beta configurations can change from one experiment to the other. (4 refs.)

99839 Replacing mini-computers by multi-microprocessors for the LEP control system. J.Altaber, M.C.Crowley-Milling, P.G.Innocenti, R.Rausch (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2287-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The control system for the CERN SPS machine has pioneered a control strategy which has expanded the usual central control methodology not only spatially among computers but also organisationally among people. Each fragment resulting from this 'controlled explosion' is a mini-computer containing a message exchange package which loosely couples the fragments, a multitasking monitor and an interpreter. A small number of professional programmers have constructed a system which numerous engineers and technicians have been employing both for the day-to-day operation of the machine and for developing experimental multi-computer control procedures. The same strategy will be used for the LEP machine but a further expansion will be implemented breaking down the mini-computer, basic construction block of the SPS control system, into clusters of loosely coupled micro-computer based units. Apart from the availability of the technology, this expansion is feasible because of the underlying constructional principles of the SPS system which will be transported intact to the LEP system. The paper will describe the problem of organising the clusters analogue to a mini-computer running tasks interacting with real-time events; it will be shown that simple hardware and software solutions exist for the problems that arise, and in addition it is possible to organize a uniform data flow through the system. (6 refs.)

99840 Computer control of RF-manipulations in the CERN Antiproton Accumulator. R.Johnson, S.van der Meer, F.Pedersen, G.Shering (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2290-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The Antiproton Accumulator uses a conventional RF system for bunched beam manipulations within the ring. These require precise control of the bucket size, the synchronous phase angle, and the radial position across the width of the vacuum chamber, over which the magnetic properties of the ring vary significantly. Several different manipulations are required, often in close succession, so a fast, reliable, and accurate method of switching between them is required. This has led to an unconventional, computerised, beam control system. For a desired set of beam manipulations, the computer calculates the needed voltage and frequency as functions of time, using a mathematical model of the beam and lattice. These are then loaded into function generators which subsequently operate independently of the computer. (5 refs.)

99841 The CERN SPS low beta insertion control system. H.K.Kuhn, A.Hilaire (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2293-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Within the context of the CERN SPS p$\bar{p}$ colliding beam experiments there are 2×15 power supplies which have to provide the currents necessary to produce the two low beta insertions. Their control system is described for both the hardware and the software parts. The references use a combination of an 18 bit DAC and an integrator to produce a relatively smooth drive signal to the current controlled power supplies. (no refs.)

99842 Accelerator controls at DESY. (Machine Control Group, DESY, Hamburg, Germany).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2299-301 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Six e^+e^- accelerators are working at DESY. All of them are operated from one central control room via the new common control system. The report describes some design aspects, system structure, first experience, and the control room. (4 refs.)

99843 The Proton Storage Ring control system. P.Clout, S.Bair, A.Conley, R.Ford, M.Fuka, N.Greene (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2305-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
When designing a control system for a new facility, one is faced with a bewildering array of electronic devices to use in the solution. There is, of course, no single correct solution because the constraints are laboratory and project dependent. The major constraint applicable to the hardware choice for the Proton Storage Ring (PSR) control system was the limited manpower available for the design, development, and documentation of custom hardware. As a result, wherever possible, commercial components have been used that are based on recognized standards. The array of choice on the hardware side contrasts markedly with the absence of suitable commercial software products, and it is unfortunate that here there seems to be little prospect of change. The analysis of the overall system that follows leads to a suitable hardware choice and a description of the software's structure. (4 refs.)

99844 A high performance control system for a heavy ion medical accelerator. H.D.Lancaster, S.B.Magyary, R.C.Sah (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2311-13 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A high performance control system is being designed as part of a heavy ion medical accelerator. The accelerator will be a synchrotron dedicated to clinical and other biomedical uses of heavy ions, and it will deliver fully stripped ions at energies up to 800 MeV/nucleon. A key element in the design of an accelerator which will operate in a hospital environment is to provide a high performance control system. This control system will provide accelerator modeling to facilitate changes in operating mode, provide automatic beam tuning to simplify accelerator operations, and provide diagnostics to enhance reliability. The control system being designed utilizes many microcomputers operating in parallel to collect and transmit data; complex numerical computations are performed by a powerful minicomputer. (3 refs.)

99845 Synchrotron radiation lead shielding of the vacuum chambers for LEP. G.Chapman, O.Grobner, G.Linser, T.Perry, G.Schmidlin (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2340-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The high linear power density and the energetic photon spectrum in LEP impose a complete radiation shield around the vacuum chamber. The absorp-

tion and scattering of the photons in the vacuum chamber has been studied with the use of the Monte Carlo shower program EGS in view of defining the lead shielding required for acceptable dose levels. To avoid the excessive production of ozone or of corrosive products in the air surrounding the vacuum chamber it is proposed to apply the lead shield directly onto the aluminium profile. In this way the cooling circuits of the vacuum chamber can cool the lead shield which will later be necessary at increased LEP energies. Different methods of bonding the lead to the aluminium have been studied and have resulted in a cladding process using a tin-lead solder joint. This method has been applied to aluminium tubes of up to 12 m length and to full size prototype vacuum chambers. (8 refs.)

99846 **Determination of the sextupole components for the superconducting low-β_v insertion of the CERN intersecting storage rings.** A.Verdier (LEP Div., CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2424-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Sextupole components were introduced in the quadrupoles of the superconducting insertion of the ISR in order to maintain the momentum acceptance of the machine in spite of the large β_h modulation resulting from the horizontal betatron mismatch and to a lesser extent to correct the variation of β^*_v with momentum. The matching of the off-momentum closed orbit at the top of the stack was the procedure which made it possible. This matching is practically eqivalent to a correction of the second order chromatic aberration since all the off-momentum closed orbits are almost matched one it is performed. With the tune values used in the ISR for stacking and physics running, withdrawing the insertion sextupoles would provoke a loss of luminosity of the order of 5% which is modest but logical. Indeed the sextupoles have to compensate at the most a decrease of about 2% of the quadrupole strength. (6 refs.)

99847 **Searches for 'Arnold diffusion' and 'chaotic' motion in the beam-beam interaction.** D.Neuffer, A.Riddiford, A.G.Ruggiero (Fermilab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2427-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The results of long time computer simulation searches for 'Arnold diffusion' in beam-beam interactions at $\bar{p}p$ collider parameters are presented. No evidence of significant diffusion is found, consistent with beam storage for many days without 'blow-up'. 'Chaotic' motion is observed in 2-D simulations at $\bar{p}p$ parameters by use of reversability tests, and Lyapunov exponents for the chaotic motion are measured. This motion appears at the intersections of low-order resonances. Chaotic motion in 1-D simulations and in simulations with tune modulation can also occur. The conditions for the appearance of chaotic motion are explored as well as its relationship with 'beam blow-up'. (6 refs.)

99848 **Perturbation of radial oscillations in superconducting cyclotrons due to asymmetric dee voltages or phases.** M.M.Gordon (Cyclotron Lab., Michigan State Univ., East Lansing, MI, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2439-41 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Like many other cyclotrons, the new superconducting cyclotrons frequently operate with ν_r close to unity, and must actually accelerate the beam through the $\nu_r=1$ resonance in the central region and again just prior to extraction. The spiral shaped dees in these machines are designed to operate the equal voltages and prescribed relative phases, and deviations from these values significantly perturb the radial oscillations. An analysis of these effects, including those produced by the spiral electric gaps, is outlined and the results compared with those from a magnetic field bump. Possible applications to the control of orbit centering are discussed and illustrated with data from detailed orbit computations. (1 ref.)

99849 **Second order effects of a sextupolar field on betatron oscillations in a storage ring.** A.Jejcic (Lab. de l'Accelerateur Lineaire, Orsay, France).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2445-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Calculations concerning the betatron oscillations in a storage ring lattice comprising a lumped element sextupole field are presented. The method used is based on the second order approximation of the averaging method. The existence of singular points inside the region of the phase space defined by the separatrix is assumed. Formulas are given permitting the calculations of the size of the corresponding intersecting invariant curves and a simple expression is deduced for the betatron tune shift. The results are compared to those obtained by a tracking program. A good agreement between them is noticed. (3 refs.)

99850 **A dispersion-free long straight section for a fixed-field alternating-gradient synchrotron.** P.F.Meads,Jr..
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2448-50 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The FFAG synchrotron is generally designed to be 'scaling' in order to assure that resonances are not crossed. In compact designs, where the spiral angle and radial gradient are very high, it is necessary to depart from pure scaling by inserting radial cuts in order that there be room for RF cavities, etc. It is shown that a doubly symmetric set of six gradient magnets will provide an insertion that matches the structure for all momenta, providing in addition a long drift space that is free of dispersion. With the space thus provided for RF cavities, very high repetition rates are possible. Such a ring also provides an attractive means of accumulating equilibrium distributions of feeble heavy ion beams by placing a stripping foil in the dispersion-free section. (6 refs.)

99851 **On improving the chromatic effects of storage rings with antisymmetric insertions.** J.Claus, M.Cornacchia, E.Courant, F.Dell, G.Parzen (Brookhaven Nat. Lab., Upton, NY, USA), A.Garren.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2451-3 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
High luminosity storage rings require good chromatic behavior for beams with large momentum spreads. This requires that the effects of half-integer structure resonances for off-momentum particles be minimized. The authors show that a lattice with antisymmetric insertions can be so designed that the driving term for the half-integer structure resonance is suppressed by cancellation of successive pairs of high-beta multiplets. Hence, even though the periodicity is half that of a lattice with symmetric insertions, the chromatic properties are similar. (1 ref.)

99852 **Coupling and decoupling in storage rings.** S.Peggs (European Organisation for Nuclear Res., Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2460-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The accidental or intentional introduction of solenoids and skew quadrupoles into a storage ring couples the transverse motion, unless the lattice is trimmed. Coupling can cause, for example, irreversible emittance blow up at injection (protons), resonance excitation, flat beam blow up in collision (electrons), and can destructively modify the beam-beam equations of motion. Apart from these effects themselves, not many diagnostics are available to guide compensation attempts. After developing a matrix description of coupling the paper analyses the compensation of a lattice insertion, and goes on to show how random errors can be handled close to a coupling resonance. The global decoupling of random errors in the SPS, achieved by the observation of eigenfrequencies on a spectrum analyser, is described. Rough estimates show that global compensation usually makes further (local) compensation unnecessary. (3 refs.)

99853 **Simulation of the beam-beam effect during injection, accumulation and acceleration in LEP.** S.Myers (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2466-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The beam-beam program is used to simulate noncollision conditions for LEP. These results are used to facilitate the choice between horizontal and vertical separations at the interaction points and to quantify the required amount of separations. It is shown that in certain cases the residual beam-beam kicks during injection with separated beams can cause severe 'blow-up' in the transverse beam emittance and thereby lead to a reduction in the apparent injection efficiency. Results are also shown for transient effects which occur while the beams are brought into collision. (11 refs.)

99854 **Studies of the chromatic properties and dynamic aperture of the BNL colliding beam accelerators.** G.F.Dell (Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2469-71 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The PATRICIA particle tracking program has been used to study chromatic effects in the Brookhaven CBA (colliding beam accelerator). The short term behavior of particles in the CBA has been followed for particle histories of 300 turns. Contributions from magnet multipoles characteristic of superconducting magnets and closed orbit errors have been included in determining the dynamic aperture of the CBA for on and off momentum particles. The width of the third integer stopband produced by the temperture dependence of magnetization induced sextupoles in the CBA cable dipoles is evaluated for helium distribution systems having periodicity of one and six. The stopband width at a tune of 68/3 is naturally zero for the system having a periodicity of six and is $\sim 10^{-4}$ for the system having a periodicity of one. Results from theory are compared with results obtained with PATRICIA; the results agree within a factor of slightly more than two. (8 refs.)

99855 **Dipole shuffling in the Fermilab Energy Saver.** L.P.Michelotti, S.Ohnuma (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2472-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Permuting the magnets in an accelerator can modulate the adverse effects of field errors on particle orbits; imperfections in magnetic fields can be made to cancel one another by paying some attention to their arrangement. In particular, careful ordering gives a certain measure of control over resonances excited by field nonlinearities. Such considerations were used in assigning superconducting dipoles to the Fermilab Saver. The authors call this activity by the suggestive name 'shuffling'. The lowest order effect of field errors is closed orbit distortion caused by variations in dipole strength. To reduce it, a strategy may be developed based on either measured values of $\int B dl$ or the NMR magnetic field measurements. They found, however, that placing the magnets randomly did not degrade the orbit enough to warrant this, especially since the improvement eventually would have been nullified by misaligned quadrupoles. The closed orbit therefore was not included explicitly in their shuffling program, but they substantiated, after the fact, the argument for ignoring it. (3 refs.)

99856 **Generalization for the Hofmann-Zoter combined-function formulation for application to 50×50 GeV e^+e^- storage rings.** L.E.Sakazaki, R.M.Talman (Newman Lab. of Nuclear Studies, Cornell Univ., Ithaca, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2475-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Though all existing strong-focusing electron storage rings have separated-function lattices, the combined-function lattice would reduce energy loss to synchrotron radiation. Robinson (1958) and Hofmann and Zotter (1977) have shown how to overcome the anti-damping that was once thought to rule out this possibility. Their formulation is generalized to achieve a more realistic machine design having FODO cells to incorporate the inevitable straight sections between magnets and to allow for any subsequent insertion of nonlinear elements. An analysis is performed to estimate the energy savings for a 50×50 GeV e^+e^- facility using combined-function magnets. (5 refs.)

99857 **Computer modeling of internal targets in electron storage rings.** R.P.Maloney, R.C.York, J.S.McCarthy, B.E.Norum (Dept. of Phys., Univ. of Virginia, Charlottesville, VA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2484-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The effect of thin (1-50 $\mu g/cm^2$) internal targets on beam quality in electron storage rings is evaluated. The internal target is modeled assuming that scattering is the result of elastic collisions between the beam electrons and the target nuclei. A screened Coulomb potential is used and single and plural scattering mechanisms are included. A storage ring particle tracking code, DIMAT, was modified to include the internal target model and used to obtain the results discussed. Beam particle loss distributions and bean envelope 'growth times' are given are discussed in light of damping mechanisms inherent in electron storage ring designs. (6 refs.)

99858 **Storage ring filling via direct production of electron and positrons by high energy protons.** S.Conetti (Inst. of Particle Phys., McGill Univ., Montreal, Canada), A.G.Ruggiero.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2693-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
In the context of the proposals to build an electron proton colliding facility at Fermilab, the authors present a new scheme for the electron ring injector,

ased on the production of high energy electrons or positrons by a suitably repared 100 GeV high intensity proton beam. With this scheme one can chieve electron ring filling times of a few minutes, while avoiding the instabilities associated with low energy injection 83/0800-2693$01.00. (10 refs.)

9859 The beam bunching system for the Chalk River superconducting yclotron. E.A.Heighway, C.B.Bigham, J.E.McGregor (Chalk River Nuclear abs., Atomic Energy of Canada Ltd., Chalk River, Ontario, Canada).
EEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2809-11 (Aug. 1983). 1983 Particle Accelerator Conference. Accelerator Engineering and Technolgy, Santa Fe, NM, USA, 21-23 March 1983).
he bunching system for the tandem accelerator-superconducting cyclotron is f the buncher-rebuncher type. It consists of a low energy gridded buncher efore the tandem that produces a time focus at the tandem stripper, comined with a high energy buncher between the tandem and the cyclotron to orrect for debunching of the beam produced by energy straggling in the tripper. To meet the cyclotron design energy resolution of 5:10^4 the bunch ength produced at the cyclotron has to be less than three degrees in RF hase. (11 refs.)

9860 Injection and extraction for use. G.Hinderer, F.Hinterberger, .Kienle, W.Schott, U.Trinks, W.Wilhelm, E.Zech (Phys. Dept., Tech. Univ. unchen, Garching, Germany).
EEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2809-14 (Aug. 1983). 1983 Particle Accelerator Conference. Accelerator Engineering and Technolgy, Santa Fe, NM, USA, 21-23 March 1983).
he injection onto the first cyclotron orbit differs essentially from injection chemes for normal conducting sector cyclotrons because of two reasons: 1) he central region is occupied by the RF-cavities; 2) the stray field between he sectors is strongly nonscaling with the mean field level. An appropriate njection and extraction system was developed using a series of superconducting channel magnets which cause practically no field perturbation outside and roduce field levels of several Tesla inside. The injection path is below the nedian plane in the region of the circulating orbits. The accelerated beam vill be extracted with an electrostatic septum (10 MWm). Single turn extraction is achieved primarily by the acceleration voltage of 2 MV/turn, giving a urn-separation of 2.5 mm for 300 MeV/u and Q/A=0.5. The separation nay be increased by coherent betatron-oscillations. (6 refs.)

99861 Antiproton yield optimization in the CERN Antiproton Accumulator. C.D.Johnson (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2821-3 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The setting-up and optimisation of antiprotons injected into the Antiproton Accumulator was initially based upon the measurement of circulating antiprotons by integration of their Schottky signals. This has now been supplemented by amplitude distribution measurements using an internal target. Also, the more readily detectable pions, muons and electrons, injected along with the antiprotons, give information on machine aperture and orbits, which can serve as a monitor of injection conditions during antiproton stacking. (6 refs.)

99862 Pulsed beam chopper for the PSR at LAMPF. J.S.Lunsford, R.A.Hardekopf (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2830-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A traveling-wave beam chopper has been designed to provide properly structured negative-ion beam to the Proton Storage Ring (PSR) and other LAMPF users. The chopper must provide a 20-mrad kick with pulse rise time <5 ns for the 750-keV H^- ions in the injector transport line. Variable pulse lengths from 15 ns to 750 μs at repetition rates up to 16.7 MHz must be generated in synchronization with the PSR circulation frequency. Parameter studies led to an optimized design combining good deflection efficiency and bandwidth with minimum deleterious effects from plate-to-plate coupling. Both positive and negative 600-V pulses, with lengths up to 1 ms and maximum 10% duty factor, can be generated to drive the deflectors. (4 refs.)

99863 A three-dimensional field program. M.H.Foss (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2856-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The high-energy microtrons studied at Argonne National Laboratory (ANL) require complicated magnetic field shapes. A three-dimensional infinite-permeability magnetic field program was written to show that poles and coils can be devised to produce these fields. The program is in Hewlett-Packard 9845B BASIC, which limits the active mesh to about 30000 points. In some problems the number of useful points can be greatly increased by placing virtual pionts one plane beyond the active mesh. The program has four parts: (1) prepare the problem description file, (2) load the starting mesh, (3) relax the mesh, and (4) output results. Preliminary results indicate that the magnet edge can be quite 'hard' and suggest that the required field shapes can be produced. (1 ref.)

99864 Prototype sector magnets for the GeV electron microtron (GEM). R.B.Wehrle, J.H.Norem, W.F.Praeg, R.H.Swanstrom, K.M.Thompson (Argonne Nat. Lab., Argonne, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2859-61 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Three prototypes of the sector magnents for GeV Electron Microtron accelerators have been designed. The first is a full scale, 168 ton prototype for one-half of a 2 GeV Double Sided Microtron (DSM) sector magnet. The successful fabrication and testing of the pole pieces for this prototype has demonstrated that their required close tolerances for flatness and parallelism can be met. The second magnet is an approximate two-thirds scale model of one step at the low energy end of the hexatron sector magnet designed for the 4 GeV Electron Microtron (GEM). The measured fields demonstrate that the field falls off faster than an 'Enge-short-tail' and error fields are at low levels and are controllable. A third prototype magnet exactly duplicates the full scale geometry of the first three full orbits of the GEM sector magnet from entrance to exit points. (6 refs.)

99865 Energy Saver partial ring power tests. G.Tool, R.Flora, P.Martin, D.Wolff (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2889-91 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
As installation of the Energy Saver progresses, completed sections of the ring are operated to test subsystems and their interactions. The authors describe the power and quench protection tests in the 1/8 ring operation (3/4 of A sector) completed in June 1982, and in the more recent 1/3 ring operation of E and F sectors. (4 refs.)

99866 Operation of the Tevatron satellite refrigerators for 0.75- and 2.0-kilometer-long magnet strings. C.H.Rode, R.A.Andrews, R.Ferry, J.Gannon, J.Makara, M.Martin, D.Mizicko, J.Misek, T.Peterson, J.Theilacker (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2892-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
In January 1982, the authors started a five-month-long run of three satellite refrigerators, each attached to 250 meters of magnets. Two additional satellite refrigerators were operated, one as a liquefier, and the other to cool B12 Magnet Test Facility. They were all powered by the first two of the compressor buildings, located 1.0 kilometer apart, each housing four, two-stage screw compressors. During most of this period the Central Helium Liquefier was operating, providing supercritical helium. In November 1982 the authors commissioned eight additional refrigerators, each with its 250 meters of magnets, as well as two additional compressor buildings. In February 1983 an additional four refrigerators with magnets were started up. The remainder of the project is being started up this spring (1983). (5 refs.)

99867 Performance of the new cryogenic vacuum system at the Bevatron. R.T.Avery, T.F.Henderson, K.D.Kennedy, J.R.Meneghetti, J.R.Alonso (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2895-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A cryogenically cooled liner has been installed within the Bevatron to achieve 10^{-10} Torr vacuum. Features and performance of this liner are described, including achieved pressures, residual gas composition, cryo heat loads, leak rates through moving and static seals, and cool-down and warm-up times. (2 refs.)

99868 Oxygen deficiency hazard induced by helium release in accelerator tunnel. D.P.Brown, J.H.Sondericker (Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2898-900 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Tests to investigate oxygen deficiency levels due to release of helium into the CBA tunnel are described. Results of the tests indicate that the helium stratifies and spreads quickly in the horizontal plane. This demonstrates that adequate warning of possible asphyxiation hazards can be achieved. When oxygen deficiency monitors are located at ceiling level they may be spaced at intervals of 60 m or more and still achieve acceptable results. (no refs.)

99869 Helium refrigeration system for BNL Colliding Beam Accelerator. D.P.Brown, Y.Farah, R.J.Gibbs, A.P.Schlafke, W.J.Schneider, J.H.Sondericker, K.C.Wu (Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2901-3 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A Helium Refrigeration System which will supply the cooling required for the Colliding Beam Accelerator at Brookhaven National Laboratory is under construction. Testing of the compressor system is scheduled for late 1983 and will be followed by refrigerator acceptance tests in 1984. The refrigerator has a design capacity of 24.8 kW at a temperature level near 4K while simultaneously producing 55 kW for heat shield loads at 55K. When completed, the helium refrigerator will be the world's largest. Twenty-five oil-injected screw compressors with an installed total of 23250 horsepower will supply the gas required. One of the unique features of the cycle is the application of three centrifugal compressors used at liquid helium temperature to produce the low temperatures (2.5K) and high flow rates (4154 g/s) required for this service. (no refs.)

99870 Performance of the NBS-LANL RTM injection line vacuum system. R.I.Cutler (NBS, Washington, DC, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2904-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A 1000 l/sec cryopump is used to provide the hydrocarbon-free vacuum required for the 100 keV electron beam transport line of the NBS-LANL Racetrack Microtron. The beam line is 3.5 cm in diameter and 4 m long. To overcome the low vacuum conductance of the beam line, it is pumped every 1/2 meter by a 15 cm diameter vacuum manifold which is connected to the cryopump. A single cryopump is used rather than several ion pumps to reduce costs and to provide easier starting. An oil-free roughing pump and sorption pump are used in the initial pumpdown. The vacuum system is all metal sealed. Vacuums of 3×10^{-6} Pa are reached in 8 hours from atmospheric pressure without baking out the system, and ultimate vacuums of 5×10^{-7} Pa are achieved. (3 refs.)

99871 Construction of vacuum system for TRISTAN accumulation ring. H.Ishimaru, T.Momose, K.Narushima, H.Mizuno, H.Watanabe, T.Kubo, H.Yamaguchi, M.Kobayashi, G.Horikoshi (Nat. Lab. for High Energy Phys., Ibaraki, Japan).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2906-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
An all aluminum-alloy vacuum system for the TRISTAN accumulation ring (2.5-8 GeV) is now under construction. Aluminum and aluminum alloys are preferred materials for ultrahigh vacuum systems of large electron storage rings because of their good thermal conductivity, extremely low outgassing rate and low residual radioactivity. The bakeout temperature of an aluminum alloy system is generally limited to approximately 150°C by the decrease in mechanical strength with temperature. If ordinary stainless steel components are mixed in an otherwise aluminum alloy system, effective bakeout of the stainless steel is often impossible because of the temperature limitations due to aluminum. Then the ultimate pressure is often limited by outgassing of the stainless steel components. Ordinary stainless steel components and stainless steel-aluminum transitions have been eliminated as much as possible from the TRISTAN design. Suitable aluminum alloy vacuum chambers, elliptical bellows, fittings, flange/gasket/bolt, nut and washer combinations, feedthroughs, gauges, optical windows, sputter ion pumps, turbomolecular pumps, valves and related aluminum alloy vacuum components have been developed. (6 refs.)

99872 The GANIL vacuum system—results. G.Rommel.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2914 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
GANIL is a heavy ion accelerator located in Caen near the sea in France. This accelerator consists mainly of two big separated sector cyclotrons. As GANIL must accelerate all ion spaces, problems of vacuum are particular. The author gives results from the vacuum of SSC1 which has been running since June 1982. (3 refs.)

99873 CBA main magnet power supply ripple reduction. G.Bagley, R.J.Edwards (Brookhaven Nat. Lab., Upton, Ny, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2923-5 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The preliminary results of a development program to minimize beam perturbation resulting from ripple current generated by the CBA Main Magnet Power Supply are presented. The assessment of the magnitude and causes of the ripple generated led to a modification of the SCR Gate Driver and the addition of a bandpass amplifier correction loop which gave significant improvement. A description of the changes made and the results obtained are included. A second design approach was developed in which the timing of the SCR gate pulses is directly determined by a VCO. The results reported with this VCO Loop indicate superior performance, particularly at frequencies below 60 Hz. A shunt transistor regulator design is proposed to minimize higher SCR switching frequency harmonics. (8 refs.)

99874 Software system for the operation of the TRISTAN-AR power supply. K.Endo, T.Kubo, A.Kabe, H.Fukuma (Nat. Lab. for High Energy Phys., Ibaraki, Japan), K.Arimoto, H.Aoki, H.Yamamoto.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2926-8 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

Many power supplies ranging from 1 KVA to 4 MVA are controlled remotely through the serial CAMAC data way. The programs for their operation have been combined to form a software system which includes functions such as current monitoring, interlock and status surveillance, current pattern data generation, current fine adjustment, data transfer and so on. (3 refs.)

99875 Digital simulation for TRISTAN AR magnet power supply and control system. T.Kubo, H.Fukuma, A.Kabe, K.Endo (Nat. Lab. for High Energy Phys., Ibaraki, Japan).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2929-31 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The TRISTAN AR Magnet Power Supply is the system for exciting the magnets to accelerate the electron and positron beam from 2.5 GeV to 8 GeV. To estimate its performance the digital simulation was performed using DDS (Digital Dynamics Simulator). The simulation method and the result are described. (9 refs.)

99876 Improved control system of the thyristor flicker suppressor for the KEK 12-GeV PS. S.Matsumoto, H.Baba, H.Sato, T.Sueno, K.Mikawa (Nat. Lab. for High Energy Phys., Ibaraki, Japan).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2932-4 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

Thyristor control system of the 20 MVar flicker suppressor has been improved essentially. The previous feed forward (FF) loop with each single phase reactive current detector of the MR magnet power supply was exchanged to the present by both FF- and NFB-loops. The FF-loops consist of a three phase reactive power detector of the MPS and a forcing pattern generator on the fast but steady line voltage flicker, sag and surge. The NFB-loops control by the slow parts of the flicker and the unbalanced line voltages. These detectors of the reactive power, the voltage flicker and the unbalance have been developed. Sampled voltage flicker data with 12 bit ADC are processed by Z-80A microcomputer system and the forcing pattern is generated by the system through 12 bit DAC into the loop. A typical voltage flicker including sag and surge has been reduced within ±1.5%, about 1/3 compared to the previous, at 66 kV primary line. (3 refs.)

99877 Regulator to control current sharing among parallel-connected power transistors. F.D.Wells, E.F.Higgins, M.E.Mauro (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2935-7 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

A current regulator is described that controls the peak current of a power transistor driving an inductive load, such as magnet coils. Presently, the current pulse has a 0.1- to 1-ms adjustable duration with duty cycle to 5%. Ultimately, the pulse length must by ~7 ms with 50% duty cycle. The peak current nominally is 200 A, as set by a reference pulse. Several transistors, each controlled by an individual regulator, are connected in parallel to provide the total peak load current. The regulators compensate for differences between the power transistors and assure equal current sharing among the collectors. The regulator comprises an 8-bit multiplying digital-to-analog (D/A) converter that drives the base of the power transistor, an 8-bit up-down counter, an analog differencing circuit, and a comparator. For control purposes, a current-sensing resistor in the transistor's collector produces the second input to the differencing circuit. Regulation is accomplished over a collector current range of 200±50 A per stage. (2 refs.)

99878 Present status of SOR. S.Asaoka, T.Igarashi, G.Isoyama, A.Mikuni, Y.Miyahara, H.Nishimura (Synchrotron Radiation Lab., Univ. of Tokyo, Tokyo, Japan).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2944-6 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

Recent progress and investigations of an electron storage ring, SOR, are presented. Stored current and beam life time increased considerably. Injection efficiency and the life time were studied critically. Especially the life time was found to depend on the pressure of the ring and effective momentum aperture related to betatron resonance as well as the Touschek effect. (no refs.)

99879 Permanent magnet storage rings for microlithography and FEL sources. J.Le Duff (Lab. de l'Accelerateur Lineaire, Univ. de Paris-Sud, Orsay, France), Y.Petroff.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3060-2 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

Permanent magnet technology is rapidly improving and it seems possible now to design and build dedicated electron storage rings for peculiar applications such as microlithography and free electron laser. A low capital cost as well as a low operational cost (no power supplies) may lead to industrial solutions. The authors describe two possible design studies for machines at energies of 240 and 500 MeV with some indications on an efficient injector. (9 refs.)

99880 Status of BESSY, an 800-MeV storage ring dedicated to synchrotron radiation. G.Egan-Krieger, D.Einfeld, H.-G.Hoberg, W.-D.Klotz, H.Lehr, R.Maier, M.Martin, G.Milhaupt, R.Richter, L.Schulz, E.Weihreter (Berliner Elektronenspeicherring-Gesellschaft fur Synchrotronstrahlung mbH, Berlin, Germany).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3094-6 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

BESSY is a national dedicated source for synchrotron radiation situated in Berlin (West). This facility includes a 800 MeV electron storage ring, a 800 MeV separated function injector-synchrotron and a 20 MeV preinjector-microtron. The critical wavelength of BESSY was chosen to be $\lambda_c=2$ nm. This corresponds to a maximum field strength of 1.5 T in the bending magnets at 800 MeV and a bending radius of 1.78 m. By this choice of the spectral range BESSY meets the demands of X-ray lithography and complements the hard X-ray laboratory HASYLAB at DESY (Hamburg). Together with the HASYLAB facility both laboratories are thought as national centers for research with synchrotron radiation. BESSY covers the spectral range in the infrared, VUV and soft X-ray region up to 5 keV photon energies. (4 refs.)

99881 Performance of the 800-MeV injector for the BESSY storage ring. G.von Egan-Krieger, D.Einfeld, W.-D.Klotz, H.Lehr, R.Maier, G.Mulhaupt, R.Richter, E.Weihreter (Berliner Elektronenspeicherring-Gesellschaft fur Synchrotronstrahlung mbH, Berlin, Germany).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3103-5 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The injector for the BESSY storage ring is an 800 MeV synchrotron with a 20 MeV microtron as preinjector mainly manufactured by Scanditronix AB. The synchrotron was designed as a separated function machine. The bending magnets, the focusing and the defocusing quadrupoles are powered by three independent White-circuits. These circuits are phase-locked to each other via a microprocessor. The repetition rate of the synchrotron is 10 c/sec. The max. extracted current measured at 570 MeV was 12 mA/50 ns. The emittance was $\epsilon_x=1.6\times10^{-6}$ πm rad, $\epsilon_Y=0.25\times10^{-6}$ πm rad. The energy was changed to 776 MeV in August 1982. The extracted current was 7 mA/50 ns. (no refs.)

99882 Status of the National Synchrotron Light Source. J.N.Galayda (Nat. Synchrotron Light Source, Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3109-11 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The status and performance of the NSLS 700 MeV ring and 2.5 GeV ring is described. Emphasis is placed on properties of the stored beam pertinent to synchrotron radiation production, the factors determining these properties, and efforts to improve performance of the rings. (11 refs.)

99883 Photon factory: status of storage ring. (KEK, Nat. Lab. for High Energy Phys., Ibaraki, Japan).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3130-2 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The 2.5 GeV electron storage ring of the photon factory is a dedicated synchrotron radiation source. The first beam was stored at the design energy on March 11, 1982. Experiments with synchrotron radiation was started in June. During this year, efforts have been devoted to investigation of the properties of the storage ring. Then, the stored beam currents were increased and the beam lifetime was improved. In February 1983, a superconducting vertical wiggler of 5 Tesla and a permanent magnet undulator have successfully come into operation. The spectra of emitted radiation were measured. (4 refs.)

99884 A 600-MeV ETL electron storage ring. T.Tomimasu, T.Noguchi, S.Sugiyama, T.Yamazaki, T.Mikado, M.Chiwaki (Electrotech. Lab., Ibaraki, Japan).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3133-5 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

A 600-MeV electron storage ring has been constructed in only ten months at a cost of 200 million yen at the Electrotechnical Laboratory (ETL) in Tsukuba. The 500-MeV high efficiency-high current electron linac being operated for high energy-dosimetric experiments serves as an injector. The ring consists of eight bending magnets (r=2m) and four triplets of quadrupole magnet. The circumference is 31.45 m and λ_p is 22 Å. The lattice order is 0/2 $B_dQ_fQ_dQ_fB_d$ 0/2. The harmonic number is 17. The maximum stored current is 160 mA and 1/e lifetime is 1.5 hours at present. The radiation is used for calibrating photometry and soft X-ray standards, photoelectric analysis of electronic materials, and LSI lithography. (7 refs.)

99885 A proposed lattice modification to the Daresbury SRS. G.Saxon (Sci. Engng. Res. Council, Daresbury Lab., Daresbury, England).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3136-8 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The Synchrotron Radiation Source (SRS) at Daresbury was the world's first purpose built X-ray source dedicated to synchrotron radiation experiments. Since the SRS was designed much further work has been carried out on the optimisation of radiation sources, and this has led to the realisation of the importance of source brightness. Accordingly a proposal has been made to upgrade the SRS by increasing the periodicity through the addition of further quadrupoles, in order to reduce the emittance of the stored electron beam by an order of magnitude. The practical implications of this change are discussed. (9 refs.)

99886 The stellatron—a strong-focusing, high-current betatron. C.W.Roberson (Office of Naval Res., Arlington, VA, USA), A.Mondelli, D.Chernin.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3162-4 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

By adding both a toroidal magnetic field and a strong focusing field to a betatron, the authors achieve high current capability together with the required energy mismatch tolerance. The resulting configuration is a combination of stellarator and betatron (stellatron). The authors consider the behavior of a stellatron, which provides quadrupole focusing and is analogous to an alternate-gradient strong focusing system in a toroidal field. (9 refs.)

99887 Successful betatron acceleration of kiloampere electron rings in RECE-Christa. D.Taggart, M.R.Parker, H.Hopman, H.H.Fleischmann (School of Appl. Engng. Phys., Cornell Univ., Ithaca, NY, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3165-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The authors describe first experiments in which the strong electron rings normally trapped in the RECE-Christa device are accelerated in a plasma-betatron-like arrangement. Using a cold, collisional background plasma (T_e=1-2 eV, $n_p=10^{11}$-10^{12} cm^{-3}) generated by the ring in a gas fill of 50-200mTorr H_2, electron rings with currents of up to 2 kA were accelerated from about 1 MeV to 2.5-3 MeV. It appears that this method may be useful in significantly extending the parameter range of betatrons, in particular its ring current into the 10 kA range. (12 refs.)

99888 Intense beam recirculation. J.G.Siambis (Lockheed Palo Alto Res. Lab., Palo Alto, CA, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3195-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The concept of racetrack-modified betatron recirculator-accelerator is introduced in order to recirculate intense-current electron beams under the same accelerating cavities several times (<10) before extraction. Design criteria are obtained and the parameter space of operation is given. (11 refs.)

99889 Intense ion ring acceleration in a flux compressing liner. R.J.Faehl, G.Gisler (Los Alamos Nat. Lab., Los Alamos, NM, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3201-3 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

Circular accelerators based upon increasing magnetic flux comprise one of the oldest classes of machines, the Betatron being a prime example. The authors have found that intense, charged neutralized ion rings can be accelerated to interesting energies by imploding a conducting liner on the field/ring configuration. Because the ring radius is not fixed, they find that the energy scaling varies from linear in the field ($p_\theta{}^2 \propto B_z$) at low energies to square root scaling ($\gamma \propto B_z{}^{1/2}$) at relativistic energies. Simple modeling has confirmed many of the characteristics they have seen in $2^1/_2$-D fully electromagnetic particle simulations. (10 refs.)

99890 A high-current racetrack induction accelerator. A.Mondelli (Sci. Applications Inc., McLean, VA, USA), C.W.Roberson.

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3212-14 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The energy and system scaling laws of the racetrack induction accelerator (RIA) are determined and its operating principles are discussed. This device is a cyclic accelerator that is capable of multi-kiloamp operation. Long pulse induction linac technology is used to obtain short acceleration times. The RIA circulates a high current beam through a linear induction module. The voltage gain relation is $V=V_M T_M/\tau$, where V_M is the voltage gain per pass, T_M is the module pulse duration and τ is the transit time of the beam around the accelerator. (5 refs.)

99891 Effect of synchrotron radiation in the proposed 4-GeV Argonne microtron. E.A.Crosbie (Phys. Div., Argonne Nat. Lab., Argonne, IL, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3218-20 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

Synchrotron radiation in the sector magnets of the 4 GeV microtron designed at the Argonne National Laboratory produces a small but noticeable distortion of the closed orbits of the system and a very significant growth of the horizontal and longitudinal phase space emittances. Because of the small apertures in the three 25 meter linacs, it is important that the expected growth of the beam be calculated as accurately as possible. A computer program has been written which follows the motions of individual electrons in the four dimensional horizontal and longitudinal phase space as they are accelerated in the system. As the electrons go through the sector magnets, they emit quanta at random with randomly chosen energies. The final results show 63% emittance (area/π) values of 0.15 mm mrad and 630 keV degrees for the horizontal and longitudinal phase spaces respectively. The 99% values are about 4.6 times larger. (4 refs.)

99892 Transverse beam containment in the ANL 4-GeV microtron. E.Colton (Phys. Div., Argonne Nat. Lab., Argonne, IL, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3221-3 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

Optical systems have been designed to contain the electrons during the acceleration form 0.185-4.0 GeV. These systems are located in the dispersive straight sections and maintain a matched dispersion free beam with $\beta^*=15.0$ m in the linac centers, and transverse beam waists in the centers of the dispersive straight sections. A thin-lens code has been developed to design the multi-energy system. Three version of the focusing systems have been evolved: (i) two quadrupole triplets for $E \leq 1.62$ GeV; (ii) a single triplet for $1.655 \leq E$ 2.215 GeV; and (iii) a pentaquad system for $E \geq 2.250$ GeV. For case (i) the author steps the exit edges for the 60° bending magnets so as to simulate a zero degree edge—this reduces vertical defocusing effects to an acceptable value. At the higher energies the exit edge angles are $-60°$. The entrance angles are 15° on the linac sides of the dipoles. Energy behavior of the Twiss parameters and quadrupole strengths are presented. (4 refs.)

99893 Conceptual design for a CW 1-GeV double-sided microtron. K.Hayakawa, K.Tsukada, K.Sato, T.Tanaka (Atomic Energy Res. Inst., Nihon Univ., Tokyo, Japan).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3224-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The design study of a double-sided microtron is presented. An idea and the results of beam optics of the first turn orbit in sector magnets and quadrupole magnets are described. (1 ref.)

99894 Analytical study of the generation and control of orbit errors in the ANL 4-GeV CW electron microtron design. R.L.Kustom (Phys. Div., Argonne Nat. Lab., Argonne, IL, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3229-31 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The 4 GeV CW electron microtron (GEM) design has 3 linac sections and 3 dispersive straight sections. Six 60° sector bending magnets separate the linac and dispersion straight sections. A magnetic optical system has been designed within the dispersive straight sections to contain the beam during the 36 or 37 return passes through the linacs. A major concern is the effect of small alignment or field errors on the equilibrium or desired orbit with a relatively strong focusing system. The results of an analytical study which shows the effect of small random errors on the orbit are presented. A study was also undertaken on the control of the orbit position by making error measurements in one dispersive section and making an angular adjustment with a small dipole in the preceding dispersive section. The analysis indicates that the orbit position can be adequately and easily controlled in the presence of random alignment and field errors. (2 refs.)

99895 150-MeV pulse stretcher of Tohoku University. T.Tamae, M.Sugawara, O.Konno, T.Sasanuma, M.Muto, K.Yoshida, M.Hirooka, Y.Shibazaki, K.Yamada, T.Terasawa, M.Urasawa, T.Ichinohe, S.Takahashi (Lab. of Nuclear Sci., Tohoku Univ., Sendai, Japan), H.Miyase, Y.Kawazoe, S.Yamamoto, Y.Torizuka.

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3235-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The paper describes the Tohoku University 150 MeV pulse stretcher and the results of the test operation. The ring stores a pulsed electron beam from the electron linac and converts it into a continuous one. The test operation has proved that it works successfully. Broadening of the extracted beam in the vertical direction due to a coupling resonance was observed in the early operation. This problem was resolved by readjustment of the tune. And an extracted beam of 1 μA has been obtained with a duty factor of 80%. The energy spread of the extracted beam was measured to be 0.2%. (1 ref.)

99896 Relativistic collective effect accelerator to reach ultrahigh energies. F.Winterberg (Desert Res. Inst., Univ. of Nevada System, Reno, NV, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3238-40 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

A collective circular particle accelerator is proposed, with the potential to reach ultrahigh particle energies, including large luminosities. In the accelerator an electron cloud is produced within a large toroidal magnetic solenoid by inductive charge injection through the action of a travelling magnetic wave running around the torus. At the same time, the travelling magnetic wave accelerators the electron cloud to relativistic energies. By continuous inductive charge injection the cloud can be relativistically densified and the cloud thus densified becomes the source of ultrastrong electric and magnetic fields, many times stronger than is possible using only externally applied fields. These large fields can then be used to keep ions in a circular orbit, and an accelerator with a circumference of 10 km could accelerate protons up to 10^3 TeV with luminosities up to 10^{33} cm^{-2} sec^{-1}. (6 refs.)

99897 Nuclotron status report. A.M.Baldin, S.A.Averichev, Yu.D.Beznogikh, A.M.Doniagin, E.I.Djachkov, I.B.Issinsky, A.I.Govorov, A.D.Kovalenko, G.G.Khodzhibagijan, L.G.Makarov, A.I.Mikhailov, V.A.Mikhailov, A.I.Pikin, I.N.Semeniushkin, A.A.Smirnov, I.A.Shelaev, B.V.Vasilishin, M.A.Vojevodin, A.G.Zel'dovich, L.P.Zinoviev (JINR, Dubna, USSR), A.A.Vasiliev.

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3247-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The outline of an accelerator of relativistic nuclei at an energy of 6 GeV/u is presented. The parameters of the accelerator and the characteristics of superconducting magnets with iron-shape magnetic field employed in it are given. (8 refs.)

99898 Overview of CW electron accelerator proposals. B.E.Norum (Dept. of Phys., Univ. of Virginia, Charlottesville, VA, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3250-1 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

Electron beams in the MeV to GeV energy range have been used for nuclear studies for the last thirty years. Existing and proposed high duty factor electron accelerators can be grouped into three categories. First, there are those involving a pulsed accelerator plus a pulse stretcher ring. In these machines short (on the order of 1 μsec) high current pulses are injected into pseudo-storage rings at repetition rates of 100 to 1000 Hz. The second category contains machines based on the microtron concept. The basic microtron consists of a short CW linac located between two 180° dipole magnets. The beam is passed through the linac several times, each time returning to the head of the linac by a trajectory of steadily increasing diameter. The third category (recirculated linac) could be considered as another variation of the microtron. It consists of machines wherein the beam is recirculated several times through a longer CW linac than is used in the microtron. (no refs.)

99899 ELSA, a stretcher and post accelerator for the Bonn 2.5-GeV electron synchrotron. D.Husmann (Phys. Inst., Univ. Bonn, Bonn, Germany).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3252-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

ELSA (electron stretcher and accelerator) operates in two different modes. Up to the maximum energy of the synchrotron it works at a constant magnetic field. The electrons from the synchrotron which runs at 50 Hz repetition rate are injected, stored, and ejected at a constant rate. In this operation mode the macroscopic duty cycle is 95% at least. In the operation mode of post acceleration which is possible up to 3.5 GeV the duty cycle is reduced to 60%. The intensity in this operation mode is 5% of that in the stretcher mode. Higher intensities are available at lower duty cycle. ELSA mainly is dedicated to feed a tagged photon facility. (16 refs.)

99900 Multi-GeV electron linac-pulse stretcher design options. R.C.York, J.S.McCarthy, B.E.Norum (Dept. of Phys., Univ. of Virginia, Charlottesville, VA, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3257-61 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The linac-pulse stretcher ring system is evaluated as a design for a high duty factor ($>90\%$), intense (240 μA), electron accelerator for operation in the 0.5 to multi-GeV (>4 GeV) region. Options within this system are discussed in light of their predicted initial and operational cost, flexibility, and reliability. The ramifications of the choice of a particular cavity type, accelerating gradient, repetition rate, beam pulse length, and number of beam recirculations for the linac design are discussed both with respect to the linac itself and to the pulse stretcher ring. The pulse stretcher ring concept is analysed in terms of injection schemes (single or multi-turn), extraction methods (half or third integer, chromatic or achromatic), and operation parameters (machine tune and chromaticity). (12 refs.)

99901 The Illinois cascade microtron a proposal for a high duty factor, intermediate energy electron accelerator. L.S.Cardman (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3267-73 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The Nuclear Physics Laboratory at the University of Illinois currently operates a 6-traversal microtron using a superconducting linac, MUSL-2, which provides 100% duty factor electron beams with energies between 2 and 80 MeV. The author has submitted to the National Science Foundation a proposal to construct a 750 MeV cascade microtron capable of delivering 100% duty factor beams with currents of up to 100 μA. Subharmonic RF splitting of the output beam will provide up to three simultaneous beams for experiments, with independently controllable currents (summing to 100 μA). The proposal also includes two large building additions and the major new experimental equipment needed to exploit fully the research potential of this new accelerator. (19 refs.)

99902 Status report on the normal conducting CW racetrack microtron cascade 'MAMI'. H.Herminghaus, B.Dreher, H.Euteneuer, K.H.Kaiser (Inst. fur Kernphys., Univ. Mainz, Mainz, Germany), M.Kelliher, R.Klein, H.J.Kreidel, M.Loch, U.Ludwig-Mertin, K.Merle, H.Schoeler, R.Schulze, P.Semmel, G.Stephan.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3274-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The first two stages (175 MeV) of the three-stage CW microtron cascade MAMI have been completed. The report concentrates on the design of the 2nd stage which, so far, has not been described in detail elsewhere. First beam had been obtained in February 1983, best beam transmission obtained so far is in excess of 94%, maximum extractable energy achieved so far is 187 MeV. (20 refs.)

99903 The NBS proposal for a one GeV CW racetrack microtron facility. S.Penner (NBS, Washington, DC, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3279-85 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
As part of a joint accelerator research project with the Los Alamos National Laboratory, NBS is now building a 200 MeV, high current, CW racetrack microtron (RTM). This machine will be used to provide CW electron beams to nuclear physics experimenters, and also as the injector for a second stage RTM to boost the final energy to one GeV. A building addition of 35000 square feet will house the second stage RTM and new experimental facilities. Subharmonic RF beam splitting is planned to allow up to three simultaneous beams for experiments, with currents up to 100 μA each. In addition, low and high energy beams at low currents for tagged-bremsstrahlung experiments can be delivered at the same time. (12 refs.)

99904 GEM, ANL 4-GeV CW electron microtron design. R.L.Kustom (Phys. Div., Argonne Nat. Lab., Argonne, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3286-90 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A six-sided hexagonal microtron has been chosen as the accelerator to generate the beams required to pursue a national research program at a CW 4 GeV electron laboratory. The basic components of the accelerator include an electron gun, chopper-buncher, a 23 MeV linac injector, a 23-185 MeV racetrack microtron (RTM), an interstage phase space matching section, asubharmonic cavity, a 185-4000 MeV six-sided microtron (hexatron), extraction systems, and various transport lines. The electron energy at the output of the gun will be 100 keV. The beam will be chopped and prebunched at 100 keV. The hexatron will be built with three 35 MeV linacs and six 60° sector bending magnets. The beam optics in the hexatron will use a quadrupole system in the dispersive straight sections. Final extraction will be accomplished by an electrostatic septum followed by a magnetic septum. The extraction septa will be moved between the orbits to select the different energies for extraction. (10 refs.)

99905 The Montreal electron accelerator proposal. G.K.Bavaria, P.Depommier, P.Hinrichsen, H.Jeremie, L.Lessard, J.P.Martin (Lab. de Phys. Nucleaire, Univ. de Montreal, Montreal, Canada).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3291-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A 50 MeV CW RTM electron accelerator has been designed at the University of Montreal. The system consists of an electron gun, a chopper-buncher, a preaccelerator and the 50 MeV RTM. The installation is essentially the first phase of what is hoped will one day be a 1 GeV Canadian electron facility. A general outline of the system is presented. The main topics discussed are the various system components, the beam optics calculations and some of the experimental equipment to be used in the proposed nuclear physics research program. (18 refs.)

99906 ALS II: the Saclay proposal for a 2-GeV, CW electron facility. B.Aune, C.Grunberg, M.Jablonka, F.Koechlin, J.Magne, A.Mosnier, B.Phung, F.Netter (CENS, Gif-sur-Yvette, France).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3296-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The transformation of the Saclay electron linac facility (ALS) into a 2 GeV, 100 μA CW electron facility is described. Polarized electrons will be available in the whole energy range. In order to reach the required performances, the linac is rebuilt with new klystrons and with the addition of a partial recirculation. The 100% duty cycle is obtained with a stretcher ring. (9 refs.)

99907 Superconducting materials for particle accelerator magnets. D.C.Larbalestier (Appl. Superconductivity Center, Univ. of Wisconsin-Madison, Madison, WI, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3299-303 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The support given to the production of superconducting composites by the needs of particle accelerators has been continuous over about 15 years, and many decisive advances, such as the development of twisted filamentary composites, have been made with this support. At present, interest appears to be focused on two areas: 5 Tesla conductors for present day accelerators such as the Energy Doubler and Isabelle, and 10 Tesla conductors for future very high energy machines. The Fermilab production program for the Energy Doubler conductor has enabled the costs, reliability, and production aspects of 5 Tesla conductors to be extensively explored with conventional Nb 46.5 wt.%Ti. Applications at 8-10 Tesla will require Nb-Ti or Nb-Ti-Ta at sub-4.2K temperatures or Nb_3Sn. For both conductors there are present developments which appear capable of pushing current densities to higher values. (34 refs.)

99908 A cathode follower power amplifier. S.Giordano, M.Puglisi (Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3408-10 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
In circular accelerators and particularly in storage rings it is essential that the total impedance, as seen by the beam, be kept below some critical values. A model of the accelerating system was built using a single ended cathode follower amplifier driving a ferrite loaded cavity. The system operated at 234.5 KHz with a peak output voltage of ±10 kV on the gap. The dynamic output impedance, as measured on the gap, was <15 ohms. (2 refs.)

99909 A linear and nonlinear analysis of high power RF amplifiers. M.Puglisi (Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3411-13 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
After a survey of the state variable analysis method the final amplifier for the CBA is analyzed taking into account the real beam waveshape. An empirical method for checking the stability of a nonlinear system is also considered. (3 refs.)

99910 The RF power plant of the SPS. H.P.Kindermann, W.Herdrich, W.Sinclair (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3414-16 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983). (1 ref.)

99911 Determination of the RF leakage field in the vacuum tank of the TRIUMF cyclotron. R.Poirier, D.Dohan, G.Dutto, T.A.Enegren, K.Fong, V.Pacak (TRIUMF, Vancouver, BC, Canada), R.Hohbach.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3514-16 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
In the TRIUMF cyclotron the dees are partially defined by the two halves of the quasi-circular vacuum chamber, which completely contains the 1 MW resonating cavity. A stray electric field or 'RF leakage' exists inside the dees and has occasionally caused problems to probes or other tank equipment. In order to understand the nature of this field a precise 1:10 scale metal model of the entire tank and resonator system has been built and is being investigated. Various resonances have been identified: the push-pull mode at 226 MHz and the push-push mode at 233 MHz; cross modes along the dee gap resonate at 243 MHz and 253 MHz. In the quasi-circular tank region outside of the main resonating cavity the Tm_{310} and Tm_{410} modes are mainly responsible for the configuration of the leakage field since they are closer to the operating frequency. The measurements are in reasonable agreement with the results of numerical relaxation calculation and with measurements in the cyclotron tank. (5 refs.)

99912 A four gap synchrotron RF cavity. W.R.Smythe (Nuclear Phys. Lab., Univ. of Colorado, Boulder, CO, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3517 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A proposed four gap synchrotron cavity is described here. The drift tube (140° long) is rigidly supported by a reentrant conducting structure near each end. Each support structure provides two accelerating gaps. The potential across each gap is approximately the same as the potential between the drift tube and the vacuum tank wall in the central region. The reentrant feature has the effect of a two-turn center tapped transformer, which is achieved in the cavity by passing one current surface through another by means of spokes and holes.

99913 Experience with a 51-MHz, 200-KV, aluminum RF cavity. R.Boni, V.Chimenti, S.Fortebracci, F.Tazzioli, G.Turchetti.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3566-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A 51 MHz, 200 KV, aluminum cavity, in vacuum, has been built, tested and set in operation on the Frascati storage ring. Problems encountered in building, vacuum sealing and conditioning are illustrated. Behaviour on the accelerator is also mentioned. (4 refs.)

99914 Thermal analysis and loss in shunt impedance of the LEP accelerating cell. I.Wilson, H.Henke (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3590-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Basic formulae governing thermal flow in water-cooled solids are given. By calculating the heat dissipation at room temperature of the LEP accelerating cell with the program SUPERFISH and then using this as input to the thermal analysis program DOT, the surface temperatures and losses at full power have been estimated. Good agreement is obtained when these LEP results are scaled and compared with measurements made on similar accelerating structures in PEP and PETRA. The calculated decrease in shunt impedance of 4.2% with respect to the room temperature value has been substantiated by experimental measurements on a prototype LEP cavity. (8 refs.)

99915 Field properties for a 4-GeV microtron sector magnet. K.M.Thompson, M.H.Foss, R.J.Lari (Argonne Nat. Lab., Argonne, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3611-13 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The central magnetic field uniformity and field edge shapes have been investigated for a 609 metric ton sector magnet designed for the 4 GeV electron microtron (GEM) at Argonne National Laboratory. The effect of a Purcell-filter on the central field uniformity was studied using the 2D magnetostatic computer program, TRIM. The effects on the shape of the edge field were studied for various geometries of endguard, pole tip shim, shield plate, pole edge shape, and coil. Both 2D and 3D programs were used for these latter studies and all results showed that the proposed design would produce acceptable field qualities. (8 refs.)

99916 Nuclear physics research requirements for electron and heavy ion machines. E.Vogt (TRIUMF, Vancouver, BC, Canada).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3684-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
There has been a great deal of interest in a variety of new machines intended to probe atomic nuclei for hadronic and quark aspects which lie beyond the familiar shell model view of nuclei. The author gives the physics perspective within which the proposals for such machines have arisen and discusses the two classes of tools—high energy CW electron machines and relativistic heavy ion machines—which lie at opposite ends of the arsenal being gathered for the pursuit of QCD in nuclei. The electron machines present a reasoned analytic approach to the simplest systems and the heavy ion machines a major thrust for startling new physics in the quark-gluon sea. (13 refs.)

99917 From accelerators to storage rings to ?. W.K.H.Panofsky (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3689-93 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Gives a general but highly subjective overview of the expectation for accelerators and colliders for high energy physics. (no refs.)

99918 Construction of a system for transport and focusing of ion bunches by the CV-28 cyclotron of IEN/Rio. H.E.Wolf, J.Eichler, S.de Barros, L.F.V.Paiva (Dept. de Fisica Nuclear, Inst. de Fisica, Univ. Federal do Rio de Janeiro, Rio de Janeiro, Brazil).
Rev. Bras. Fis. (Brazil), vol.12, no.4, p.639-62 (Dec. 1982). In Portuguese.
A detailed description of a system of magnetic lenses designed to transport the charged beam of the variable energy, model CV-28 cyclotron of the Instituto de Energia Nuclear is presented. The beam is transported from a switching magnet to a large experiment room. (1 ref.)

99919 Synchrotron radiation from the low-beta quadrupoles scattered back toward the short insertion of LEP. R.Del Fabbro.
Report INFN/AE-83/2, Ist. Naz. Fis. Nucl., Pisa, Italy (18 Feb. 1983), 15 pp.
By Monte Carlo calculation the synchrotron radiation produced by the LEP beam in the low-beta quadrupoles is evaluated. This radiation is simulated to scatter back along the beam pipe toward the short insertion of LEP in the mini-beta version. The back photon flux reaching the experimental insertion is calculated and the corresponding energy and delay time spectra are given as well as the azimuthal distribution. It results that the back-scattered radiation from the low-beta quadrupoles do not appear to be dangerous, mainly because the bulk of this radiation is delayed more than 200 nsec with respect to the crossing time. On the contrary the back radiation coming from the quadrupoles upstream the short insertion could be a more serious source of background. (6 refs.)

29.25 PARTICLE SOURCES AND TARGETS, PREPARATION AND TECHNOLOGY

(see also 07.77 Particle production and handling; targets)

99920 A new system for astrophysical nuclear reaction studies with radioactive ion beams. R.C.Haight, G.J.Mathews, R.M.White, L.A.Aviles, S.E.Woodward (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.245-7 (1 July 1983).
A beam transport system has been constructed for the production and use of secondary beams of radioactive nuclides for astrophysical nuclear reaction studies. This system is based on six magnetic quadrupole lenses. Beams of ^{7}Be and ^{13}N have been produced in the energy range 15-30 MeV. The cross section of the ^{2}H(^{7}Be, ^{8}B)n reaction is measured to be 58 ± 11 mb at $E_{7\mathrm{Be}} = 16.9$ MeV. (9 refs.)

99921 Mass spectrometric study of the negatively-charged krypton and xenon monofluorides. E.Minehara, S.Abe (Div. of Phys., Tokai Res. Establ., JAERI, Ibaraki, Japan).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.533-7 (1 July 1983).
The negative ion formation of KrF_2 and XeF_2 was studied by using a Penning ion source with radial extraction, and the extraction of KrF^- and XeF^- from the ion source was confirmed by observing the mass spectra of KrF_2 and XeF_2 in the KrF and XeF mass regions, respectively. (7 refs.)

99922 Experiments on a medium charge state duopigatron. Zhou Zhiyi, Chen Miao, Xu Mingjuan, Zhang Shaorong, Sun Chunchang (Shanghai Inst. of Nuclear Res., Acad. Sinica, Shanghai, China).
Nucl. Tech. (China), no.2, p.6-9 (April 1983). In Chinese.
Duopigatron is a medium charge state heavy ion source. The principle, construction, test system and some experimental results are given. 1-5+ charge state argon ions and 1-3+ nitrogen ions can be observed in the ion mass spectrum. The effects of the magnetic field of the source, the gas pressure, the arc voltage and extraction voltage on the ion current and their charge state are measured and discussed. (5 refs.)

99923 The slowdownatron: A suggestion for increasing stopping rates by using shaped magnetic field and absorbers. M.K.Sundaresan, P.J.S.Watson (Dept. of Phys., Carleton Univ., Ottawa, Ontario, Canada).
Can. J. Phys. (Canada), vol.61, no.8, p.1184-91 (Aug. 1983).
The authors suggest the possibility of combining a momentum separator, consisting of a uniform magnetic field at right angles to a beam of particles, with a shaped absorber to obtain enhanced stopping rates. It is shown that by suitably shaping the magnetic field, one can obtain a form of linear focusing and derive the relevant equations for the magnetic field and absorber. Straggling is taken into account. The authors show that with certain (optimistic) assumptions the device could give three orders of magnitude improvement in stopping rates. Other problems are outlined, and finally they discuss what such a device could be used for. (7 refs.)

99924 Conceptual magnet design for an iron-free colliding beam accelerator. C.Taylor, R.B.Meuser (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2042-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Superconducting accelerator magnets usually have magnetic iron yokes to obtain maximum magnetic field and to limit stray field. However, the iron is expensive and heavy. The smaller size and weight of an iron-free magnet can result in lower magnet and refrigeration costs. However, in a colliding beam accelerator the stray field from one ring produces aberrations in the field in the other. A way to eliminate this mutual interference is to surround each magnet with a coil that exactly cancels the field from the other ring magnet. That is expensive in terms of superconductor requirements. However, the cancellation of the external dipole field component is unnecessary. Only a small amount of superconductor is required for cancellation of the higher-order field-aberration components. Parameters for the iron-free magnet concept are investigated, and a preliminary conceptual design for an accelerator is presented. (3 refs.)

99925 Possibility of accelerating the light nucleus by KEK proton synchrotron. M.Kondoh, K.Muto (Nat. Lab. for High Energy Phys., Ibaraki-ken, Japan).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2045-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
An accelerating method of the light nuclei with charge-mass ratio of 1/2 by use of the proton synchrotron system of KEK, is described. The description is mainly on the ring accelerator system and the ion source is excepted. As the velocities of the extracted nuclear beam from the linac and from the booster synchrotron are half the present protons in this method, wider range of accelerating frequency than the present one is necessary for the ordinary acceleration method in the main ring synchrotron. To avoid much modification in RF system coming from the extension of frequency range, a method called multi-stage acceleration is applied. (1 ref.)

99926 The lattice design of the LEP electron positron accumulator (EPA). J.P.Delahaye, A.Krusche (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2050-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
In large accelerators, the lattice cell is generally made as simple as possible. Special requirements are then fulfilled by appropriate insertions (dispersion suppressors, low β schemes, wigglers, etc.). In small machines, where space is limited, the lattice cell itself has to deal with all the machine constraints and requirements. The lattice design method developed consists of splitting the superperiod into specialized sections. Each section is built up to fulfil some of the basic requirements, then matched to the neighbouring sections. The best parameter values are deduced from systematic variation in the analytical expression of the corresponding beam transfer matrix. Applied to the LEP electron positron accumulator (EPA), this method was very efficient in optimizing a large number of constraints. (7 refs.)

99927 ASPUN, design for and Argonne super intense pulsed neutron source. T.K.Khoe, R.L.Kustom (Phys. Div., Argonne Nat. Lab., Argonne, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2086-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Argonne pioneered the pulsed spallation neutron source with the ZING-P and IPNS-I concepts. IPNS-I is now a reliable and actively used source for pulsed spallation neutrons. The accelerator is a 500 MeV, 8-9 μa, 30 Hz rapid cycling proton synchrotron. Other proton spallation sources are now in operation or in construction. These include KENS-I at the National Laboratory for High Energy Physics in Japan, the WNR/PSR at Los Alamos National Laboratory in the USA, and the SNS at the Rutherford Appleton Laboratory in England. Newer and bolder concepts are being developed for more intense pulsed spallation neutron sources. These include SNQ at the KFA Laboratory in Julich, Germany, ASTOR at the Swiss Institute for Nuclear Physics in Switzerland, and ASPUN, the Argonne concept. ASPUN is based on the Fixed-Field Alternating Gradient concept. The design goal is to provide a time-averaged beam of 3.5 ma at 1100 MeV on a spallation target in intense bursts, 100-200 nanoseconds long, at a repetition rate of no more than 60 to 85 Hz. (8 refs.)

99928 Performance of the intense pulsed neutron source accelerator system. C.Potts, F.Brumwell, A.Rauchas, V.Stripp, G.Volk (Argonne Nat. Lab., Argonne, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2131-3 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The intense pulsed neutron source (IPNS) facility has now been operating in a routine way for outside users since November 1, 1981. From that date through December 1982, the accelerator system was scheduled for neutron science for 4500 hours. During this time the accelerator achieved its short-term goals by delivering about 380,000,000 pulses of beam totaling over 6×10^{20} protons. The changes in equipment and operating practices that evolved during this period of intense running are described. The intensity related instability threshold was increased by a factor of two and the accelerator beam current has been ion source limited. Plans to increase the accelerator intensity are also described. Initial operating results with a new H^- ion source are discussed. (7 refs.)

99929 Remote handling and accelerators. M.T.Wilson (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2138-41 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The high-current levels of contemporary and proposed accelerator facilities induce radiation levels into components, requiring consideration to be given to maintenance techniques that reduce personnel exposure. Typical components involved include beamstops, targets, collimators, windows, and instrumentation that intercepts the direct beam. Also included are beam extraction, injection, splitting, and kicking regions, as well as purposeful spill areas where beam tails are trimmed and neutral particles are deposited. Scattered beam and secondary particles activate components all along a beamline such as vacuum pipes, magnets and shielding. Maintenance techniques vary from 'hands-on' to TV-viewed operation using state-of-the-art servomanipulators. Bottom- or side-entry casks are used with thimble-type target and diagnostic assemblies. Long-handled tools are operated from behind shadow shields. Swinging shield doors, unstacking block, and horizontally rolling shield roofs are all used to provide access. (22 refs.)

99930 Long distance wideband optical fibre links for accelerator synchronization. H.H.Beger, D.Boussard (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2152-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The proper performance of a large scale accelerator complex like the CERN network of machines, requires the transmission, over long distances, of precise timing pulses. In most cases the timing pulses are derived from a master clock, and therefore the ultimate time accuracy of the pulses is determined by the quality of the transmission of the clock frequency itself. A similar problem arises when several accelerating stations are distributed around a large accelerator, or when two machines need to be synchronized RF-wise. In all cases the transmission of a CW wave in the frequency range of several hundred MHz over distances up to several kilometres is the key to a proper synchronization. The classical solution, using coaxial cables, is getting more and more difficult and costly, as the frequency and the length of the link increase. In this context the use of optical fibres as transmission media offers an attractive alternative, and indeed a 4 km link was installed in 1978 between the CERN SPS and its injector for the purpose of synchronizing the two machines. The authors report the technical performance of this particular link in terms of frequency response, signal to noise ratio and long-term stability. (10 refs.)

99931 The slotted coax as a beam electrode. G.R.Lambertson, K.J.Kim, F.V.Voelker (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2158-60 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The slot coupled TEM line has been employed at CERN as a pick up electrode in the GHz range. It is a compact and broad band device, and will be quite attractive if the coupling efficiency is competitive with an array of quarter wave loops. The authors study various properties of such a structure. They have analyzed the slot-coupled TEM line using simplifying assumptions. The results are in rough agreement with the tests carried out with a 50-slot model coupler. The experiments are still in a preliminary stage, and a more thorough investigation is necessary to understand the limitations of the simple theory. (7 refs.)

99932 Single bunch profile measurement using synchrotron light from an undulator. J.Bosser, L.Burnod, R.Coisson, E.D'Amico, G.Ferioli, J.Mann, F.Meot (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2164-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
For protons with energies up to 400 GeV classical theory shows that the critical energy of the synchrotron radiation due to the constant field of the bending magnets is in the far infrared with a negligible part in the visible light spectrum. However it was shown that the magnetic field discontinuity at the edges of the bending magnets shifts the spectrum to the visible region where the normal light detectors can be used. For the use of the SPS as a proton-antiproton collider at 270 GeV with p bunches having 10^{10} to 10^{11} particles and $\bar{p}$ bunches having 10^9 to 10^{10} particles, it was necessary to enhance the synchrotron light by an undulator and to develop a more sensitive and gated detector to get p and $\bar{p}$ single bunch profiles. (10 refs.)

99933 Single pass antiproton beam diagnostics of the CERN PS accelerator complex. G.Cyvogt, B.Frammery, A.Krusche, R.Maccaferri, M.Ruette, G.C.Schneider, E.Schulte (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2167-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The beam characteristics of every $\bar{p}$ bunch in the transfer lines and the CPS can be acquired by various monitors during a single pass and the information stored. The signals emanate from high sensitivity transformers, pick-ups, secondary emission grids and TV screens. After fast analysis and treatment the beam intensity, trajectory (positions), shape, transverse and longitudinal distributions are displayed in analog and/or digital form. Multiple shot storage is provided for some of these parameters. The paper describes the monitors and the signal processing, gives the special features of the storage systems, and presents typical results. (6 refs.)

99934 Computer modeling of the klystron. P.J.Tallerico, B.E.Carlsten (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2170-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A self-consistent ring model of the klystron interaction is being developed for use as a design tool, with the initial goal of improving the LAMPF klystrons to conserve electrical energy. A mathematical model that includes large-signal effects, relativity, harmonic and fundamental cavities, extended cavity fields, and self-consistent calculations of the induced currents is being developed. The model is self-consistent because the gap fields are calculated interactively, because the currents that drive the cavities are not known until after the beam traverses the cavities. Several test cases have been run, and the basic theory and results to data are discussed. (5 refs.)

99935 Reducing ferrite tuner power loss by bias field rotation. W.R.Smythe (Nuclear Phys. Lab., Univ. of Colorado, Boulder, CO, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2173-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
It has been suggested that ferrite tuners for RF cavities with the magnetic bias field perpendicular to the RF magnetic field would have greatly reduced RF losses. A simple model proposed allows the calculation of tuning characteristics for a variety of bias schemes. The model shows that the perpendicular bias scheme requires very much larger bias levels than does the parallel bias scheme in order to achieve the same tuning range with a particular ferrite tuner. However, further investigation with the model has led to the discovery that the use of perpendicular bias at low frequency and parallel bias at high frequency requires only a modest increase in the bias field. In effect, the ferrite is kept highly magnetized, reducing ferrite losses, and is tuned primarily by rotating the bias field direction with respect to the RF field direction. The resulting reduction in dissipation can significantly reduce the amount of ferrite required per cavity. (3 refs.)

99936 Polarimeters for the AGS polarized proton beam. D.G.Crabb, B.Bonner, J.Buchanan, J.A.Bywater, P.R.Cameron, M.Fujisaki, M.E.Hejazifar, A.D.Krisch, S.L.Linn, A.Perlmutter, G.Phillips, L.G.Ratner, J.Rice, J.B.Roberts, K.M.Terwilliger (Dept. of Acceleration, Associated Univs. Inc., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2176-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The report describes the three polarimeters which will be used to measure the beam polarization at the AGS polarized beam facility. The beam polarization will be measured before injection into the AGS, during acceleration, and after extraction from the AGS. The 200 MeV polarimeter uses scintillation counter telescopes to measure the asymmetry in p-carbon inclusive scattering. The internal polarimeter can measure the beam polarization at up to five selected times during acceleration. A continuously spooled nylon filament is swung into the beam at the appropriate time and the asymmetry in pp elastic scattering measured by two scintillation counter telescopes. This is a relative polarimeter which can be calibrated by the absolute external polarimeter located in the 'D' extracted beam line. This polarimeter uses scintillation counters in two double-arm magnetic spectrometers to measure clearly the asymmetry in pp elastic scattering from a liquid hydrogen target. The specific features and operation of each polarimeter are discussed. (1 ref.)

99937 An ionization profile monitor for the Brookhaven AGS. H.Weisberg, E.Gill, P.Ingrassia, E.Rodger (Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2179-81 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A non-destructive internal emittance device has been built for the AGS, with separate units to measure the horizontal and vertical profiles of the circulating beam. Positive ions from collisions of the beam with background gas are collected in a 3-kV/cm electric field onto a 64-channel parallel strip detector. Because positive ions rather than electrons are collected, profile broadening due to space charge is small. Tests indicate that a quantitative, reproducible and accurate measurement of beam size throughout the acceleration cycle is provided. (7 refs.)

99938 Continuous tune measurements using the Schottky detector. T.Linnecar, W.Scandale (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2185-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A continuous measurement of the betatron tune has been implemented in the SPS $p\bar{p}$ collider with hardware normally used for the detection of Schottky noise. Suitable values for the tunes and chromaticities are thus more easily achieved in a machine where the strong space charge effects of the two counter-rotating beams severely reduce the available space in the resonance diagram. The basic idea is to monitor the frequency of one of the betatron lines, f_β, together with the revolution frequency and to deduce the tune ν according to the formula $f_\beta=(n+\nu)f_{rev}$. The betatron lines which naturally appear as noise signals adding incoherently, are strongly enhanced by exciting the beam at the required frequency with a kicker. The whole system then forms a closed loop in which an oscillator excites the beam producing a coherent signal at the Schottky detector, this signal providing the reference to lock the oscillator frequency. The excitation, 50 W at 10.7 MHz causes particle loss (~3%/cycle) and emittance blow-up (~10%/cycle) restricting the use of the apparatus to setting-up periods. (1 ref.)

99939 A measurement of the transverse particle distribution in the presence of the beam-beam interaction. G.Decker, R.Talman (Lab. of Nuclear Studies, Cornell Univ., Ithaca, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2188-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The beam-beam interaction in e^+e^- storage rings causes significant beam size enhancement limiting the attainable luminosity. It is important to understand this effect, in particular the resulting particle distribution shape. Measurements at CESR have been made using an 'active' probe to obtain horizontal beam profiles and detailed information regarding the vertical distribution tail shape. An estimate of the effect of the probe on the beam is given and results are presented. (3 refs.)

99940 Beam diagnostic instrument at CESR. D.Rice, G.Aharonian, K.Adams, M.Billing, G.Decker, C.Dunnam, M.Giannella, G.Jackson, R.Littauer, B.McDaniel, D.Morse, S.Peck, L.Sakazaki, J.Seeman, R.Siemann, R.Talman (Cornell Univ., Ithaca, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2190-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Describes various beam diagnostic devices in use at CESR, an 8 GeV electron-positron storage ring operating primarily in the 4.7 to 5.5 GeV beam energy range. Getting the last 20% of performance depends to some extent on empirical tuning and appropriate presentation of various parameters is very important. Several devices are most useful in machine studies. The authors describe their operation. The individually regulated quadrupoles in CESR provide unique opportunities for lattice measurements and calibration of beam position monitors. (6 refs.)

99941 Fast lifetime measurements of stored e^+/e^- single bunches in PETRA and DORIS II utilizing the AC-signals of simple beam current transformers. W.Radloff, W.Kriens (DESY, Hamburg, Germany).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2193-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A monitor for fast lifetime measurements has been developed and successfully tested. The monitor pick-up consists of a standard broadband transformer device in a ring position with equidistant bunch spacing. It has an upper cut-off frequency of about 4 MHz which allows to measure simultaneously the lifetimes of up to 8 individual bunches in PETRA (2 in DORIS II). In the electronic section the AC-signals are separated, baseline-restored, stretched and finally digitized in a highly stable 15 bit AD-converter. The output data are fed then into a microprocessor that computes the average currents and their time derivatives. As a result lifetimes of up to 5×10^4 s can be measured in less than 2 seconds. Some measurements are reported. (6 refs.)

99942 Further development of instrumentation for the Tevatron beam dump. E.Harms, B.Hendricks, T.L.Williams (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2196-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Circuitry has been developed for remote monitoring of the Tevatron beam dump instrumentation package. This package includes an x-y beam position detector, calorimeters, and temperature sensing devices. Details of the electronics design as well as expected response to beam-on conditions are presented. (4 refs.)

99943 Applications of FASTBUS to beam diagnostics and experiment data systems. D.R.Machen (Sci. Systems Internat., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2328-30 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The author discusses the near-term use of FASTBUS in accelerator beam-diagnostics instrumentation systems, where an extra increment in system throughput and front-end processing speed can produce a greater understanding of the physical phenomena under study. The arguments and conclusions may be equally well applied to other similar data-handling problems requiring high bandwidth in the data system. (3 refs.)

99944 The Multiwire Secondary Emission Monitor and the emittance measurement of the AGS beam. W.T.Weng, I-H Chiang, G.A.Smith, A.Soukas (Accelerator Dept., Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2331-3 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A set of three stations of Multiwire Secondary Emission Monitor (MSEM) has been built and installed in the fast external beam line for the measurement of beam profiles. Each unit consists of two planes each with 30 nickel wires having a diameter of 5 mils. The signal is linear within the range of 10^{10} to 10^{13} incident protons on the wire and the resolution of the signal is well within a few percent. A least-square fitting routine has been used to extract the emittance and phase space parameters of the beam. The emittances obtained at various intensities will help one to understand the AGS acceleration process and to choose the optimal injection scheme for CBA. (4 refs.)

99945 On stochastic cooling of bunches in the colliding beam mode in high energy p-p storage rings. S.Chattopadhyay (SPS Div., CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2334-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Possible cooling rates for stochastic cooling of intense bunches of protons and antiprotons in the colliding beam mode in the Fermilab Tevatron and the CERN SPS $p\bar{p}$ colliders are estimated, based solely on the bandwidth of the cooling system and the phase-space structure of the bunches and found to be a few tens of hours for high frequency large bandwidth feedback systems typically in the 8-16 GHz range and higher. The feasibility of even such slow cooling schemes will depend on successful design of pick-ups, kickers and novel signal processing schemes in this high frequency regime, all of which demand detailed study. (4 refs.)

99946 A theoretical model and computer simulations to describe diffusion enhancement by the beam-beam interaction. D.Neuffer, A.Riddiford, A.Ruggiero (Fermilab, Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2430-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Several observers have speculated that the simultaneous presence of diffusion processes and the beam-beam interaction may lead to enhanced diffusion or beam loss greater than that present with either diffusion or the beam-beam interaction alone. To test those ideas the authors have developed analytical and numerical methods to estimate the magniutde and variation of this enhancement. They find substantial agreement between simulation results and theoretical model that describes diffusion enhancement caused by a major resonance located within the beam. They present results of beam-beam simulations with random diffusion which systematically cover fractional tunes between 0.0 and 0.5 and tune shifts between 0.0 and 0.10. Their theoretical model is tested systematically, and is found to provide an adequate approximate description of the phenomena. (8 refs.)

99947 Study of periodic tune modulation with the beam-beam effect. D.Neuffer, A.Riddiford, A.G.Ruggiero (Fermilab, Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2433-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Simulations of weak-strong $p\bar{p}$ collisions with a periodic tune modulation show the possibility of beam blowup at sufficiently strong modulation amplitudes. This beam blowup is associated with the appearance of nonrepeatable 'chaotic' trajectories and occurs when low order resonances are crossed by the modulation. The authors report results of an investigation of the dependence of this blowup upon the modulation frequency, with the modulation amplitude fixed. It is determine that a threshold frequency exists and modulations at frequencies greater than the threshold do not lead to beam blowup. (2 refs.)

99948 Analytic estimates for the dynamic aperture of nonlinear lattices. K.J.Adams (Lab. of Nuclear Studies, Cornell Univ., Ithaca, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2436-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
For an accelerator lattice containing non-linear elements, particle amplitudes outside a 'dynamic aperture' are unstable. An analytic procedure for estimating this aperture not depending on resonance assumptions is described. The amplitude x(N) aftr N iterations is expanded in powers of the initial amplitude x_0. Low order coefficients are obtained using the symbolic algebraic manipulation program REDUCE. For intermediate values of N (e.g. 100) these terms give an asymptotic description which, by particle tracking, is shown to be valid. This leads to an estimate of the dynamic aperture and to its possible enlargement. (2 refs.)

99949 MARYLIE: the Maryland Lie algebraic transport and tracking code. D.R.Douglas, A.J.Dragt (Univ. of Maryland, College Park, MD, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2442-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
MARYLIE is a FORTRAN-language beam transport and tracking code developed at the University of Maryland. It employs algorithms based on a Lie algebraic formalism for charged particle trajectory calculations, and is designed to compute transfer maps for and trace rays through single or multiple beam-line elements. This is done without the use of numerical integration or traditional matrix methods; all nonlinearities (including chromatic effects) through third (octupole) order are included. Thus, MARYLIE includes effects one order higher than those usually handled by existing matrix-based programs. (3 refs.)

99950 Investigation of stochastic beam growth with a nonlinear lens. M.Cornacchia, L.R.Evans, W.Kalbreier, H.K.Kuhn, S.Peggs (European Organisation for Nuclear Res., Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2454-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The problem of the onset of stochastic motion in a non-linear system is of considerable importance for the understanding of the long-time stability of beams in hadron storage rings in the presence of strong high-order nonlinear resonances. A nonlinear lens has been installed in the SPS in order to simulate resonances driven by the beam-beam effect or by magnetic field imperfections in superconducting storage rings. A criterion for the onset of stochastic motion is derived and compared with the results of computer simulations and of experiments performed on the machine. (4 refs.)

99951 Beam-beam synchrobetatron resonances. S.G.Pegs (European Organisation for Nuclear Res., Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2457-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Electron storage rings see dangerous beam-beam synchrobetatron sidebands which are almost invisible to single beams, for example the diagonal resonances $Q_z\text{-}Q_x=mQ_s$. Colliding protons and antiprotons in the SPS do not see diagonal sidebands, despite the absence of stabilisation by radiation damping. The report uses a strong-weak numerical simulation to show that an apparent tune modulation, induced by longitudinal collision point oscillations can cause synchrobetatron sidebands, to a distance of about $2Q_s$ from a beam-beam resonance. The concurrent analytic description illustrates several reasons why flat beams behave quite differently from round beams and why the SPS is so resonance free. Transverse electron trajectories can become stochastic beyond a critical longitudinal amplitude limit, making microbeta optics unstable. Round beam-beam sidebands are found to be stronger near $Q_z=2/3$ than near the diagonal. Chromaticity is more dangerous to the SPS as a source of (real) tune modulation, than the modulation due to collision point oscillations. (6 refs.)

99952 The lattice design and tolerance analysis of the CBA transport line. W.T.Weng (Accelerator Dept., Associated Univs. Inc., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2463-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The beam transport line from the AGS to CBA is 600 m long and consists of 70 bending magnets and 20 quadrupoles, as well as several special injection components. The beam has to bend 117 horizontally and drop 1.8 m in elevation. To insure that it has momentum acceptance of $\Delta P/P=\pm1\%$ and the transverse emittance dilution is within 30%, a detailed tolerance analysis has been carried out on the requirements of the AGS beam properties, magnetic field quality of the transport magnets, and misalignment errors. Field quality tolerances of $\Delta B_0/B<1\times10^{-3}$ for bending field, $\Delta G/G<5\times10^{-3}$ for gradient field and $\Delta B_2/B<2.5\times10^{-4}$ cm^{-2} for the sextupole components in the bending magnets are indicated. (4 refs.)

99953 The Fermilab Tevatron I debuncher ring. A.G.Ruggiero (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2478-80 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The Fermilab Tevatron I project includes two rings. One is an accumulator ring where subsequent pulses of antiprotons are accumulated by stochastic momentum stacking and the other is the debuncher ring. The author describes the design of the debuncher. The lattice of the debuncher has been designed with tree goals. First, the ring must fit closely around the accumulator.

Second, the lattice must be able to satisfy the primary function of the ring, which is bunch rotation and debunching of an antiprotoon beam before it is transferred to the accumulator. Finally, fast betatron stochastic cooling in two seconds must be included to keep the accumulator aperture as small as possible. (6 refs.)

99954 Errors in radio-frequency quadrupole structures. W.P.Lysenko (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2481-3 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Performance degradation caused by certain radiofrequency quadrupole (RFQ) machine errors was studied using an efficient 3-D particle tracing simulation code for a high-brightness example. Matched beams, for which no emittance growth occurs, exist for periodic structures and were used as input beams for particle tracing in the presence of errors. The author considered both slowly varying and fast (random) errors that destroy periodicity. Random dipole errors cause emittance growth because of the mismatches they introduce and also result in a motion of the beam centroid that causes a reduction in acceptance. Because of the way RQFs are manufactured, the random error amplitudes can be kept below harmful levels. More important are the slow errors, which are harmful because they reduce acceptance even though they maintain a match. Slow dipole errors steer the beam toward the wall, and voltage deficiencies cause instabilities in the longitudinal direction resulting in particles not being accelerated to full energy. (5 refs.)

99955 TBCI and URMEL—new computer codes for wake field and cavity mode calculations. T.Weiland (DESY, Hamburg, Germany).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2489-91 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Wake force computation are most important for any study of instabilities in high current accelerators and storage rings. These forces are generated by intense bunches of charged particles passing cylindrically symmetric structures on or off axis. The adequate method for computing such forces is the time domain approach. The computer Code TBCI computes for relativistic as well as for nonrelativistic bunches of arbitrary shape longitudinal and transverse wake forces up to the octupole component. TBCI is not limited to cavity-like objects and thus applicable to bellows, beam pipes with varying cross sections and any other nonresonant structures. For the accelerating cavities one also needs to know the resonant modes and frequencies for the study of instabilities and mode couplers. The complementary code named URMEL computes these fields for any aximuthal dependence of the fields in ascending order. The mathematical procedure being used is very safe and does not miss modes. Both codes together represent a unique tool for accelerator design. (25 refs.)

99956 Longitudinal instabilities with a non-harmonic RF potential. S.Erinsky, J.M.Wang (Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2492-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The authors consider the longitudinal instabilities of a bunched beam subject to a nonharmonic RF potential. Assuming the unperturbed bunch to be described by a Maxwell-Boltzmann distribution, their treatment is based upon the linearized Vlasov equation. The formalism developed is exact and, in particular, correctly describes the effect of the dependence on amplitude of the synchrotron oscillation frequency. They discuss the fast blowup limit, and extend Wang and Pellegrini's (1980) treatment of the microwave instability to include the case of a non-Gaussian bunch. Next, within the short bunch approximation, they derive the dispersion relation describing the Landau damping of the coupled bunch modes, resulting from the use of a Landau cavity. (8 refs.)

99957 Longitudinal instabilities of long Gaussian bunches. S.Krinsky, J.M.Wang (Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2495-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The authors present an overview of the longitudinal instabilities of Gaussian bunches subject to a harmonic RF potential. Their emphasis is on the behavior of long bunches having lengths greater than the wavelength of the perturbing electromagnetic fields. They exhibit the crossover between the dominance of the synchrotron modes and the coating-beam-like distortions of the bunch distribution, which occurs as the real or imaginary part of the coherent oscillation frequency becomes large compared to the synchrotron oscillation frequency. For a narrow band impedance the growth rate of the coasting-beam-like modes is determined by the average beam current, and for a broad band impedance the growth rate is determined by the peak current. They discuss the transition between these two regimes by considering the growth rate as a function of the bandwidth of the impedance. (4 refs.)

99958 A common transverse feedback damper for two beams during a stacking cycle. J.M.Wang (Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2498-500 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
During the stacking cycle at a proton storage ring, it often occurs that coasting and bunched beams coexist, rotating in the same direction. The problem of the two beams oscillating coherently with each other is formulated and discussed. The author demonstrates that when the tune distribution is dominated by the sextupole contribution, one common transverse dipole feedback system is enough to damp both the coasting beam and the bunched beam instabilities. (9 refs.)

99959 Threshold behavior for longitudinal stability of induction linac bunches. J.Bisognano, I.Haber, L.Smith (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2501-3 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The induction linac bunches of heavy ion fusion scenarios are strongly influenced by the longitudinal space charge impedance. This is in distinct contrast to relativistic bunches in storage rings where most of the data on stability have been obtained. Simulation results reveal that when space charge effects are large, the stability requirement of small growth rate relative to the synchrotron frequency for relativistic bunches is replaced by the relaxed condition of small growth rate relative to the frequency spacing of the space charge wave modes on the bunch. Dispersive effects from finite pipe size tend to make the lower frequencies less susceptible to instability than higher frequencies. Since induction modules have a high resistive component only for the lowest bunch modes, stability is better than would occur for a broadband impedance of comparable magnitude. These results indicate that long term longitudinal bunch stability is realizable for induction linac drivers for heavy ion fusion. (5 refs.)

99960 Stabilization of longitudinal modes in a high current betatron. E.P.Lee, A.Faltens, L.J.Laslett, L.Smith (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2904-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The momentum spread required to stabilize longitudinal modes in a proposed high current betatron is computed. (5 refs.)

99961 Beam breakup (BBU) instability experiments on the Experimental Test Accelerator (ETA) and predictions for the Advanced Test Accelerator (ATA). G.J.Caporaso, A.G.Cole, K.W.Struve (Lawrence Livermore Nat. Lab., Livermore, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2507-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
In linear accelerators the maximum achievable beam current is often limited by the beam breakup instability. This instability arises from the interaction of a transversely displaced beam with the dipole modes of the accelerating cavities. The modes of interest, the TM_{1n0} modes, have non-zero transverse magnetic fields at the center of the cavity. This oscillating field imparts a time varying transverse impulse to the beam as it passes through the accelerating gap. Of the various modes possible only the TM_{130} mode has been observed on the Experimental Test Accelerator and it is expected to surface on the Advanced Test Accelerator. (4 refs.)

99962 A simple method for damping transverse motion of a high intensity electron beam. D.S.Prono, G.J.Caporaso, J.C.Clark, E.J.Lauer, K.W.Struve (Lawrence Livermore Nat. Lab., Livermore, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2510-12 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Describes a simple electrostatic focusing method which efficiently damps transverse motion of a high intensity (both high current and high particle energy) electron beam. The principle is to create an electrostatic central force anharmonic potential field which phase mix damps transverse beam motion into increased beam emittance. The nonlinear electrostatic field is created by a very resistive wire (L/R time ~ 2 ns) strung axially down the accelerator vacuum pipe. Positive image charge equal to $\sim 1/2$ the negative beam charge is induced onto the wire. Since the beam self fields cancel to within $1/\gamma^2$, the resultant wire electric field dominates. Experimental results showing the guiding, focusing and damping of transverse motion are presented. (5 refs.)

99963 Beam breakup instability in RF linacs. F.S.Felber, D.Mitrovich, R.K.Cooper, P.B.Wilson (Western Res. Corp., San Diego, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2513-15 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Analytic and numerical calculations of the beam breakup instability in RF linac cavities are presented. Analytic calculations for single bunch beam breakup in pillbox cavities show that beam deflection x scales with initial deflections x_0, charge per bunch Q, accelerating gradient E_a, accelerator length z, and cavity wavelength λ as $x = x_0[1 + (Qz/\Sigma_0 E_a(0.4\lambda)^3)]$. This scaling is generalized to include the effects of periodic focusing on transverse emittance growth. Numerical simulations of multibunch beam breakup show growth of beam deflection amplitude from wake fields generated by preceding bunches. Wake field calculations using a transverse beam cavity interaction code are presented. (3 refs.)

99964 Comparison of delta function and Gaussian wakes for longitudinal tracking. D.Brandt (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2516-18 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The longitudinal motion of bunched beams in large storage rings has been simulated in synchrotron phase space, including the effects of wake-fields excited by the bunches themselves in the RF cavities. Using the delta-function wake-potential of the cavities requires a great deal of computing time and, in addition, the results depend on the number of superparticles considered. The computing time can be strongly reduced by using tables of wake potentials of a fixed bunch shape. The author investigates the case where the distribution is assumed to be Gaussian. The validity and limitations of this model as function of the beam intensity are analysed by evaluation of higher moments of the distribution (variance, skewness, kurtosis). This shows that the assumption of the shape remaining Gaussian is insufficient and yields misleading results when the beam current is too high. This phenomenon appears to be related to the manifestation of turbulence in the beam. (6 refs.)

99965 Limitations of bunch-current in LEP by transverse mode-coupling. B.Zotter (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2519-21 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The most severe limitation of beam-current in LEP will be a fast transverse instability of single bunches, which can be explained as coupling of transverse modes. These predictions are verified with experimental data from several operating machines. The dependence of the threshold on beam and machine parameters is investigated in order to optimize the performance of LEP. (5 refs.)

99966 Transverse instabilities in the Daresbury SRS. A.Jackson, N.Marks, M.W.Poole, G.Saxon, V.P.Suller, R.P.Walker (SERC, Daresbury Lab., Daresbury, Warrington, England).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2522-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Transverse instabilities can limit the achievable beam current in the SRS storage ring both in the single bunch mode and in the multibunch mode. It is shown that these instabilities originate in higher order modes in the accelerating cavities. The threshold of these instabilities can be greatly increased by the use of octupole fields. (5 refs.)

99967 The experimental study of a higher harmonic RF system in PETRA. R.D.Kohaupt (DESY, Hamburg, Germany).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2525-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
At the natural bunchlength the single bunch currents in PETRA are limited by satellite resonances and a new vertical instability, which causes a vertical blow-up of a particle bunch if the single bunch current reaches the threshold value of that instability. The 'PETRA instability' was explained in terms of head-tail mode coupling and according to this model the vertical blow-up was cured by bunchlengthening changing the longitudinal damping partition. The disadvantage of this kind of bunchlengthening is the increase of energy spread leading to a reduction of quantum life time during energy ramping. The satellite resonances are avoided by a careful steering of the longitudinal and

transverse tunes. A more effective method of bunchlengthening is the use of a higher harmonic RF system. Such a system was installed in PETRA. With the higher harmonic RF system the threshold current of the vertical 'PETRA instability' could be increased from 3 mA (natural bunchlength) to 15 mA (withhigher harmonic RF system). Besides bunchlengthening the higher harmonic system leads to a considerable reduction of satellite effects in the range of normal PETRA tunes. (4 refs.)

99968 Analytic and numerical studies of the modified betatron. T.P.Hughes, M.M.Campbell, B.B.Godfrey (Mission Res. Corp., Albuquerque, NM, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2528-30 (Aug. 1983).

(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The modified betatron concept has been proposed as a means of accelerating high current (kilo amp) electron beams to high energy. This device employs a toroidal magnetic field to overcome the space-charge limit on the current in a conventional betatron at low energy. The authors look at the injection, equilibrium and stability of the modified betatron. The main emphasis is on stability. An analytic dispersion relation is derived using a cold-fluid model of the beam. The results are compared to three-dimensional simulations performed with the electromagnetic PIC code IVORY. The nonlinear development of the negative mass instability is followed in the simulations. (12 refs.)

99969 Beam breakup instabilities in high current electron beam racetrack induction accelerators. B.B.Godfrey, T.P.Hughes (Mission Res. Corp., Albuquerque, NM, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2531-3 (Aug. 1983).

(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

Beam breakup and negative mass instability growth rates for a 1 kA, 40 MeV electron beam racetrack induction accelerator are computed. The device is taken to have four acceleration gaps, each with 0.2 MeV applied voltage and 15 ohm transverse impedence; the guide field is 2 kg. The authors find that the total amplification of the beam breakup mode is limited to five e-foldings provided that the cavity mode quality factor Q is 6. Thus, the negative mass instability, which grows several times faster, is the dominant consideration. However, they also find that the energy range over which the negative mass instability occurs can be narrowed substantially by reducing the guide field strength after the beam has been accelerated to about 12 MeV. This approach, coupled with beam thermal effects, not considered here, probably is sufficient to limit negative mass growth to acceptable levels in the racetrack accelerator. (11 refs.)

99970 A probability function to fit radial distributions in PARMILA simulation beams. G.P.Boicourt (Los Alamos Nat. Lab., Los Alamos, NM, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2534-6 (Aug. 1983).

(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

Proton or deuteron beams in linear accelerators have halos much too large to be described by the normal distribution. When the beam core is fitted to a normal distribution, the actual amount of beam past a given number of standard deviations is orders of magnitude above the normal distribution prediction. Knowing the distribution obeyed by beams would be helpful in evaluating beam spill using computer codes. Toward this end, a probability distribution has been found that fits PARMILA-generated radial beam distributions. The fitting distribution is a mixture of two generalized gamma distributions and fits both the beam core and the tail reasonably well. Its predictions in the halo region are substantially larger than normal distribution predictions. The distribution is described, examples of fits are given, and the ability to fit the tail is discussed. (3 refs.)

99971 Progress of experiment to study the limitations to beam transport in a periodic solenoid focusing channel. J.D.Lawson (Rutherford Appleton Lab., Chilton, England), E.Chojnacki, P.Loschialpo, W.Namkung, C.R.Prior, T.C.Randle, D.H.Reading, M.Reiser.

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2537-9 (Aug. 1983).

(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

An account is given of work carried out in preparation for an experiment on the transport of a high current electron beam through an array of solenoid lenses. The performance of grids for emittance enhancement, and measurements of beam profile and emittance are described. The effects of aberrations and nonlinearities are discussed. (6 refs.)

99972 The space charge computer program SCHAR. R.J.Hayden, M.J.Jakobson (Dept. of Phys. & Astron., Univ. of Montana, Missoula, MT, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2540-2 (Aug. 1983).

(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The space charge computer program, SCHAR, uses macrofilaments or macroparticles to model the effects of space charge in ion transport. The authors have attempted to verify predictions of SCHAR by reproducing measurements made on the LAMPF H^+ injector line. For beams with appreciable space charge, when SCHAR is run with the KV distribution utilized by TRACE, SCHAR agrees with TRACE. When the H^+ line measured beam profile is taken as the input to SCHAR, it reproduces the waist locations and beam emittance for the remainder of the transport line, something TRACE has failed to do. Various types of input beams, including KV and observed, may be utilized with the program. Beam transport elements incorporated are drifts, quadrupoles, solenoids, bend magnets (with pole face rotations) and RF bunchers. (no refs.)

99973 Studies of heavy ion beam transport in a magnetic quadrupole channel. J.Klabunde, M.Reiser, A.Schonlein, P.Spadtke, J.Struckmeier (GSI, Darmstadt, Germany).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2543-5 (Aug. 1983).

(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

In connection with the West German Heavy Ion Fusion Program the first stage (six periods) of a magnetic quadrupole channel (FODO type) to study the transport of intense ion beams was built at GSI. Different ion beams can be used and the variation of the brightness of these beams (hence of the tune depression σ/σ_0) is sufficiently large that regions of theoretically predicted instabilities can be covered. The initial studies are being carried out with a high-brightness beam of 190 keV Ar^+ ions and currents of a few mA. Since the pulse length is >0.5 ms and the pressure is between 10^{-6} and 10^{-7} torr partial space charge neutralization occurs. Clearing electrodes can be used to remove the electrons from the beam. Results of theoretical studies, measurements of charge neutralization effects and first results of transport experiments are reported. (9 refs.)

99974 Theoretical study of high-current beams in storage rings. I.Hofmann, I.Bozsik, A.Jahnke (Max-Planck-Inst. fur Plasmaphys., Garching, Germany).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2546-8 (Aug. 1983).

(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

In storage rings with a high current of heavy ions, as considered for drivers in inertial fusion, control of the resistive microwave instability and bunch compression against strong space charge have been identified as key questions. It is shown here that onset of the longitudinal microwave instability can be suppressed or at least delayed by Landau damping, if some fraction of the total beam intensity is used toform a stabilizing tail of the distribution function. The linearized theory dispersion relation is analyzed and computer simulation examples are given to demonstrate the nonlinear features. As an alternative method the stabilizing effect of finite bunch length is investigated numerically and a stability criterion is proposed on the basis of a broad-band resonator model centered at the cut-off frequency. Finally, it is shown by means of computer simulation that 30-fold bunch compression in a storage ring is possible practically without losses using only two RF harmonics. (7 refs.)

99975 A quadrupole beam transport experiment for heavy ions under extreme space charge conditions. W.Chupp, A.Faltens, E.C.Hartwig, D.Keefe, C.H.Kim, L.J.Laslett, R.Nemetz, C.Pike, S.S.Rosenblum, J.Shiloh, L.Smith, M.Tiefenback, D.Vanecek (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2549-51 (Aug. 1983).

(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

A Cs ion-beam transport experiment is in progress to study beam behavior under extreme space charge conditions. A five-lens section matches the beam into a periodic electrostatic quadrupole FODO channel and its behavior is found to agree with predictions. With the available parameters (≤ 200 keV, ≤ 20 mA, $\pi\epsilon_n \geq 10^{-7}\ \pi$ rad-m, up to 41 periods) the transverse (betatron) oscillation frequency (ν) can be depressed down to one-tenth of its zero current value (ν_0), where $\nu^2 = \nu_0^2 - \omega_p^2/2$, and ω_p is the beam plasma frequency. The current can be controlled by adjustment of the gun and the emittance can be controlled independently by means of a set of charged grids. (11 refs.)

99976 Application of dynamically consistent closures to hydrodynamic models of beams. J.W.-K.Mark, H.L.Buchanan, S.S.Yu (Lawrence Livermore Nat. Lab., Livermore, CA, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2552-4 (Aug. 1983).

(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

For applications to phenomena such as pinched beams in ion beam fusion or beams in dominant axial magnetic fields (ion sources, plasma lens etc.), in accelerators, dynamically consistent closure of hydrodynamical models is discussed within adiabatic assumptions mathematically analogous to that of Chew, Goldberger, and Low (1955) for magneto-hydrodynamics and that of Berman and Mark (1979) for galactic dynamics. Numerical comparison with particle codes is discussed for pinched beams. (8 refs.)

99977 Transport in rectangular quadrupole channels. E.Meier (Accelerator Dept., Brookhaven Nat. Lab., Upton, NY, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2555-7 (Aug. 1983).

(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

Multiple electrostatic quadrupole arrays can be produced in many different geometries. However, the fabrication process can be considerably simplified if the poles are rectangular. This is especially true for millimeter sized channels. The author presents the results of a series of measurements comparing the space charge limits in cylindrical and rectangular quadrupole channels. (no refs.)

99978 Space charge limits in ESQ transport systems. A.W.Maschke, J.Brodowski, E.Meier (Accelerator Dept., Brookhaven Nat. Lab., Assoc. Universities Inc., Upton, NY, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2558-9 (Aug. 1983).

(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

Describes the results obtained in a series of experiments done with a variety of different electrostatic quadrupole configurations, using a precision optical bench system. (1 ref.)

99979 Emittance growth of high current beams in transport lines. K.Bongardt (Kernforschungszentrum Karlsruhe, Univ. Karlsruhe, Karlsruhe, Germany).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2560-2 (Aug. 1983).

(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The RMS emittance increase of high current beams in transport lines, caused by nonlinear space charge forces, can be understood as the development of the initial particle distribution to an equilibrium one. For a small beam radius, one gets less RMS emittance increase and the equilibrium distribution is reached earlier than for a large beam radius. The beam can now be transported over a long distance without further RMS emittance growth in all 3 directions. These results are incorporated in the design of a funneling section for the high current linear accelerator of the HIBALL concept. (9 refs.)

99980 Collective beam instabilities caused by RF cavities in TRISTAN. T.Suzuki, Y.Chin, K.Satoh, K.Takata, K.Yokoya (Nat. Lab. for High Energy Phys., Ibaraki-ken, Japan).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2563-5 (Aug. 1983).

(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The works done at KEK to study the collective beam instabilities caused by the RF cavities in TRISTAN are summarised. The works include the higher-order mode loss, the longitudinal and transverse coupled-bunch instabilities and the single bunch fast instabilities for longitudinal and transverse motions. A design aim of 4 mA/bunch and two bunches per beam can be achieved when feedback systems for longitudinal and transverse dipole oscillations are used. The other cures such as the higher-harmonic cavities, the wigglers, the couplers and the change of radiation damping partition numbers are also desirable. (30 refs.)

99981 Transverse mode coupling in a bunched beam. Y.Chin, K.Satoh (Nat. Lab. for High Energy Phys., Ibaraki-ken, Japan).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2566-8 (Aug. 1983).

(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

Derives a formalism of the mode-coupling theory for a Gaussian bunch, starting from Sacherer's integral equation. The problem is reduced to solving the determinant equation for eigenfrequencies of coherent oscillations. Eigenfunctions are expressed as superposition of the linearly independent functions where higher radial modes and azimuthal modes are combined and rearranged into 'hybrid modes'. The theory is applied to explanation of the fast instability observed in PEP and to a preliminary estimate of the threshold current in the TRISTAN electron-positron storage ring. The transverse broad-band impedances of RF cavities in PEP and TRISTAN are calculated with the program code TBCI and characterized by a single low-Q resonator impedance. A satisfactory agreement with PEP experimental result is obtained. (11 refs.)

99982 Vertical instability in KEK booster. M.Suetake (Nat. Lab. for High Energy Phys., Ibaraki-ken, Japan), T.Kasuga, T.Kawakubo, I.Sakai, H.Someya, S.Takeda.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2569-70 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
In the KEK Booster Synchrotron, from one msec after injection to extraction timing, beam intensity is stable, though it is reduced to about one half during one msec after injection. An instability of the vertical direction is one of the candidates of the beam loss. The e-folding time of the instability is less than 0.1 msec, and it strongly depends on the beam intensity and the horizontal beam position. The author found that: (a) the instability occurred at 30 MHz and its bandwidth (FWHM) was 15 MHz, (b) the broad band coupling impedance resulted from several narrow band resonators, (c) these resonators were ferrite core bump magnets and kicker magnets. (no refs.)

99983 Beam shape distortion caused by transverse wake fields. A.W.Chao, S.Kheifets (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2571-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
As a particle bunch in a storage ring passes through a region with a transverse impedance, it generates a transverse wake electromagnetic field that is proportional to the transverse displacement of the bunch in the region. The field acts back on the bunch, causing various effects (such as instabilities) in the motion of the bunch. The authors study one of such effects in which a transverse impedance causes the beam to be distorted in its shape. Observed at a fixed location in the storage ring, this distortion does not change from turn to turn; rather, the distortion is static in time. To describe the distortion, the bunch is considered to be divided longitudinally into many slices and the centers of charge of the slices are connected into a curve. In the absence of transverse impedance, this curve is a straight line parallel to the direction of motion of the bunch. Perturbed by the transverse wake field, the curve becomes distorted. (8 refs.)

99984 The resistive longitudinal instability threshold in finite charged beams. A.Sternlieb (Soreq Nuclear Res. Center, Yavneh, Israel).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2573-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Heavy ion beams are considered as possible drivers in an inertial confinement fusion scheme. The high required intensities introduce space-charge effects. It has been shown analytically that a finite cold beam is longitudinally stable when a small resistive term is present. This is confirmed by simulations which show that for resistivities causing less than one e-folding of a perturbation over the bunch length, the beam is stable (unlike coasting beam), probably due to end reflections. However, for resistivities causing more than three e-foldings, the beam is unstable (emittance deteriorated exponentially). The author discusses the implication of this instability threshold for a few cases: (a) a full-scale driver model; (b) a multiple-beam driver; (c) single beam transport experiment—SBTE (LBL); (d) slow e-beam experiment (Maryland). (10 refs.)

99985 Choice of focusing strength and aperture for high energy synchrotrons and colliders. L.C.Teng (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2576-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
At low energies and low intensities the considerations in the choice of the focusing strength (betatron tune ν) for a synchrotron are the beam size and the orbit distortion due to field errors which, together, generate a geometrical requirement on the size of the beam pipe and the good field aperture. Indeed, the strong focusing principle was invented to reduce the necessary magnet aperture, thereby the cost of the magnets. The closed orbit distortion increases with ν and has been cited as the factor counteracting the desire to reduce the beam size indefinitely by going to arbitrarily strong focusing. At high energies and intensities and with modern technology this is no longer true. The beam size is generally negligibly small and the orbit distortion can be corrected to arbitrary desired accuracy. Studies of field errors and orbit distortions are now used for sizing the correction magnet system rather than the aperture. Other types of geometrical demands on the aperture arise from beam manipulations such as stacking and resonant extraction. These requirements tend to be local and can usually be satisfied by local lattice insertions (high-or low-β, high- or zero-dispersion etc.). (4 refs.)

99986 A 9.1-T iron-free Nb-Ti dipole magnet with pancake windings. W.Gilbert, S.Caspi, W.Hassenzahl, R.Meuser, C.Peters, J.Rechen, R.Schafer, C.Taylor, R.Wolgast (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2578-80 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
An eight-pancake Nb-Ti dipole magnet, with bent up ends, called D-10B has been built and tested. This magnet is a Nb-Ti version of a Nb_3Sn magnet designed to produce a 10-tesla dipole field in a 40 mm diameter aperture. The pancake design is used for the heavy 12000 ampere Nb_3Sn cable because of the mechanical difficulty in winding such a heavy cable into the conventional nested cylindrical shell configuration with a 2″ inner winding diameter. The Nb-Ti version operates at 1.8K, in He II, has superconducting cable half as thick as the Nb_3Sn cable, and operates at half the operating current: 6000 A rather than 12000 A at 10 tesla. Both magnets are approximately one meter long. (5 refs.)

99987 Wigglers for control of beam characteristics in LEP. J.M.Jowett, T.M.Taylor (LEP Div., CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2581-3 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Eight three-block dipole wigglers will be used in LEP to maximize luminosity and control other beam parameters such as emittance, damping rates at injection, energy spread and polarization. The excitation law for constant emittance (chosen, for example, to fill the dynamic aperture) and damping partition numbers is given. In contrast to conventional wigglers where orbit perturbation is avoided by means of a series of equal fields of alternate polarity, the LEP wigglers will use unequal fields and pole lengths. This allows one to retain a high potential asymptotic polarisation level together with an increased polarisation rate. The choice of the degree of field asymmetry is imposed by limitations on the transverse dimensions of the magnets and field levels, by polarisation requirements and by cost. A practical design of the proposed wiggler is presented. (3 refs.)

99988 Stochastic cooling in the CERN ISR during pp̄ colliding beam physics. E.Peschardt, M.Studer (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2584-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
When the ISR is used as a pp̄ collider a high-intensity proton beam in R1 collides with a low-intensity antiproton beam in R2 for periods of up to two weeks. The luminosity lifetime is increased with a vertical stochastic cooling system in R1 designed for currents up to 10 A with a total bandwidth of 3.3 GHz. Cooling rates up to 0.7%/h have been obtained. The R2 antiprotons are cooled vertically with a 100-600 MHz system which decreases the initial beam height by up to a factor 7 and increases the luminosity by a factor 1.3-1.4. A momentum cooling system in R2 (frequency range: 55-155 MHz) creates empty space within the p̄ stacking aperture. This allows several stacks from the antiproton accumulator (AA) to be stored in the ISR. With this system which uses the Palmer method it has been proved experimentally that momentum cooling and horizontal betatron cooling are obtained simultaneously if the betatron phase between pick-up and exciter is an odd number of half-betatron wavelengths. The cooling rate of the momentum cooling system which is power limited is typically 4%/h at 26 GeV/c. (6 refs.)

99989 Recent experience with antiproton cooling. G.Carron, R.Johnson, S.van der Meer, C.Taylor, L.Thorndahl (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2587-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Improvement of transverse stochastic cooling in cases where the pick-up-to-kicker distance is not optimal may be obtained by using a transmission-line filter that causes opposite phase shift at alternating Schottky sidebands. Improvement of the horizontal stack-core cooling in the antiproton accumulator by using a pick-up at a zero dispersion location is planned; the filter technique will make this possible. The improvement of the signal-to-noise ratio in the 250-500 MHz stack tail termination resistors is discussed, as well as some problems caused by undesired modes perturbing the pick-up response. (no refs.)

99990 Stability and signal suppression of Schottky signals from stochastically cooled beams. W.P.Kells (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2590-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Several treatments of stochastic cooling now exist which go far beyond the original conceptual picture of 'removing fluctuations from the Schott noise'. The trend has been to replace this original statistical picture with ensemble evolution equations amenable to continuum treatment. High performance P̄ accumulation systems, both designed and contemplated, attempt operation at the limits of system feedback gain, as dictated by instability thresholds and 'signal suppression' [SS] degradation. The many admitted as well as implicit assumptions and approximations associated with the current models are most questionable near the high gain limit. The author highlights a few of these assumptions by pointing out inconsistencies they lead to. In particular, a fundamental difference between transverse (including 'Palmer') cooling and filter cooling is revealed. (9 refs.)

99991 Fast betatron cooling in the debuncher ring for the Fermilab Tevatron I project. B.Autin (CERN, Geneva, Switzerland), J.Marriner, A.Ruggiero, K.Takayama.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2593-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Originally, the only function of the Fermilab antiproton debuncher was to compress the momentum spread of the injected antiproton beam using a bunch rotation technique. This operation is actually very fast and almost all the time between two injections can be used to cool the beam transverse emittance. The cooling is based on the stochastic method and designed to reduce the initial emittance of 20^{π} mm-mrad by an order of magnitude in two seconds. To achieve this performance, the betatron cooling is handicapped by the low value of η, the dispersion in revolution frequency with the particle momentum; η has indeed to be maintained small in order to keep the radio frequency voltage required for the bunch rotation within a reasonable limit; moreover, the momentum spread is small (0.2%), therefore a very broad bandwidth (2-4 GHz) is required to have an efficient sampling of the beam. Betatron cooling of low intensity beams (10^8 particles) is usually limited by the thermal noise since the signal is naturally weak; here it has taken advantage of the ample space left between the areas of the ring to dispose a great number of pick-up electrodes; furthermore, a low noise temperature of the pick-up and of the preamplifier is obtained using cryogenic techniques. (3 refs.)

99992 Signal suppression analysis for the momentum stochastic cooling with a multiple system. A.G.Ruggiero (Fermilab, Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2596-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The Tevatron I project at Fermilab depends very crucially on the momentum stochastic cooling to collect and store antiprotons produced by injecting protons on a target. The author analyses the closed loop system for momentum stochastic cooling. In the closed loop configuration the electronic feedback depends not only on the electronic component characteristics but also on the beam intensity and energy distribution. (5 refs.)

99993 Momentum precooling in the debuncher ring for the Fermilab Tevatron-I project. A.G.Ruggiero (Fermi Nat. Accelerator Lab., Batavia, IL, USA), J.Simpson.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2599-600 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The design of the antiproton source for the Fermilab Tevatron-I project (TeV-I) incorporates two separate rings. The accumulator ring uses a stochastic cooling/stacking system to accumulate sufficient number of antiprotons for use in the Tevatron collider. The debuncher ring rotates buckets and debunches antiproton pulses from the production target. This requires, in the debuncher, a choice of lattice transition energy very near the beam energy, resulting in very narrow spread in the circulation frequency. If the energy spread could be further reduced in the debuncher before the beam is transferred to the accumulator, operational improvements would result in: 1) the reduction of stochastic cooling power in the accumulator; 2) the acceptance of

a larger momentum bite of antiprotons in the debuncher (thus more antiprotons); 3) the reduction of momentum aperture in the accumulator. (2 refs.)

99994 Effects of RF stacking on cooling tail in the Fermilab antiproton accumulator. A.Ando, K.Takayama (Fermilab, Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2601-3 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A scheme has been recently proposed to produce a high-intensity antiproton beam in a stochastic cooling accumulator. According to this scheme, the coasting beam of $\bar{p}$'s extracted from the debuncher ring will occupy the injection orbit of the accumulator ring with a total momentum spread of about 0.2%. This beam is to be bunched adiabatically. Then the buckets are transformed to moving (decelerating) buckets, slowly enough to obtain as large a capture efficiency as possible. The amount of deceleration depends on the physical distance which must be cleared by the bunch. After deceleration is completed, the RF is turned off slowly to allow the beam to debunch adiabatically. The beam is now ready for stochastic cooling. The debunched beam is soon moved down in the stream by the tail cooling system in order to make room for the next stacked beam. (3 refs.)

99995 Synchrotron oscillations with very small η. A.Ando, K.Takayama (Fermilab, Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2604-6 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Synchrotron oscillations with very small η $(\gamma_T^{-2}-\gamma_0^{-2})$ cannot be regarded as ordinary pendulum oscillations because the nonlinearity resulting from higher-order kinematic terms becomes sufficiently significant so as to lead to modification of the standard bucket. The dynamics is important in momentum debunching with RF rotation. For instance, the dynamics has significant meaning in momentum debunching with RF rotation in the debuncher ring for the Fermilab TeV-I project. RF rotation is used for quick reduction of large momentum spread to a small one. This large momentum spread demands that the debuncher should have a very small $\eta \simeq 0.002$, because of engineering limitations of possible RF voltage. The above kinematic nonlinearity may eventually lead to undesirable diffusion in a debunched beam. The authors discuss how the nonlinearity is suppressed by adjusting the path length of an offmomentum particle with the help of sextupole correction magnets. (5 refs.)

99996 The moment approach to charged particle beam dynamics. P.J.Channell (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2607-9 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The author derives the hierarchy of moment equations that describes the dynamics of charged particle beams in linear accelerators and can truncate the hierarchy at any level either by discarding higher moments or by a cumulant expansion discarding only correlation functions. A procedure for relating the density expansion linearly to the moments to any order is developed. The relation of space-charge fields to the density has been derived; and an accurate, systematic, and computationally convenient expansion of the resultant integrals has been developed. (no refs.)

99997 Sequential bunch extraction in the Los Alamos PSR. T.F.Wang, R.K.Cooper, L.Smith (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2610-12 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
In the short-bunch, high-frequency operating mode of the future proton storage ring (PSR) at LAMPF, the extraction scheme will take out one bunch at a time. Because the ring only stores six bunches at most and because the bunching system is heavily beam loaded, each extraction can cause a substantial change in the average beam current and hence affects significantly the total bunching voltage as well as the phase synchronization between those remaining bunches and the voltage waveform. A time-dependent cavity-tuning scheme has been considered to retain the proper bunching voltage and phase relation. This work examines the stability of the phase synchronization, in the transient stage of extraction and cavity tuning. An equivalent circuit model is adopted, and the coupled nonlinear differential equations are solved numerically. It is found that the relative phase will remain stable and that the voltage variation is tolerable under the PSR proposed operating conditions. A comparison between the numerical and analytical solutions confirms the numerical results. (5 refs.)

99998 Electron beam dynamics in the CERN PS. Y.Baconnier, R.Cappi, R.Garoby, W.Hardt, K.Hubner, J.H.B.Madsen, J.P.Riunaud (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2613-15 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The 28 GeV proton synchrotron (PS) forms part of the chain of LEP injectors with the role to accelerate positrons and electrons from 0.6 GeV, the operating energy of the Electron/Positron Accumulator (EPA), to 3.5 GeV, the positron/electron injection energy of CERN's 400 GeV proton synchrotron (SPS) which then accelerates the particles to 20 GeV. The PS used as an electron synchrotron has to supply the SPS with 8 bunches at an intensity of $N_b=8\times10^9$ particles per bunch. Bunch length and energy spread must be chosen carefully to avoid transverse and longitudinal single-bunch instabilities (turbulence) associated with high peak currents in the SPS. Analysis of the beam dynamics in the combined function lattice of the PS shows that this requirement can be fulfilled if the damping-partition numbers are changed. A Robinson Wiggler is proposed for this purpose and a new additional RF system is needed to produce the required bunch dimensions in longitudinal phase space. (9 refs.)

99999 Computer simulation of multiple-beam final focusing systems for heavy ion fusion. I.Haber (Naval Res. Lab., Washington, DC, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2616-17 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Heavy ion fusion ignition systems which employ multiple beams to achieve the required ignition energies on a target offer a number of advantages over systems with a small number of beams. In addition to the higher phase space densities which can be transported, the use of multiple lenses reduces the chromatic and geometric aberrations in the final focusing system. Computer simulations are described here which show that, at least for a modest number of beams, the transverse space charge interaction between adjacent beams does not appear to cause significant final spot aberrations for parameters consistent with pellet ignition requirements. (3 refs.)

100000 The Wire Transport Code. G.J.Caporaso, A.G.Cole (Lawrence Livermore Nat. Lab., Livermore, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2618-20 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The Wire Transport Code was developed to study the dynamics of relativistic electron beam propagation in a transport tube in which a wire conditioning zone is present. In order for the beam to propagate successfully in the transport section it must be matched onto the wire by focusing elements. The beam must then be controlled by strong lenses as it exits the wire zone. The wire transport code was developed to model this process in substantial detail. It is able to treat axially symmetric problems as well as those in which the beam is transversely displaced from the axis of the transport tube. The focusing effects of foils and various beamline lenses are included in the calculations. (5 refs.)

100001 Reduction of effective emittance by stacking beamlets in phase space. M.R.Shubaly (Atomic Energy of Canada Ltd., Res. Co., Chalk River, Ontario, Canada).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2621-3 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Multiple aperture extraction systems are commonly used to produce high current ion beams. One disadvantage of such systems is the dilution of the beam brightness by the grids. Typically, for the seven beamlets from a hexagonal array with a central aperture, the beamlets occupy only one-quarter of the area of the ellipse enclosing them. Beamlet steering by aperture displacement is commonly used in neutral beam injectors to reduce the size of the beam. For realistic beams, typical of high current-density extraction systems, beamlets can be stacked in phase space to reduce the effective emittance of the beam. This paper presents the concept of the technique and the experimental verification. In initial tests, the emittance of a 150 mA hydrogen beam from three in-line apertures was halved using the technique. The reduction was not from reduction in the source size as this decreased less than eight percent. (1 ref.)

100002 Magnetic field and beam dynamics calculations for SuSe. W.Schott, G.Hinderer, P.Kienle, U.Trinks, W.Wilhelm, E.Zech (Phys. Dept., Tech. Univ. Munchen, Munich, Germany).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2624-6 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The SuSe magnet system is designed using the program GFUN3D. A small version of this program was connected to a general fit program by means of which the current in the main and trim coils was determined for a given isochronous mean field $\underline{B}(r)$. For beam dynamics calculations with the code GOC accurate fields $(\Delta B/B \lesssim 1\%)$ were used which were obtained by means of the program GFUN400 where the unique part of the magnet iron is subdivided into 400 elements at maximum. Several coil systems have been investigated. In an alternative design all coils have straight sections which are easier to manufacture than coils with negative curvature. The main coils have a largest radial extension of 3.08 m. There are 22 correcting coils inside each main coil. (6 refs.)

100003 RF exercises associated with acceleration of intense antiproton bunches at Fermilab. J.E.Griffin, J.A.MacLachlan, Z.B.Qian (Fermilab, Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2627-9 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Antiprotons for the Fermilab $\bar{p}p$ colliding beam project (Tevatron I) will be extracted from an 8 GeV accumulation ring in a few (1 to 3) bunches of $\sim 10^{11}$, a single bunch at a time. To preserve the stack as a source of subsequent bunches, each bunch will be removed from the dense core of the stack with an isolated bucket at harmonic number h=2. The longitudinal emittance of the bunches will be in range 1.5 to 2. eVs, roughly five times what the main ring usually accelerates with the installed 53 MHz RF system. Therefore, the bunch is to be narrowed on the accumulator extraction orbit to match a 2.5 MHz bucket in the main ring. By raising the 2.5 MHz voltage (harmonic number h=53), the bunch will be further narrowed in the main ring to span seven buckets of the principal system (h=1113). The bunch will then be captured adiabatically from the h=53 bucket into seven adjacent h=1113 buckets for acceleration to a 150 GeV flattop. At this energy the 2.5 MHz and 53 MHz systems will be used jointly to coalesce the seven bunches into a single h=1113 bucket for injection into the energy doubler. This paper describes unstacking in the accumulator, the adiabatic capture into seven bunches in the main ring, and the coalescing of the seven back into one bunch at 150 GeV. The expected performance of the whole sequence has been established by detailed particle tracking simulation. (8 refs.)

100004 Time and momentum exchange for production and collection of intense antiproton beams at Fermilab. J.Griffin, J.MacLachlan, A.G.Ruggiero, K.Takayama (Fermilab, Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2630-2 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Antiprotons for the Fermilab $\bar{p}p$ colliding beam project are accumulated by RF stacking of successive 8 GeV antiproton batches in a storage ring using stochastic cooling to reduce both transverse and longitudinal emittance. The rate of accumulation is increased 15-fold by interchange of bunch length and momentum spread of the antiproton bunches in a special purpose debuncher ring. Tightly bunched antiprotons are produced at the target by 120 GeV protons from the main ring. From 2.5×10^{12} protons every 2 seconds the debuncher receives 7×10^7 antiprotons, within a momentum bite $\Delta p/p=3\%$. These antiprotons are injected into mismatched stationary RF buckets in the debuncher so that synchrotron oscillation produces bunch rotation. After 90° of rotation followed by adiabatic debunching, the narrow time spread has been converted into a momentum spread $\Delta p/p=0.2\%$. The authors describe the RF technique used to shorten the bunches of the primary proton beam in the main ring and report test results. They describe the complementary procedures to be used in the debuncher and demonstrate the expected reduction of the momentum spread by particle tracking simulation. (11 refs.)

100005 A single bunch system for the Daresbury SRS. E.A.Hughes, T.Ring, B.Taylor (Sci. Engng. Res. Council, Daresbury Lab., Daresbury, Warrington, England).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2633-5 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Although the Daresbury Synchrotron Radiation Source normally operates at high current in the multibunch mode, some experimental users require only a few well separated bunches. A two stage RF chopper system produces a single 1 ns bunch from the SRS linear accelerator. A versatile timing system for synchronising the linear accelerator, booster synchrotron and storage ring,

which permits the single bunch to be loaded into any specified storage ring bucket, is described. Techniques of setting up and monitoring are discussed and illustrated by details of operational performance. (2 refs.)

100006 Electron cooling and accumulation of 200-MeV protons at Fermilab. T.Ellison, W.Kells, V.Kerner, F.Mills, R.Peters, T.Rathbun, D.Young (Fermi Nat. Accelerator Lab., Batavia, IL, USA), P.M.McIntyre.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2636-8 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Experimental measurements have been made of the cooling of 200-MeV protons by an electron beam of 1 to 3 A and an energy of 110 keV. These experiments are an extension of earlier measurements on the cooling of 115-MeV protons and were performed in the Fermilab experimental proton storage ring. At 200 MeV the proton beam lifetime in the storage ring is extended from 10 to 4000 sec with electron cooling. The cooling times with an electron beam current of 1 A were approximately 2 sec for momentum and 5 to 10 sec for transverse cooling of the proton beam. For proton intensities of approximately 2×10^6 particles, the six-dimensional phase-space density of the proton beam was increased by a factor of 2×10^5. These results and data on equilibrium proton distributions and frictional forces are in reasonable agreement with the theoretical predictions. In addition, the accumulation of successive 'hot' batches of protons into a cold core, i.e. stacking, has been demonstrated. (12 refs.)

100007 Design considerations on peak electrical fields and maximum beam currents for heavy ion RFQ linacs. P.Junior, H.Deitinghoff, K.D.Halfmann, W.Neumann, N.Zoubek (Inst. fur Angewandte Phys., Univ. Frankfurt/Main, Frankfurt/Main, Germany).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2639-41 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Aperture and frequency determine voltage limits with respect to sparking. For a corresponding application of Kilpatrick's criterion exact knowledge of peak electrical fields in the RFQ is required. Results of calculations for Bi^{2+} fusion injectors considered are presented. As a general result maximum beam current turns out approximately proportional to electrode voltage. Some notes on the influence of space charge models are reported. (14 refs.)

100008 Non-linear beam-beam effects in present and future storage rings; generalized Birkhoff method on conservative mappings. M.Pusterla (Istituto di Fisica, Univ. e Istituto Nazionale di Fisica Nucleare, Padova, Italy), G.Servizi, G.Turchetti.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2642-5 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A relevant application of the recent developments of nonlinear dynamical theories lies in providing the description and the consequent calculation of the interactions among charged particles that either belong to a given beam or to different beams in collision with each other in storage rings. The author considers the case of weak-strong beam-beam interactions for proton machines, which are dynamical conservative systems. The motion of a test-particle around its main reference orbit is analysed by a conservative mapping that follows from periodical kicks, due to the forces of the beam-beam collisions, that solicitate the otherwise regular betatron oscillations. Finally the effective spin polarisation of the beams after long performance in the presence of depolarising forces is considered. (6 refs.)

100009 Vlasov theory of signal suppression for bunched beams interacting with a stochastic cooling feedback loop. S.Chattopadhyay (SPS Div., CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2646-8 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The author develops a self-consistent Vlasov theoretic description of the dynamic distortion of incoherent Schottky signals from a bunched beam undergoing stochastic cooling, arising from beam feedback. In the situation of non-overlapping syncrotron bands, explicit expressions for the signal suppression factors are derived and evaluated numerically for a prototype high-energy storage ring. (3 refs.)

100010 Theory of bunched beam stochastic cooling. S.Chattopadhyay (SPS Div., CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2649-51 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A theoretical description of the time-evolution of a bunched beam subjected to stochastic cooling is provided. (5 refs.)

100011 A formulation of transversely coupled betatron stochastic cooling of coasting beams. S.Chattopadhyay (SPS Div., CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2652-4 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A formulation of stochastic cooling with coupled degrees of freedom, with emphasis on the tensorial signal suppression phenomenon for transversely coupled betatron stochastic cooling of coasting beams, is provided. The relevant expressions for the damping and diffusion coefficients and the elements of the signal suppression tensor are given in terms of the general cooling interaction harmonics. The formulation is necessarily abstract in order to provide a general framework of quantitative analysis and demands exact knowledge of the nature of the coupling interaction for it to be useful in any particular case. (3 refs.)

100012 Longitudinal phase space matching between microtrons at 185 MeV. H.Takeda (Argonne Nat. Lab., Argonne, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2655-7 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Electrons are accelerated to 185 MeV by a microtron. Then, they are injected into another microtron to boost the net energy up to a few GeV. Between the two microtrons both longitudinal and transverse phase space matching are required. The author considers a longitudinal phase ellipse matching which utilizes triple left-right-left sector dipoles to induce a negative phase angle shear. This is accomplished because a high energy particle travels a shorter distance through the dipole system than a low energy particle. (1 ref.)

100013 A review of the beam breakup problem in linacs. W.J.Gallagher (Boeing Aerospace Co., Seattle, WA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2658-60 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Beam breakup, or pulse shortening, may be described as a progressive shortening of the output beam pulse compared to the injected pulse length with increasing beam current, the pulse length reduction occurring from the later end of the pulse. The author reviews this effect in linacs. (21 refs.)

100014 Potential of a 3-dimensional halo charge distribution. K.Takayama (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2661-2 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A simple method for obtaining the expression of the electrical potential for a 3-dimensional non-uniform charge distribution is given. It is shown how the method can be used to obtain the expression for a 3-dimensional halo distribution. (3 refs.)

100015 Bunch lengthening in SOR. S.Asaoka, G.Isoyama, A.Mikuni, Y.Miyahara, H.Nishimura (Synchrotron Radiation Lab., Univ. of Tokyo, Tokyo, Japan).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2663-5 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Bunch lengthening in SOR, a 400 MeV electron storage ring dedicated for synchrotron radiation experiments, was found to be induced by a longitudinal coupled bunch instability. The bunch length which increases as a 1/5.8 power of the beam current, can be explained by the balance between the growth of the instability and Landau damping due to the spread of synchrotron frequency, and by introducing a weak frequency dependence of coupling impedance. In connection with this phenomenon, slow fluctuation of synchrotron radiation was found to come from a detailed unbalance of the equilibrium electron distribution on the longitudinal phase space. The Touschek life time of the expanded beam and Landau cavity to suppress the instability are described. (10 refs.)

100016 A first order space charge option for TRANSOPTR. M.S.de Jong, E.A.Heighway (Atomic Energy of Canada Ltd., Res. Co., Chalk River Nuclear Labs., Chalk River, Ontario, Canada).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2666-8 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
TRANSOPTR, a beam transport design code, incorporates automatic optimization of a beam transport system under general constraints. This optimization can be performed for either first order (with or without space charge effects) or second order calculations. Space charge effects are calculated in the x-y plane for continuous beams or in x-y-z space for bunched beams using a new approach. The method integrates a set of differential equations describing the evolution of the σ beam matrix along the main trajectory where the σ matrix represents the beam ellipsoid in phase space. A spatially uniform charge density approximation is used and emittance growth is assumed to be negligible. Changes in the optimum beam transport conditions of a system caused by space charge effects can be readily evaluated with this code. Some applications of the code are given. (7 refs.)

100017 A canonical integration technique. R.D.Ruth (Lawrence Berkeley Lab., Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2669-71 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The class of differential equations of interest here is that in which the equations are derivable from a Hamiltonian using Hamilton's equations. The exact solution of such a system of differential equations leads to a symplectic map from the initial conditions to the present state of the system. A characteristic feature of all explicit high order $(n>2)$ integration methods, however, is that they are not exactly symplectic, which would make the system artificially damped. The author develops an explicit third order symplectic map (i.e. a third order integration step that preserves exactly the canonical character of the equations of motion) and indicates the method for higher order maps. For a typical numerical integration, this method can be used to eliminate the noncanonical effects while providing the accuracy corresponding to a third order integration step. (4 refs.)

100018 The status of electron cooling at Novosibirsk (theory and experiment). Ya.S.Derbenev, N.S.Dikansky, V.I.Kudelainen, V.A.Lebedev, I.N.Meshkov, B.B.Parkhomchuk, D.V.Pestrikov, A.N.Skrinsky, B.N.Sukhina.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2672-5 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The recent developments on electron cooling at the Nuclear Physics Institute, Novosibirsk are given. Problems of getting an electron beam with low effective temperature, suitable for fast electron cooling, are discussed. (7 refs.)

100019 An optimization technique for computing chromatic corrections in heavy ion focussing systems. J.S.Steinhoff (Res. Dept., Grumman Aerospace Corp., Bethpage, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2677-9 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
An optimization algorithm is described for computing field strengths for a set of corrective sextupole magnets in a heavy ion focussing system. Initial results are presented which show that, in some cases, the beam transmission through a 1 mm pellet can be increased from an uncorrected value of about 60% to over 90%. The method should be useful for systems where, due to constraints or the presence of a number of abberations, no straight-forward theory exists for directly computing the field strengths. (7 refs.)

100020 Initial operation of ECR ion sources with CYCLONE. Y.Jongen, G.Ryckewaert (Lab. du Cyclotron, Louvain-la-Neuve, Belgium).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2685-9 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Two heavy ion sources, using the electron cyclotron resonance have been realized in Louvain-la-Neuve. They use a superconducting magnetic structure to confine the plasma. The operational characteristics are explained and present results are shown. Produced beams include fully stripped N, C and O, Ne^{9+} and Ar^{16+}. The source has been used as injector for CYCLONE and was found stable, reliable and easy to operate. (10 refs.)

100021 Polarization preservation in the AGS. L.G.Ratner (Accelerator Dept., Assoc. Universities Inc., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2690-2 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The successful operation of a high energy polarized beam at the Argonne Zero Gradient Synchrotron with the concommitant development of depolarizing resonance correction techniques has led to the commissioning of such a beam at the Brookhaven alternating gradient synchrotron (AGS). The author presents a detailed description of how it is planned to preserve the polarization during acceleration, and presents the 'game plan' for tuning through

some 50 resonances and reaching the goal of a 26 GeV polarized proton beam with greater than 60% polarization. (6 refs.)

100022 Operational characteristics of a radial extraction ion source with an injected electron beam. M.Abdelaziz, M.Abdelbaki, S.Zakhary (Nuclear Res. Center, Egyptian Atomic Energy Authority, Egypt).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2699-701 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
An RF ion source of the radial extraction type is modified by introducing an electron gun to supply electrons which interact radially with the source's plasma, thereby increasing ionizing density. A tungsten filament is used with an accelerating electrode, under the influence of axial magnetic field. Two plasma tubes have been tested with the same tube length (12 cm) and diameters 4 and 5 cm respectively. Glass-coated tungsten wires are immersed in the plasma as electrical probes. Two extraction electrodes of apertures 4 and 8 mm are used. The extraction characteristics indicate 15% increase in the extraction ion beam. (8 refs.)

100023 Dual arc chamber heavy ion source. E.D.Hudson (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2702-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A dual-arc-chamber heavy-ion source has been installed on ORIC. This source has exhibited a substantial improvement in performance for beams below mass 20. A 42 μA beam of $^{16}O^{5+}$ was extracted from ORIC using the dual-arc-chamber source and a 2.5 μA beam of $^{20}Ne^{5+}$ was obtained 1.5 minutes after turning on the arc voltage. (5 refs.)

100024 A cusped field H^- ion source for LAMPF. R.L.York, R.R.Stevens,Jr. (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2705-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The addition of the proton storage ring to LAMPF requires the development of a more intense H^- ion source. The goals of this development program are to produce a beam of sufficient quality to match the acceptance of the accelerator and sufficient intensity, quality, and duty factor to satisfy the operation of PSR as well as existing LAMPF requirements. The ion source concept which is best suited to these requirements is the multi-cusp negative ion source being developed at LBL by Ehlers and Leung (1980). This source has been shown to produce high quality beams of moderate current density (20 mA/cm^2). However, to produce an accelerator quality H^- ion source, additional development is required in the area of high-voltage extraction of high-brightness beams. (4 refs.)

100025 Status of the AGS polarized negative ion source. J.Alessi, A.Kponou (Accelerator Dept., Brookhaven Nat. Lab., Assoc. Universities Inc., Upton, NY, USA), R.Raymond, T.Sluyters.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2708-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Development of an intense polarized H^- source for the AGS continues at Brookhaven National Laboratory. Initial tests with about one milliampere, 40 keV pulsed neutral cesium beam, colliding with more than two milliampere polarized hydrogen atoms, produced about one-half microampere polarized negative ions, extracted at 20 keV. A new pulsed cesium source with an anticipated output of 5-15 mA and an improved neutralizer are under construction. (4 refs.)

100026 Polarization measurements at PETRA. D.P.Barber, H.D.Bremer, J.Kewisch, H.C.Lewin, T.Limberg, H.Mais, G.Ripken, R.Rossmanith, R.Schmidt (DESY, Hamburg, Germany).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2710-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Recent measurements of beam polarization in the electron-positron storage ring PETRA are presented. A method is described for compensating the depolarizing effects caused by vertical closed orbit distributions. This technique has been successfully applied, and reproducible polarization up to 80% has been obtained both in single beam and colliding beam operation with luminosities of about 3×10^{30} cm^{-2}s^{-1}. Polarization measurements as a diagnostic tool for studying other beam parameters such as absolute energy and momentum compaction factor are also briefly described. These latter measurements have been performed with the help of a fast depolarizing device. (7 refs.)

100027 Operating experience with an ion source in a superconducting cyclotron. T.A.Antaya, M.L.Malloy, J.A.Kuchar (Nat. Superconducting Cyclotron Lab., Michigan State Univ., East Lansing, MI, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2716-18 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The authors have developed a PIG ion source for axial insertion in the K500 cyclotron. The operation of the ion source has been limited to the requirements demanded by the operation of the cyclotron. These requirements have been for moderate charge state light heavy ions, of principally carbon, nitrogen and neon. The source design is more than adequate for moderate charge states with lifetimes of 8-12 hours for carbon and in excess of 15 hours for nitrogen and neon. They are now just starting to push the source to produce high charge states, and have not yet established whether this source design will be adequate. (4 refs.)

100028 An ECR heavy ion source for the LBL 88-inch cyclotron. D.J.Clark, J.G.Kalnins, C.M.Lyneis (Nuclear Sci. Div., Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2719-21 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
An electron cyclotron resonance heavy-ion source is under construction at the LBL 88-inch Cyclotron. This source will produce very high charge state heavy ions, such as O^{8+} and Ar^{12+} which will increase cyclotron energies by a factor of 2-4, up to A=80. It is a two-stage source using room temperature coils, a permanent magnet sextupole, and a 6-9 GHz microwave system. Design features include adjustable first to second stage plasma coupling, a variable second stage mirror ratio, high conductance radial pumping of the second stage, and a beam diagnostic system. A remotely movable extraction electrode will optimize extraction efficiency. The project includes construction of a transport line and improvements to the cyclotron axial injection system. The construction period is expected to be two years. (10 refs.)

100029 Polarized ^{3}He ion source based on the 2^3S_1 metastable state. R.J.Slobodrian, R.Labrie, R.Lapointe, L.Pouliot, J.Giroux, Y.Cagnon (Dept. of Phys., Univ. Laval, Quebec, Canada).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2731-3 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
This ^{3}He polarized ion source is based on the 2^3S_1 metastable atomic state. The authors produce an intense metastable beam, 6×10^{15} p.sec^{-1}.sr^{-1}, of energies between 0.07 and 0.1 eV, using a cold cathode discharge. The separation and focusing of Zeeman components ($F={}^1/_2$ $m_F={}^1/_2$) and ($F={}^3/_2$ $m_F={}^3/_2$) is effected with a sextupole of variable gap. An adiabatic RF transition enhances the nuclear polarization (theoretical) to 100%. Most design parameters of the source are now frozen for operation inside the HV terminal of a CN Van de Graaff, but the source is of universal use in (+) ion accelerators. (15 refs.)

100030 Developments of the CRYEBIS generation at Orsay. J.Arianer, C.Goldstein, H.Laurent, M.Malard (Inst. de Phys. Nucleaire, Orsay, France).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2737-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
CRYEBIS 2 is completed. The project is described. Main features are: 50 keV-3.5 A decelerated electron beam, 5T-1.6 m long superconducting solenoid at 2.3K. The gun to reach 10^4 A.cm^{-2} has been tested, and SILFEC 3, a smaller scale model of CRYEBIS 2, has been extensively used with a CW electron beam and joined cycles up to 6 kV-1 A. The deceleration of electrons is reliable (from 10 keV to 1.8 keV) and the production of atoms of metal species by means of a laser has been tested. (11 refs.)

100031 Optically pumped polarized ion source with 16.5-GHz ECR low source. Y.Mori, K.Ikegami, A.Takagi, S.Fukumoto (Nat. Lab. for High Energy Phys., Ibaraki-ken, Japan).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2740-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A new type of polarized H^- ion source which uses electron pick-up reactions of a low energy H^+ ion beam from electron-spin polarized sodium atoms has been developed at KEK. The authors have obtained 10~25 μA polarized H^- ion beam when the electron-spin polarization of sodium atoms was about (46~100)±8%. (5 refs.)

100032 A brighter H^- source for the intense pulsed neutron source accelerator system. V.Stipp, A.DeWitt, J.Madsen (Argonne Nat. Lab., Argonne, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2743-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Further increases in the beam intensity of the Intense Pulsed Neutron Source (IPNS) at Argonne National Laboratory required the replacement of the H^- source with a higher current source. A magnetron ion source of Fermi National Accelerator Laboratory (FNAL) design was adapted with a grooved cathode to provide a stable 40-50 mA of beam operating at 30 Hz for up to a 90 μs pulse duration. Problems of space charge blowup due to the lack of neutralization and the H^- beam were solved by injecting additional gas into the 20 keV transport system. The source has recently been installed in the machine and the available input to the accelerator has more than doubled. (6 refs.)

100033 Tests for pulsed high current heavy ion synchrotron injection with an MP-tandem Van de Graaff. P.Thieberger, M.McKeown, H.E.Wegner (Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2746-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The new MARK VII high current negative heavy ion source designed by R. Middleton (1980) was operated in a pulsed mode to provide 100-200 μa negative ion currents in 230 μsec square pulses, 10/sec. These pulses, 50-100 times more intense than normal DC beams, were then accelerated by the MP7 Tandem Van de Graaff accelerator while operating at 14 MV. After charge state analysis, the emittance of the pulsed beam was also measured. The very stable accelerator behavior indicated that even higher currents are possible. Values for ^{16}O are: 115 μa ^{16}O-injected, 100 MeV $^{16}O^{6+}$, 260 μa (43.3 pμa) 1.8 mm.mr; and for ^{32}S are: 170 μa $^{32}S^-$ injected, 140 MeV $^{32}S^{9+}$, 240 μa (26.7 pμa) 0.51 mm.mr. The high intensity and low emittance of these ion beams make them ideal for injection into a synchrotron like the AGS 30 GeV proton accelerator at BNL. (6 refs.)

100034 Millimeter high power sources for high gradient accelerators. D.Prosnitz (Lawrence Livermore Nat. Lab., Livermore, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2754-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The potential for achieving high accelerator gradients with high power RF sources is evaluated. (18 refs.)

100035 The application of magnetic switches as pulse sources for induction linacs. D.Birx, E.Cook, S.Hawkins, S.Poor, L.Reginato, J.Schmidt, M.Smith (Lawrence Livermore Nat. Lab., Livermore, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2763-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Future accelerator requirements of the Particle Beam Program for increased repetition rates and reliability led to the investigation of alternative switching schemes of pulse compression using saturable inductors. This technique has been in use for several decades, but at relatively low power levels and long pulses. Recent developments in amorphous magnetic materials has eased the challenging problem of generating 250 kV pulses for 50 ns at power levels exceeding 20 GW with fast risetime and good efficiency. The timing simultaneity required in linacs from many such parallel systems was achieved with a high degree of voltage regulation and timing feed-forward techniques. The application of magnetic switching has not only exceeded the rep-rate and jitter requirements for short bursts of pulses, but has provided excellent reliability making them applicable for a variety of other high-average power applications besides the Particle Beam Program. (no refs.)

100036 Operation of the Tevatron six-kilometer-long transfer line. C.H.Rode, R.Ferry, T.Lincicome, J.Makara, J.Theilacker, R.Walker (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2769-71 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The Tevatron transfer line consists of twenty-six 250 meter sections interconnected with vacuum jacketed U-tubes forming a loop. Each section contains a 4.50 cm i.d. super-critical helium line and a subcooled liquid nitrogen shield with an expansion joint in the middle of the run. (3 refs.)

100037 Pulsed power supply system for the fast quadrupoles in the AGS. R.J.Nawrocky, R.F.Lambiase (Brookhaven Nat. Lab., Associated Univ. Inc., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2772-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
In the acceleration of polarized protons in the AGS, a number of depolarizing resonances will be encountered. Depolarization due to the so-called intrinsic resonances will be minimized by crossing each resonance in less than one beam revolution period ($\sim$2 μs). This will be accomplished with a set of twelve 'fast' tune-shifting quadrupoles distributed symmetrically around the ring. During a typical acceleration cycle, the fast quads will be energized with a burst of alternating polarity, fast rise/slow fall triangular current pulses. The amplitude of these pulses will vary from 160 A to about 2700 A peak. The authors describe the development of the pulsed power supply for the fast quads, the construction of a prototype modulator and some of the initial test results obtained with the prototype. (2 refs.)

100038 Beam transport and targetry in the 1-TeV Fermilab meson area. E.Malamud, D.C.Carey, R.Coleman, D.Eartly, H.Haggerty, A.Jonckheere (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2775-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Three ED/S 1 TeV primary beams will be transported to the meson area and targeted in above-ground stations designed for intensities up to 5×10^{12} protons/pulse. Muon backgrounds will be reduced to acceptable levels with active shielding. New secondary beams, one providing polarized protons, the other high intensity hadrons, will feed experiments located in new buildings approximately 300 m north of the present Meson Detector Building (MDB). (5 refs.)

100039 Antiproton production and collection for the CERN antiproton accumulator. E.Jones, S.Van der Meer, F.Rohner, J.C.Schnuriger, T.R.Sherwood (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2778-80 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Antiprotons are produced for the CERN antiproton accumulator (AA) by focusing 26 GeV/c protons onto a 3 mm diameter, 11 cm long copper wire. Negatively charged particles with momenta about 3.5 GeV/c are focused by a short focal length coaxial horn and transported to the AA by a normal quadrupole focusing channel. The yield of antiprotons was found to be considerably less than anticipated (factor about 2) and the reason is presumed to be the assumption of too large a production cross-section in the original machine design proposal. Studies involving new horn design, introduction of an axial current ($\simeq$ 150 kA) along the target and use of lithium lenses as an alternative to the magnetic horn are under way. Some preliminary measurements involving some of these techniques have been made, both to confirm the validity of calculations and to test the feasibility of building targets and focusing systems to withstand the mechanical forces and heat load due to the proton beam and the high pulsed currents. (15 refs.)

100040 A design for antiproton collection and beam transport in the Fermilab Tevatron I project. E.Colton (Argonne Nat. Lab., Evanston, IL, USA), C.Hojvat.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2784-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
120 GeV protons from the Main Ring will be used to produce 8 GeV antiprotons. A pulsed lithium lens collects and matches the antiprotons to a beam line for injection into the Debuncher Ring. The $\bar{p}$ beam has a transverse emittance of 20π mm-mr and a $\delta p/p = \pm 2.0\%$. The beam line consists of a clean-up section with vertical emittance selection, two long dispersion free sections, a bend and a vertical injector. Antiproton with a transverse emittance of 2π mm-mr and $\delta p/p = \pm 7.0\times10^{-4}$ are transported in the reverse direction, bypassing the target area, and along the 120 GeV proton transport line for reverse injection in the Main ring. (4 refs.)

100041 Charge exchange injection at the AGS. D.S.Barton, L.A.Ahrens, E.Gill, J.W.Glenn, R.K.Reece, R.L.Witkover (Brookhaven Nat. Lab., Associated Univ. Inc., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2787-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The AGS was brought into operation in October 1982 with multi-turn H^- charge exchange injection. The injection area of the AGS has been modified to bring the H^- beam from the 200 MeV linac through the main magnet fringe field to a stripping foil located within the magnet aperture. The injection system is described in detail and initial performance of the accelerator is reported. (9 refs.)

100042 Evaluation and minimization of aberrations for a solenoid lens. D.D.Armstrong, J.D.Schneider (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2793-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Relativistically correct computer simulations of transporting a beam of charged particles through a solenoid lens were used to study nonlinear focusing effects of this lens type. Input beams with both zero and nonzero emittance can be studied. The magnetic field is specified either by a Fourier-Bessel function-type expansion of the vector potential at a suitably chosen radius or by a direct interpolation of the fields calculated by the magnet design code POISSON. As an area in phase space, the dependence on nonlinear effects on field strength and beam radius was determined for a few magnetic field distributions. Attempts to tailor the field to minimize spherical aberrations are discussed. (no refs.)

100043 Laser photoionization of H^0 beams for charge-changing injection. B.Blind, A.J.Jason (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2795-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The two-step charge-changing injection used in the Los Alamos Proton Storage Ring (PSR) requires stripping of H^- to H^0 by high magnetic fields and subsequent stripping of H^0 to H^+ by a carbon foil. The authors consider single- and multiphoton laser ionization as alternatives to using a fragile foil. The multiphoton case is of possible interest for selection of practical lasers, which tend to have increased power output at higher wavelengths. The formulas derived express the necessary laser powers for ionization of monoenergetic H^0 beams; they also hold for beams of particles other than atomic hydrogen. The numerical examples given are for the 800-MeV PSR beam with momentum spread taken into account. Additionally, they discuss selective stripping as an implication of the inherent energy selectivity of the photoionization process. (5 refs.)

100044 Bunching system for the Stony Brook tandem linac heavy-ion accelerator. J.M.Brennan, C.E.Chen, J.W.Noe, P.Paul, G.D.Sprouse, A.Scholldorf (Phys. Dept., State Univ. of New York, Stony Brook, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2798-800 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A versatile high-efficiency bunching system which is used to couple the Stony Brook 9 MV tandem Van de Graaff to the recently completed superconducting heavy-ion LINAC is described. The major elements of the system are: a pre-tandem double-drift harmonic buncher working at 9.4 and 18.8 MHz, a post-tandem sine-wave beam chopper at 4.7 MHz, a pre-LINAC superconducting double-drift harmonic buncher at 150 and 300 MHz and a high voltage DC-coupled single pulse selecting beam switch. (5 refs.)

100045 Graphite targets at LAMPF. R.D.Brown, D.L.Grisham (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2801-3 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Rotating polycrystalline and stationary pyrolytic graphite target designs for the LAMPF experimental area are described. Examples of finite element calculations of temperatures and stresses are presented. Some results of a metallographic investigation of irradiated pyrolytic graphite target plates are included, together with a brief description of high temperature bearings for the rotating targets. (4 refs.)

100046 The design of periodic beam transport systems. J.A.Farrell (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2804-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Periodic beam-transport systems have several advantages including insensitivity to errors, minimum magnet apertures, and use of standardized components. A simple procedure is given for the design of modules, with and without bending magnets, that have the same matched beam properties. These modules can be combined in certain ways to produce systems that are achromatic and require a minimum number of matching elements. (6 refs.)

100047 Design of the NSCL coupling line. L.H.Harwood, J.A.Nolen, R.F.Resmini, H.G.Blosser (Cyclotron Lab., Michigan State Univ., East Lansing, MI, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2806-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The K500 and K800 cyclotrons at the National Superconducting Cyclotron Laboratory must be joined by a beamline which matches the emittance of the K500 to the acceptance of the K800. The paper describes the optical design of that beamline, with particular emphasis on the conceptual design process. Specific optical constraints are given along with the techniques used for meeting them. Beam diagnostics are also discussed. All magnets will be superconducting. (3 refs.)

100048 The Fermilab Tevatron I project target station for antiproton production. C.Hojvat, G.Biallas, R.Hanson, J.Heim, F.Lange (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2815-17 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Production of 8 GeV antiprotons in the Fermilab Tevatron I project will utilize 120 GeV protons from the main ring. The target station consists of an entrance collimator, the target itself, a pulsed lithium lens for $\bar{p}$ collection, a pulsed magnet for the separation of the 8 GeV secondaries, and a beam dump. These components are mounted on vertical modules within the target service building. Allowance has been made for future improvements to increase the collected $\bar{p}$ flux. The design of the target station and its components is discussed. (8 refs.)

100049 120-GeV proton transport for antiproton production in the Fermilab Tevatron I project. E.Colton (Argonne Nat. Lab., Evanston, IL, USA), C.Hojvat, L.Oleksiuk.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2818-20 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Short bunches of 120 GeV protons will be used for the production of 8 GeV antiprotons. Protons will be extracted vertically from the Main Ring using two high field Lambertson type magnets at location F17. The beam transport is made of three sections: horizontal dispersion cancellation, vertical dispersion cancellation and final focusing. The final focusing section is composed of two quadrupole doublets and allows for variation in β^* values at the target from 1.5 m to 20.0 m. (3 refs.)

100050 Low momentum kaon beam lines. D.E.Lobb (Phys. Dept., Univ. of Victoria, Victora, BC, Canada).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2827-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Current low momentum ($\gtrsim$500 MeV/c) high acceptance ($\gtrsim$5 msr) kaon beam lines feature high ratios of charged contaminant particles to kaons. The results of computer calculations on scattering and pion production from K_S^0 decay are presented to indicate some of the sources of this contamination. Criteria for the design of beam lines are discussed and a new beam line design is proposed. (17 refs.)

100051 An RF separator for cloud muons at TRIUMF. J.A.Macdonald, E.W.Blackmore, D.A.Bryman, J.Doornbos, K.L.Erdman, R.M.Pearce, R.L.Poirier, J.-M.Putissou, J.Spuller (TRIUMF, Vancouver, BC, Canada).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2833-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A particle separator utilizing a magnetic field crossed with an RF electric field has been built and incorporated into the M9 secondary channel to produce a clean negative muon beam at 77 MeV/c $\pm$5%. The separator is driven at the main cyclotron frequency (23 MHz) and phase locked to the primary proton beam. Separation is achieved by using both the temporal and velocity differences between the muons, produced near the production target (cloud muons), and both the pion and electron contaminants in the beam. (2 refs.)

100052 Lambertson magnetic design for the Tevatron extraction channel. M.P.May, M.A.Harrison (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2836-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The beam splitting requirements of the Tevatron extraction system necessitated the design of two different high field (11 kG and 15 kG) magnetic septa. The authors present details of the magnet design with emphasis of the construction techniques used to achieve good vacuum behaviour and septum straightness while maintaining magnetic field quality. (1 ref.)

100053 A nonlinear lens system to smooth the intensity distribution of a Guassian beam. P.F.Meads,Jr..
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2838-40 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The intensity distribution of a typical ion beam is quite nonuniform with a bright center and a diffuse edge; in many cases, the actual distribution is adequately approximated by a Gaussian distribution. However, many uses for such beams require uniform illumination from the center of the target to its edges. It is shown that a system of controlled third-order aberrations produced by a pair of octupole magnets is able to substantially smooth the intensity distribution by spreading the center and folding in the edges of the beam such as the intensity is nearly uniform over the entire target. (3 refs.)

100054 Recent developments of beam dumps and targets at the SPS. R.Bellone, A.Ijspeert, P.Sievers (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2841-3 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Proton intensities of about three times the original design value of 10^{13} protons/pulse (ppp) have recently been achieved in the CERN-SPS. Failures due to the resulting elevated energy deposition densities in targets and absorbers are reported and the design and construction of new, fail safe equipment is described. (7 refs.)

100055 Electrode shaping for ion and electron extractors. J.D.Schneider, D.D.Armstrong (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2844-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A technique has been developed that defines the shapes of electrodes needed to produce a good-quality cylindrically symmetric beam of ions or electrons. This work was motivated by the need to opitmize electrode shapes for a high-brightness, low-energy, deuteron injector. The authors' experience had indicated that correct shaping of electrodes becomes increasingly important as beam perveance increases. This provided the motivation for developing a computer program that could specify electrodes producing optimum or improved beam quality. Several techniques have been developed and evaluated. The procedure described has been very successful in meeting design goals. (3 refs.)

100056 Long ceramic beam tubes for accelerator magnets. E.B.Tilles, G.H.Biallas, M.A.Harrison, P.A.Adderley, M.P.May (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2847-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The ceramic beam tubes for the fast kickers, abort kickers, bucker and pinger magnets used at Fermilab must meet a number of rather exacting requirements. The tube must be long and sufficiently straight so as not to limit magnet design, with wall strength capable of withstanding the atmospheric and mechanical forces encountered during construction and operation. Vacuum tight ceramic to stainless steel transitions must be of reasonable cost, be able to withstand high temperature processing and remain vacuum tight to the 10^{-9} Torr range. In order to remove the possibility of static charge build up, each tube has a surface coating of indium oxide applied to the inner wall. This thin coating is difficult to achieve, requiring the most careful attention to detail. Indium oxide in the In_2O_3 form is used. The methods used at Fermilab to achieve these goals are presented in the paper. (5 refs.)

100057 An energy independent electron spin precessor. B.E.Norum, R.C.York (Dept. of Phys., Univ. of Virginia, Charlottesville, VA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2921-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Discusses the production of a polarised electron beam from a circular accelerator. An energy-independent electron spin processor device is described. (5 refs.)

100058 Pulsed air-core deflector-magnet design parameters. A.J.Jason, R.K.Cooper, A.D.Liebman, B.Blind, A.R.Koelle (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2938-40 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The response of air-core magnets to pulsed excitation is dependent on the pulse frequency spectrum because of fields produced by induced currents in the magnet structure. The authors discuss this phenomenon quantitatively in terms of magnet performance optimization. (2 refs.)

100059 The Los Alamos Proton Storage Ring (PSR) injection deflector system. A.J.Jason, E.F.Higgins, A.R.Koelle (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2941-3 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Describes a pulsed magnetic deflector system planned for the injection system of the PSR. Two sets of magnets, appropriately placed in the optical systems of both the ring and the injection transport line, provide control of the rate at which particles are injected into a given portion of transverse phase space and limit the interaction of stored beam with the injection stripping foil. High-current modulators that produce relatively complex waveforms are required for this purpose. Solid-state drivers using direct feedback to produce the necessary waveforms are discussed as replacements for the more conventional high-voltage tube technology. (3 refs.)

100060 Injected beam chopper system for the Intense Pulsed Neutron Source accelerator system. A.Rauchas, R.Zolecki (Argonne Nat. Lab., Argonne, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A new chopper system has been designed and built to allow versatile manipulation of the H^- beam for the Intense Pulsed Neutron Source accelerator system. The beam is chopped at an energy of 750 keV, just before injection into the 50 MeV linear accelerator. The system consists of a high speed logic control system, a high power pulse amplifier and a travelling wave beam deflection electrode. The control system allows for up to four concurrently operable functions. The first mode is dedicated to personnel and equipment protection interlocking. The second is for low frequency pulse shaping. The third is a high frequency chop mode for RF synchronized injection of the 50 MeV beam into the Rapid Cycling Synchrotron. The fourth mode allows width and/or time modulation of the RF synchronized chopping to control the loading of the RF bucket area in the RCS. (4 refs.)

100061 Bending magnets for the CBA beam transport line. R.E.Thern (Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2950-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The beam transport line from the AGS to CBA requires 68 large bending magnets, consisting of pure dipoles and two types of combined function gradient magnets. All three types were designed with the magnetic field calculation program POISSON, using the same exterior dimensions and coil package. The design goal of ±1% momentum acceptance for the transport line required a wide horizontal aperture, with a much smaller vertical aperture for economy. Two prototypes of one gradient magnet were built, and a facility constructed to measure them and the later production magnets. Measurements were done using both a long coil and a point coil (Rawson-Lush gaussmeter). Preliminary results show $\Delta B/B<0.2\times10^{-3}$, $\Delta G/G<0.3\times10^{-2}$, and $\Delta B_2/B<0.3\times10^{-4}$ cm^{-2} over the beam aperture. Due to end effects, the actual gradient differs from the design gradient by 1%, which has been compensated for in the beam line design. (5 refs.)

100062 The Fermilab injection kicker. R.Trendler, M.Harrison, E.Tillis, C.Needles, W.Williams.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2953-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Describes the proton injection kicker system designed to accept protons from the Fermilab Conventional Main Ring in the Tevatron Superconducting Ring. The pulse forming network based thyratron switch tube pulsed delivers a 100 ns rise, 200 ns fall, 40 kV pulse to a 6.25 ohm traveling wave magnet load. The pulse duration adjustable up to a maximum of ~22 μsec. The design philosophy, magnet parameters, and system performance are discussed. (no refs.)

100063 The AGS new fast extraction system and the single bunch extraction test. W.T.Weng (Brookhaven Nat. Lab., Associated Univ. Inc., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2956-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
For the neutrino physics program and for the CBA injection, a new fast extraction system has been implemented to improve the extraction efficiency and the quality of the extracted beam. Central to the new system is a new fast kicker, placed at the H5 straight section, capable of rising between bunches, $t_r<170$ nsec, and staying constant for 2.6 μsec with flat top ripple less than ±1.5%. So far, the system has been operated for longer than 3000 hours and routinely extracts 10^{13} ppp at 99% efficiency. Experiment 745 on QCD test requires a single AGS bunch of 40 nsec. For this purpose another fast kicker was placed at the E5 straight section and powered by a new pulser to produce a half sinusoidal pulse with both a rise and fall time of 200 nsec. A single AGS bunch was extracted through the slow beam channel at 22 GeV/c leaving the remaining 11 bunches undisturbed which continued to be accelerated to 29.4 GeV/c and extracted by the H5 kicker through the fast beam channel. Because the ring circumference ratio of CBA to the AGS is 4-3/4, some of the injected beam from the AGS has to contain 11 bunches instead of 12; consequently, this single bunch extraction mode will also be used for CBA injection. (5 refs.)

100064 Status of the SNS. G.H.Rees (Rutherford Appleton Lab., Chilton, England).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3044-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The current status of the SNS Project is outlined, with more emphasis on the details of the 50 Hz, 800 MeV proton synchrotron than on the high intensity neutron target. Points of interest in the synchrotron and target hardware are given. (6 refs.)

100065 Inertial fusion with low energy heavy ions. A.W.Maschke (Brookhaven Nat. Lab., Associated Univs. Inc., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3055-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
High energy heavy ions have been under study for inertial fusion applications for some time. The author points out that it may be possible to utilize heavy ions with energies less than 1 MeV, compared with the usual HIF approach using multi-GeV beams. (11 refs.)

100066 An isochronous stacking ring approach to the HTE. F.Selph, H.Grunder, B.Leemann (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3073-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Target heating for the high temperature experiment (HTE) requires a short beam burst on the order of tens of nanoseconds with a total beam energy of a kilojoule or more. The RF linac falls far short of this capability. A number of studies have considered the use of storage rings for accumulating beam current. The authors look at an alternative means, using an RF linac followed by an isochronous stacking ring (ISR), producing rapidly the high multiplication of beam current required. This method avoids the necessity for beam manipulations such as beam splitting, RF bunching in a storage ring, etc. Because of the fast transit time in the ISR, storage ring instabilities are not a problem. (5 refs.)

100067 Undulators as sources of synchrotron radiation. S.Krinsky (Nat. Synchrotron Light Source, Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3078-82 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Wigglers and undulators are used as enhanced sources of synchrotron radiation in electron storage rings. The author discusses the properties of the radiation from these devices, and some of the considerations which arise in their design and use in storage rings. The main emphasis is on undulators. (16 refs.)

100068 High energy gamma ray beams from Compton backscattered laser light. A.M.Sandorfi, M.J.LeVine, C.E.Thorn, G.Giordano, G.Matone, C.Schaerf (Phys. Dept., Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3083-7 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Collisions of light photons with relativistic electrons have previously been used to produce polarized γ-ray beams with modest ($\sim 10\%$) resolution but relatively low intensity. In contrast, the LEGS project (laser+electron gamma source) at Brookhaven will produce a very high flux ($>2\times10^{7}\ s^{-1}$) of background-free polarized γ-rays whose energy will be determined to a high accuracy ($\Delta E=2.3$ MeV). Initially, 300(420) MeV γ-rays will be produced by backscattering UV light from the new 2.5(3.0) GeV X-ray storage ring of the National Synchrotron Light Source (NSLS). The LEGS facility will operate as one of many passive users of the NSLS. In a later stage of the project, a free electron laser is expected to extend the γ-ray energy up to 700 MeV. (7 refs.)

100069 Anomalous laser induced bunch lengthening on the ACO storage ring free electron laser. K.E.Robinson (High Energy Phys. Lab., Stanford Univ., Stanford, CA, USA), J.M.J.Madey, M.F.Velghe, D.A.G.Deacon.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3088-90 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Laser induced bunch lengthening has been measured on the ACO storage ring free electron laser (SRFEL) in the anomalous bunch lengthening regime. The experimental results show correlations between the appearance of coherent modes in the electron bunch and anomalous behavior in the presence of the laser. Simultaneous time resolved laser induced bunch lengthening, mode strength, bunch length, and synchrotron sideband measurements were made as anomalous thresholds were traversed several times by changing the RF accelerating voltage. Bunch shortening, multiple time constants, and oscillatory behavior are among the phenomena which have been observed. (5 refs.)

100070 An all wiggler and undulator synchrotron radiation source. H.Winick, H.Wiedemann, I.Lindau, K.Hodgson (Stanford Synchrotron Radiation Lab., Stanford, CA, USA), K.Halbach, J.Cerino, A.Bienenstock, R.Bachrach.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3097-9 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Successful experience with wiggler and undulator (w/u) magnets as synchrotron radiation (SR) sources has led to new facility design concepts. The authors review the design features and performance criteria of new rings and describe a proposed facility at SLAC consisting of two rings (1-2 and 5-6 GeV) in the same tunnel, both optimized for w/u insertions. The authors also present conceptual designs for permanent magnet dipoles and quads. (9 refs.)

100071 The Advanced Light Source. R.C.Sah (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3100-2 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The Advanced Light Source (ALS) is a new synchrotron radiation source which has been proposed by Lawrence Berkeley Laboratory. The ALS will be a key component in a major new research facility, the National Center for Advanced Materials. The ALS will consist of an electron linear accelerator, a 'booster' synchrotron, a 1.3-GeV electron storage ring, and a number of photon beam lines. Most or all photon beam lines will originate from wiggler and undulator magnets placed in the 12 long straight sections of the ALS. A very low electron beam emittance will provide photon beams of unsurpassed spectral brilliance from specially-designed undulators, and a high radiofrequency will produce very short pulse lengths. (1 ref.)

100072 Closed orbit correction of the NSLS VUV ring. E.Bozoki, J.Bittner, L.Blumberg, T.Dickinson, J.Galayda (Nat. Synchrotron Light Source, Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3106-8 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The authors describe the results obtained from the orbit correction system in the NSLS VUV storage ring which consists of 24 PUE stations and 16 horizontal and vertical correction dipoles. The data were obtained by the PUEREAL module of the RING control program which provides automatic switching of the signal from individual electrodes of the PUE stations and provides a readout at harmonic of the RF frequency. The closed orbit is then calculated and corrected by measured displacements of the PUEs from the adjacent quadrupoles. The ORBIT module of the RING program was used to minimize the RMS orbit deviations choosing the most effective correctors and calculating their strengths. For the horizontal case, the correction was accomplished using 3 correctors in two iterations starting with RMS values $X=2.9$ mm to $X=0.9$ mm. Vertically three iterations and 6 correctors were required to correct the RMS value from $Z=6.8$ mm to $Z=0.8$ mm. (6 refs.)

100073 Amplifier optimization study for an FEL wiggler with a helical magnetic field and an axial electric field. H.Takeda, S.B.Segall (KMS Fusion Inc., Ann Arbor, MI, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3112-14 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A one-dimensional multiparticle free electron laser (FEL) amplifier simulation code based on a single particle interaction model is used to determine laser gain and energy spread in an FEL amplifier in which gain is enhanced by means of an axial electric field. Limitations on achievable laser intensity due to limits on the energy spread an energy recovery system can accept are discussed and a comparison is made with tapered wiggler systems. (3 refs.)

100074 The beam line VI rec-steel hybrid wiggler for SSRL. E.Hoyer, T.Chan, J.W.G.Chin, K.Halbach, K.J.Kim (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA), H.Winick, J.Yang.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3118-20 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A wiggler magnet with 27 periods, each 7 cm long which reaches 1.21 T at a 1.2 cm gap and 1.64 T at 0.8 cm gap has been designed and is in fabrication. Installation in SPEAR is scheduled for mid 1983. This new wiggler will be the radiation source for a new high intensity synchrotron radiation beam line at SSRL. The magnet utilizes rare-earth cobalt (REC) material and steel in a hybrid configuration to achieve simultaneously a high magnetic field with a short period. The magnet is external to a thin walled variable gap stainless steel vacuum chamber which is opened to provide beam aperture of 1.8 cm gap at injection and then closed to a smaller aperture (<1.0 cm). Five independent drive systems are provided to adjust the magnet and chamber gaps and alignment. Magnetic design, construction details and magnetic measurements are presented. (9 refs.)

100075 Free electron laser for a mildly relativistic electron beam. H.S.Uhm (Naval Surface Weapons Center, Silver Spring, MD, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3121-3 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The bandwidth and frequency enhancement of the free electron laser instability in a mildly relativistic ($\gamma\lesssim1.15$) electron beam propagating through a dielectric loaded waveguide is presented. For an appropriate choice of the dielectric constant $\hat{\epsilon}$ and the thickness of the dielectric material, it is shown that the instability bandwidth and frequency can be greatly enhanced for specified values of the beam energy and the wiggler wavelength. (7 refs.)

100076 SRS behaviour with a superconducting 5-Tesla wiggler insertion. V.P.Suller, N.Marks, M.W.Poole, R.P.Walker (Sci. Engng. Res. Council, Daresbury Lab., Daresbury, England).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3127-9 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A 5 Tesla superconducting wavelength shifting wiggler magnet has been inserted into the SRS lattice. Observations have been made of the behaviour of the stored electron beam with the magnet powered. Betatron tune shifts and modulation of the betatron function have been measured and good agreement obtained with theory. Closed orbit changes have been examined and the stored beam lifetime optimised. The magnet is fully operational and is producing intense X-ray beams for users. (3 refs.)

100077 Laser accelerators. A.M.Sessler (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3145-9 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Laser accelerators may be conveniently characterized, by their mode of operation, into media, far-field, and near-field accelerators. The first category—media accelerators—include the Inverse Cherenkov Effect Accelerator, the Plasma Focus Accelerator, and the Beat Wave Accelerator (BWA). The second category—far-field accelerators—include the Two-Wave Device and the Inverse Free Electron Accelerator (IFEL). The third category—near-field accelerators—includes conventional linacs scaled to small dimensions, dielectric sheets, small holes in dielectric cylinders, and gratings. Attention is devoted to an example from each category; namely (1) the BWA, (2) the IFEL, and (3) the linac scaled to small dimensions (about 30 GHz) and powered by a free electron laser (FEL). Finally, special attention is given to grating accelerators. (12 refs.)

100078 Intense electron beam autogenerator. M.G.Mazarakis, S.L.Shope, D.L.Smith, R.B.Miller (Sandia Nat. Labs., Albuquerque, NM, USA), R.J.Adler.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3171-3 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A novel autogeneration mechanism was conceived and used to generate and accelerate an intense relativistic electron beam. This was accomplished via the passage of a primary relativistic electron beam pulse through an uncharged pulse forming transmission line cavity. A second beam pulse was generated with the same duration as the primary beam, e.g., 10-20 nsec, but delayed by a time interval equal to the double transit time of the induced electromagnetic wave inside the cavity. (8 refs.)

100079 SRA: a new ion accelerator scheme. J.Y.Choe, H.S.Uhm (Naval Surface Weapons Center, White Oak, Silver Spring, MD, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3174-6 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The space-charge resonance accelerator (SRA) consists of a relativistic electron beam propagating through a dielectric loaded drift tube. In a range of physical parameters, the phase velocity of a self-growing space-charge wave increases slowly from zero to a large beam velocity as it propagates into the downstream region, thereby trapping and accelerating ions by its electric field. The self-growing mechanism of the space-charge wave is typical Cherenkov radiation. (9 refs.)

100080 Studies of the helix controlled beam front accelerator concept. W.W.Destler, P.G.O'Shea, M.Reiser, C.D.Striffler, D.Welsh, H.H.Fleischmann (Electrical Engng. & Phys. Dept., Univ. of Maryland, College Park, MD, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3183-5 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Helix controlled collective ion acceleration involves the use of a helical slow wave structure to control the propagation velocity of an intense relativistic electron beam front, in which ions could be trapped and accelerated to high energy. Experimental and theoretical studies of the propagation of an IREB inside both cylindrical and helical conducting boundary systems have been conducted. In the experiments, an IREB (1 MeV, 30 kA, 30 ns, confined by an applied axial magnetic field) is injected from a 1 cm diameter hollow stainless steel cathode through a 2.4 cm diameter hole in a stainless steel anode into either cylindrical or helical downstream drift chambers. Beam propagation in the cylindrical systems is in good qualitative agreement with theoretical calculations based on a modified Bogdankevich, Rukhadze beam model. When a helical slow wave structure is used as the conducting boundary, the beam front velocity is significantly reduced to values approaching those associated with the helix pitch angle. (3 refs.)

100081 Collective acceleration of laser produced ions. J.T.Cremer, W.W.Destler (Electrical Engng. Dept., Univ. of Maryland, College Park, MD, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3186-8 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Experimental studies of the collective acceleration of laser produced ions have been conducted. An intense relativistic electron beam (1 MeV, 30 kA, 30 ns) is emitted from a 4 mm diameter tungsten cathode and passes through a 2.4 cm hole in a stainless steel anode into a 14 cm diameter downstream drift tube. Ions are provided on the downstream side of the anode plane by firing a 4-10 J, 15 ns Q-switched ruby laser pulse at solid or foil targets mounted on the downstream side of the anode plane. Accelerated ion energies are measured using time of flight and range energy/track etching techniques. Ion charge states are measured using an E$\|$B Thomson spectrometer. Results will be compared with measurements of the pre-acceleration characteristics of the laser produced ions from these target geometries obtained using an electrostatic analyzer. (14 refs.)

100082 The IFA-2 collective ion accelerator system. C.L.Olson, C.A.Frost, E.L.Patterson, J.W.Poukey (Sandia Nat. Labs., Albuquerque, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3189-91 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A second generation ionization front accelerator system (IFA-2) is being brought into operation. Results of IFA-2 IREB optimization experiments, laser characterization experiments, beam switch experiments, and laser deflector experiments are presented. The status of the IFA-2 system is summarized. (9 refs.)

100083 Compact pulsed accelerator. M.J.Rhee, R.F.Schneider (Lab. for Plasma & Fusion Energy Studies, Univ. of Maryland, College Park, MD, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3192-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The formation of fast pulses from a current charged transmission line and opening switch is described. By employing a plasma focus as an opening switch and diode in the prototype device, a proton beam of peak energy 250 keV is produced. The time integrated energy spectrum of the beam is constructed from a Thomson spectrograph. Applications of this device as an inexpensive and portable charged particle accelerator are discussed. (7 refs.)

100084 Alternate transport techniques for electron induction linacs. R.J.Adler, B.Sabol, G.F.Kiuttu (Mission Res. Corp., Albuquerque, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3198-200 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Recently, there has been a great deal of interest in producing intense, high energy electron beams in induction linear accelerators. These machines will have applications in radiation effects studies, intense neutron pulse production, free electron lasers, Tokamak current drive, betatron injection, and plasma heating. Most of the induction accelerators built to date have used solenoidal focusing to confine and transport the beam. The authors present various alternate transport techniques. (21 refs.)

100085 Transverse particle acceleration techniques using lasers and masers. N.C.Schoen (TRW Systems, Redondo Beach, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3206-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A preliminary investigation of a concept for accelerating electrons using traveling electromagnetic waves in a vacuum environment has been presented. Energy levels of the order of 100 MeV can be attained in distances of the order of several Rayleigh lengths, although practical limitations on source size and extraction devices will limit figures of merit to the order of 100 MeV/m. The primary challenge to designing high power devices will be to devise ways to increase the volume of the acceleration region and/or the repetition rate of the device so as to increase the output current. More accurate models for the time history of electric and magnetic field vectors in the focal region are also needed to determine more carefully the limits on the electron injection process. Nonetheless, the simplicity of the acceleration process should provide the impetus for the development of these devices. (8 refs.)

100086 High field superconducting magnets for particle accelerators. H.Hirabayashi (KEK Nat. Lab. for High Energy Phys., Ibaraki, Japan).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3304-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983)
Based on an extensive study of NbTi/Cu dipoles cooled with 1.8K pressurized helium II and Nb_3Sn/Cu racetrack dipoles at 4.2K, the merit and demerit of these two kinds of magnets are discussed from the viewpoint of practical applications in future accelerators. There are many thermal, mechanical and electromagnetic difficulties in designing high field accelerator magnets in the 10 T region. The author's experience with NbTi/Cu and Nb_3Sn/Cu dipole magnets is reported and possible designs for high field magnets are presented, based on results of detailed calculations. (13 refs.)

100087 Superconducting cavities for high energy accelerators—progress and prospects. M.Tigner (Cornell Univ., Ithaca, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3309-12 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Real progress in applications of radio frequency superconductivity to high energy electron storage rings has been registered recently. It is clear now that this technology will make a significant contribution to the advancement of particle physics in the 10's to 100's of GeV-CM energy range. This progress and its foundation are reviewed briefly. While considerable work remains in consolidating present accomplishments into reliable engineering technology, long lead times for significant technological developments make it appropriate to inquire now about the future prospects for this technology. Does this technology have a potential for being useful in a generation of accelerators that can take us into the TeV domain? This question and its associated R/D questions are addressed. (16 refs.)

100088 Development of the different REQ accelerating structures and operation experience. H.Klein (Inst. fur Angewandte Phys., Univ. Frankfurt am Main, Frankfurt am Main, Germany).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3313-22 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Fourteen years after the invention of the 'spatially continuous strong focusing' principle in the USSR and five years after the start of the RFQ research program in the USA numerous (~15) laboratories all over the world are concerned with this new accelerator concept and many projects are under way. A brief review of these activities and the considered applications is given and the different approaches in beam dynamics, electrode configuration and resonators are outlined. (54 refs.)

100089 Permanent multipole magnets with adjustable strength. K.Halbach (Lawrence Berkeley Lab., Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3323-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Preceded by a short discussion of the motives for using permanent magnets in accelerators, a new type of permanent magnet for use in accelerators is presented. The basic design and most important properties of a quadrupole will be described that uses both steel and permanent magnet material. The field gradient produced by this magnet can be adjusted without changing any other aspect of the field produced by this quadrupole. The generalization of this concept to produce other multipole fields, or combination of multipole fields, is also presented. (5 refs.)

100090 Adjustable strength REC quadrupoles. R.L.Gluckstern (Dept. of Phys., Univ. of Maryland, College Park, MD, USA), R.F.Holsinger.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3326-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The development of high field rare earth cobalt (REC) permanent magnet materials has led to the development of rings which produce high field, high quality quadrupoles used primarily to focus charged particle beams. The authors obtain an expansion of all matrix elements up to and including terms of second order in the magnet strength. These results suggest a non-uniform choice of disk thicknesses which leads to a particularly simple prescription for the rotations. The accuracy of these suggestions is then confirmed by numerical computations, including the effects of known fringing fields from an REC ring. They conclude, that fringing fields have almost no influence on the prescription of rotation angles which eliminates coupling between the two transverse fields, nor do they affect the focal strength of the total configurations in lowest order. The primary effect of the fringing fields will be shown to be a shift in the principal planes, as is the case for single quadrupole rings. (3 refs.)

100091 Long term stability of Fermilab Energy Saver magnets. W.E.Cooper, B.C.Brown, R.W.Hanft, E.E.Schmidt (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3330-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The quench and field properties of Energy Saver dipole and quadrupole magnets are measured at the Fermilab Magnet Test Facility shortly after the magnets have been produced. It is important that magnet properties remain unchanged with time. This question has been investigated by remeasuring magnets at a later time and comparing the two sets of measurements. (6 refs.)

100092 Operation of a superconducting accelerating cavity in PETRA. W.Bauer, A.Brandelik, A.Citron, F.Graf, L.Szecsi (Univ. of Karlsruhe, Karlsruhe, Germany), D.Proch.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3333-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
To investigate the feasibility of superconducting cavities in electron-positron storage rings a single cell Niobium cavity was tested in PETRA. The authors describe the experimental setup and summarizes the results obtained: Accelerating field gradients of 3 MV/m and Q-values of 10^9 are measured in an operating storage ring and maintained over many weeks. Synchrotron radiation impinging on the cavity surface did not affect the performance. Higher order modes excited by the beam were coupled out, their amplitudes agree with theory. PETRA was operated at 5 GeV and 2 mA with the superconducting cavity alone. (12 refs.)

100093 Superconducting cavity beam test in CESR. R.Sundelin, J.Amato, S.Herb, J.Kirchgessner, P.Kneisel, J.Mioduszewski, N.Mistry, K.Nakajima, H.Padamsee, F.Palmer, H.L.Phillips, M.Pickup, R.Siemann, M.Tigner, E.von Borstel (Newman Lab. of Nuclear Studies, Cornell Univ., Ithaca, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3336-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The first use of a superconducting accelerating structure in a storage ring is described. Two 5-cell 1500 MHz 'muffin tin' superconducting niobium cavities (1 m active length) were operated in the Cornell 8 GeV e^+e^- storage ring, CESR. A 6.1 mA beam was captured and stored at 3.5 GeV using only the superconducting cavity. Up to 12.5 kW was transferred to the beam by the cavity. Single bunch currents up to 12 mA were reached in conjunction with the normal 500 MHz RF. Beam induced higher order mode (HOM) powers of 290 W were carried to room-temperature loads by four couplers and waveguides; no HOM-induced cryogenic dissipation was detectable. Q's of the 76 most prominent resonances were measured. Transverse and longitudinal beam instabilities were studied by mechanically sweeping the tune of the cavities; current thresholds are compared to theory. The cavity exhibited the ability to survive breakdown at high incident power without degradation. (11 refs.)

100094 A superconducting accelerating structure for particle velocities from 0.12- to 0.23-C. K.W.Shepard, G.P.Zinkann (Argonne Nat. Lab., Argonne, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3339-41 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A split-ring resonator has been designed for an optimum particle velocity $\beta=v/c=0.16$ and a frequency of 145.5 MHz. The ratio of peak surface electric field to effective accelerating field in the resonator has been reduced 20% from the value obtained in previously developed split-ring resonators. The improved design results from the use of elliptically-sectioned loading arms and drift-tubes which have been enlarged to reduce peak surface fields and also shaped to eliminate beam steering effects in the resonator. All fabrication problems presented by the more complex geometry have been solved and a prototype superconducting niobium resonator has been completed. An accelerating field of 3.3 MV/m at 4 watts RF input has been so far achieved, corresponding to an effective accelerating potential of 1.17 MV per resonator. (3 refs.)

100095 Status report of the superconducting 5-cell acceleration structure at CERN. P.Bernard, D.Bloess, G.Cavallari, E.Chiaveri, W.Erdt, E.Haebel, H.Lengeler, P.Marchand, P.Queru, J.Tuckmantel, W.Weingarten (CERN, Geneva, Switzerland), H.Piel.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3342-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
At CERN, a 5 cell 500 MHz superconducting accelerating cavity has been constructed. At present the cavity is installed in the PETRA storage ring at DESY for a test run which will start middle of March. The cavity is equipped with a high power coupler and with 5 higher order mode couplers, two of the loop type and three of the antenna type. Frequency tuning and regulation are achieved by varying the length of the two end-cells. In a test of the complete cavity-cryostat system at CERN, acceleration fields of 2.8 MV/m and Q_0-values above 10^9 have been reached. The cryostat losses remained below 10 W. (4 refs.)

100096 Fundamental and higher order mode couplers on superconducting RF cavities for electron storage rings. E.Haebel (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3345-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The design of a coaxial high power loop coupler for use on a 500 MHz superconducting (SC) accelerating cavity of 'spherical' shape is described.

Non-superconducting construction materials (copper and copper plated stain-ess steel) are used. Cooling is obtained by cold helium gas in counter flow. The coupler is located at the cavity equator and a choke provides an uncritical RF joint at a minimum current flow position. For the coupling required ($Q_{ext}=10^5$-10^6) the loop does not protrude into the cavity. Test experiments up to 70 kW incident RF power with a matched copper cavity and up to 17.5 kW with a superconducting cavity (corresponding to an acceleration field $E_{acc}=3.6$ MV/m) are described. Design and measurements with two types of compact higher order mode couplers, coupling to the magnetic and electric field respectively are described. Both couplers are manufactured from Nb and are low Q resonant devices with their centre-frequency matched to the relevant part of the cavities' higher order mode spectrum. All couplers have been operated with a SC cavity up to the design field level. (9 refs.)

100097 Development of superconducting cavities of cylindrical symmetry at Cornell. P.Kneisel, K.Nakajima, J.Kirchgessner, J.Mioduszewski, M.Pickup, R.Sundelin, M.Tigner (Floyd R. Newman Lab., Cornell Univ., Ithaca, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3348-50 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The fabrication, processing and measurement of five single cell and one 5-cell L-band niobium cavities of elliptical shape are discussed. Q-values of 2 to 5×10^9 have typically been obtained without high temperature firing. In single cells magnetic surface fields as high as 56 mT corresponding to an accelerating field of 7 MV/m have been measured. In the 5-cell structure a gradient of 4.7 MV/m was achieved. (15 refs.)

100098 Fabrication of superconducting niobium radio frequency structures. J.Kirchgessner, J.Amato, J.Brawley, P.Kneisel, J.Mioduszewski, H.Padamsee, H.L.Phillips, R.Sundelin, M.Tigner, J.Walters (Lab. of Nuclear Studies, Cornell Univ., Ithaca, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3351-3 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
During the last several years a variety of superconducting radio frequency structures have been designed, fabricated and tested. The diverse structures and fabrication techniques will be described. For much of the work described, no claim is made as to the original conception having taken place in the laboratory. This paper is a description of the authors' experiences in this field. (5 refs.)

100099 Superconducting cavities from a niobium-copper material. H.Padamsee (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3354-6 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
For large-scale applications, such as superconducting LEP or TRISTAN, cavities made from Nb-Cu composite material offer several advantages over 100% Nb cavities—material cost reduction, defect stabilization, and cryostat simplification through pipe cooling application. Thermal model calculations presented show that if thicknesses less than 0.5 mm can be achieved for the Nb layer, surface defects can tolerate higher power levels. This improves the reliability of achieving target field levels, usually limited by thermal instabilities at defects. Calculations that model pipe cooling copper-backed Nb cavities show that even if coils are spaced as loosely as one every 10 cm, satisfactory cooling of defects can be accomplished. Nb-Cu composite material of good bond quality as well as Nb-Cu cavities have been made. In one S-band cavity, Nb-layer thickness 0.3 mm, $Q_0>2\times10^9$ and $E_{acc}>6.5$ MV/m were achieved. In this cavity 0.5 mm diameter defects operated at 4.2 MV/m whereas in 100% Nb wall cavities they break down at 3.2 MV/m. (4 refs.)

100100 Superconducting RF-cavities for a 30-GEV PETRA storage ring. W.Ebeling, W.Flauger, W.D.Moller, J.Peters, D.Proch, J.Susta (DESY, Hamburg, Germany), G.Arnolds-Mayer, H.Heinrichs, T.Grundey.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3357-9 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The installation of superconducting RF-cavities offer the possibility to increase the beam energy of the PETRA storage ring to 30 GeV. To investigate the large scale use of superconducting RF technology a prototype cryogenic module compatible with space requirements in the PETRA tunnel is developed. The cryostat has a length of 4.2 m and contains two 9 cell 1 GHz structures of elliptical shape. Rectangular and capacitive loaded circular waveguides are explored for high power input and higher mode output couplers. (12 refs.)

100101 Superconducting delay line for stochastic cooling filters. M.Kuchnir, J.D.McCarthy, R.J.Pasquinelli (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3360-2 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The stochastic cooling system of the antiproton source at Fermilab uses notch filters for reducing the feedback power at frequencies corresponding to particles in the core. At the same time these filters assist in shaping the gain vs. momentum in the stack tail. These filters, therefore, must attenuate all the harmonics of the revolution frequency (629 kHz) in the operating frequency band (1 to 2 GHz). They require components providing delays of 1.59 μsec, with a minimum of attenuation and undesirable distortion in this passband. Transmission lines providing such delays are typically 328 m long (or 164 m if used in a reflecting mode), have a rather large diameter, and are fabricated from a high conductivity material to keep the attenuation sufficiently low. The use of superconductors allows a dramatic reduction in the diameter, total size and cost of this component in spite of the added cryogenic requirements. Superconducting coaxial transmission lines are not new. N.S. Nahman (1973) concisely traced their development from his invention in 1960 to 1973. Y. Hoshiko (1975) and H. Yoshikiyo et al. (1977) described the development of such cables in Japan. While pursuing ways of manufacturing or procuring such transmission lines, the authors measured the performance of two such cables in order to demonstrate the feasibility of the superconducting cable notch filters concept. (5 refs.)

100102 Transient high-field behavior of niobium superconducting cavities. I.E.Campisi, Z.D.Farkas, H.Deruyter, H.A.Hogg (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3366-8 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Tests have been performed on the breakdown behavior of a TM_{010} mode, S-band niobium cavity at low temperatures. Unloaded Q's of 9×10^7 at 4.2K and of 7×10^9 at 1.35K were measured during several tests performed using pulses long enough for the cavity to reach steady state. The breakdown field at 1.35K was increased from 15 to 20 MV/m by processing the cavity at room temperature using 1 MW, 2.5 μs pulses. The response of the cavity at 4.2K to 1 MW, 2.5 μs pulses was also tested in several cool-downs. In these tests the cavity was heavily overcoupled to lower its time constant to a value of 0.80 times the RF pulse length of 2.5 μs. This condition maximizes the energy transfer from the klystron source to the cavity. Measurements made during these experiments clearly indicated that fields of about 50 MV/m were being reached in the cavity without breakdown. (3 refs.)

100103 Quench protection studies on CBA magnets. A.J.Stevens, J.G.Cottingham, A.Ghosh, K.Robins, W.B.Sampson (Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3369-71 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Results from quench studies on both short cable samples and prototype Colliding Beam Accelerator project magnets are presented. The quantity of paramount interest is $\int I^2dt$ which is a monotonic function of the maximum conductor temperature obtained in a quench. Conductor damage in short samples has been observed for $\int I^2dt\gtrsim8.4\times10^6$ amp^2-sec at 50 kG and 4.2K. Each magnet is equipped with spot heaters in various locations so that systematic studies of quench propagation under controlled conditions can be made. Values of $\int I^2dt$ as a function of current, location, bath temperature, and cooling mode (single phase helium versus two phase helium) are presented. The magnets are able to absorb their own energy with a modest margin of safety for the type of quenches expected in an accelerator environment. In order to obtain an additional margin of safety, a quench protection scheme which employs current shunting diodes across each magnet half has been adopted. (6 refs.)

100104 Internal trim coils for CBA superconducting magnets. P.A.Thompson, S.Aronson, J.G.Cottingham, M.Garber, H.Hahn, W.B.Sampson (Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3372-4 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
In order to correct iron saturation effects and shape the beam working line, superconducting trim coils have been constructed, which operate inside the main coils. Detailed studies of mechanical properties, quench behaviour, fields produced and hysteresis have led to the production of accelerator quality coils generating the required strength harmonics up to cos (7θ). These are routinely installed in CBA main magnets and operate at 80% of short sample with negligible training in an ambient field of more than 5.3T. (5 refs.)

100105 End fields of CBA superconducting magnets. H.G.Kirk, J.Herrera, E.Willen (Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3375-7 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Measurements of the two dimensional harmonic content of the end fields generated by the Brookhaven CBA dipole and quadrupole superconducting magnets are presented. Both the local longitudinal structure and the integrated and effects are examined. (2 refs.)

100106 Cryogenic correction coil testing. A.McInturff, M.Kuchnir, P.Mantsch (Fermi Nat. Accelerator Labs., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3378-80 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The lattice of the Fermi National Accelerator Laboratory's Energy Saver/Doubler contains a group of superconducting correction windings with each quadrupole which are housed in an element referred to as a 'spool'. There are 192 spools in the ring plus 12 special power spools which contain the main buss 5000 ampere power as well as correction elements. There will be constructed and tested 260 spools including spares of each of the eight different types. There have been 243 individual spools tested to date. During last fiscal year 188 spool tests were conducted at the test facility. The spools were tested for a) high voltage integrity, b) critical transport current, c) cryogenic heat load, d) cryogenic operating characteristics, e) thermometry calibration and at another facility, magnetic field quality. Data are summarized for 288 cryogenic tests of the 246 different spools, 488 coil sets, and 1464 correction magnets. (10 refs.)

100107 Magnetic field properties of Fermilab Energy Saver dipoles. R.Hanft, B.C.Brown, W.E.Cooper, D.A.Gross, L.Michelotti, E.E.Schmidt, F.Turkot (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3381-3 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
At Fermilab the authors have operated a production line for the fabrication of 901 21 foot long superconducting dipoles for use in the Energy Saver/Doubler. At any one time 772 of these dipoles are installed in the accelerator and 62 in beamlines; the remainder are spares. Magnetic field data are now available for most of these dipoles; in this paper we present some of these data which show that we have been able to maintain the necessary consistency in field quality throughout the production process. Specifically they report harmonic field coefficients, showing that the mechanical design permits substantial reduction of the magnitudes of the normal and skew quadrupole harmonic coefficients; field shape profiles; integral field data; and field angle data. Details of the measurement apparatus and procedures are described elsewhere. (4 refs.)

100108 Magnetic field data on Fermilab Energy Saver quadrupoles. E.E.Schmidt, B.C.Brown, W.E.Cooper, H.E.Fisk, D.A.Gross, R.Hanft, S.Ohnuma, F.T.Turkot (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3384-6 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The Fermilab Energy Saver/Doubler (Tevatron) accelerator contains 216 superconducting quadrupole magnets. Before installation in the Tevatron ring, these magnets plus an additional number of spares were extensively tested at the Fermilab Magnet Test Facility (MTF). Details on the results of the tests are presented here. (6 refs.)

100109 Maximum field capability of Energy Saver superconducting magnets. F.Turkot, W.E.Cooper, R.Hanft, A.McInturff (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3387-9 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
At an energy of 1 TeV, the superconducting cable in the Energy Saver dipole magnets will be operating at ~96% of its nominal short sample limit; the corresponding number in the quadrupole magnets is 81%. All magnets for the Saver are individually tested for maximum current capability under two modes of operation; some 900 dipoles and 275 quadrupoles have now been measured. The dipole winding is composed of four individually wound coils. In general, the cable in the four coils comes from four different reels of cable. As part of magnet fabrication quality control, a short piece of cable

from both ends of each reel has its critical current ($\rho=1\times10^{-12}\Omega$-cm) measured at 5 T and 4.3K. The authors present the statistical results of the maximum field tests on Saver magnets and explore the correlation with cable critical current. (7 refs.)

100110 Performance of 1-m long/75-mm bore superconducting prototype coils for HERA. G.Horlitz, H.Kaiser, G.Knust, K.-H.Mess, S.Wolff (DESY, Hamburg, Germany), P.Schmuser, B.H.Wiik.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3390-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Two short prototypes of the new HERA superconducting dipole magnets with 75 mm inner bore have been built and tested in a bath cryostat. Both coils have reached the short sample current of the cable after a few training steps. The quench current depends linearly on the temperature between 4.0 and 5.0K. The field quality of both coils is in general within specifications. There is no current dependence of the higher harmonics except for the well-known hysteresis due to persistent currents. (5 refs.)

100111 High field accelerator magnet design (10 T, 2 T/cm), material and model development. A.D.McInturff, W.E.Fowler, K.Ishibashi, M.Kuchnir, R.A.Lundy, A.V.Tollestrup (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3393-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Some of the options to be carefully studied and considered for the next generation particle acceleraors are those based on high field ring magnets, i.e. 8→10 T dipole and a 2 T/cm gradient quadrupole. For an intelligent accelerator design decision to be made, it is necessary to design and develop these magnets to a manufacturable prototype. Most of the dipole calculations presented here will be based on a four shell, five kiloampere/turn, five centimeter aperture magnet, approximately six meters long. The calculations, for this size dipole indicate that with presently available materials, the field quality, force containment and currents required for construction of the magnet, are possible. The main objection is the voltage needed to bring the field down without damaging the magnet after a quench (i.e. the inductance/unit length is too large). Recently the concept of a ten thousand ampere/turn design appears to alleviate the inductance problems. (6 refs.)

100112 A layer-wound, 8.7-Tesla superconducting dipole magnet. W.V.Hassenzahl, S.Caspi, W.Gilbert, C.Peters, J.Rechen, C.Taylor (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3396-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The superconducting dipole magnet (D-9B) described in this report is similar in construction to a previous model coil (D-9A) described by Hassenzahl et al. (1982). The authors discuss the features of D-9B that are different from those of D-9A and the results of tests in He I at about 4.3K and in He II between 1.8 and 2.16K. The development of D-9A and D-9B is part of a program at the Lawrence Berkeley Laboratory to establish the technology of 8 to 10 T accelerator dipoles. The performance of the magnets show that dipoles can operate successfully at least at the lower end of this field range. (3 refs.)

100113 Superconducting combined function magnets. H.Hahn, R.C.Fernow (Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3402-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Superconducting accelerators and storage rings, presently under construction or in the design phase, are based on separate dipole and quadrupole magnets. It is here suggested that a hybrid lattice configuration consisting of dipoles and combined function gradient magnets would (1) reduce the number of magnet units and their total cost and (2) increase the filling factor and thus the energy at a given field. Coil cross sections are presented for the example of the Brookhaven Colliding Beam Accelerator. An asymmetric two-layer cable gradient magnet would have transfer functions of 10.42 G/A and 0.628 G cm^{-1}/A versus 15.77 G/A and 2.03 G cm^{-1}/A of the present separate dipoles and quadrupoles. (8 refs.)

100114 Superconductivity and future accelerators. G.T.Danby, J.W.Jackson (Accelerator Dept., Brookhaven Nat. Lab., Associated Univs. Inc., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3405-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
For 50 years particle accelerators employing accelerating cavities and deflecting magnets have been developed at a prodigious rate. New accelerator concepts and hardware ensembles have yielded great improvements in performance and GeV/$. The 'great idea' for collective acceleration resulting from intense auxiliary charged particle beams or laser light may or may not be just around the corner. In its absence, superconductivity (SC) applied both to RF cavities and to magnets opened up the potential for very large accelerators without excessive energy consumption and with other economies, even with the CW operation desirable for colliding beams. (5 refs.)

100115 Traveling-wave tube amplifier characteristics study for stochastic beam cooling experiments. B.Leskovar, C.C.Lo (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3423-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The characteristics of continuous-wave wideband traveling-wave tube amplifiers have been experimentally investigated over a frequency range of 1.5 to 4.5 GHz. The authors present measurements of characteristics important for stochastic beam cooling systems that are generally not available from manufacturers' data sheets. The amplifiers measured include models 1177 HO1 and 1277 HO1 having output power capabilities of 10 to 20 W, respectively, at frequencies of 2 to 4 GHz. The power transfer characteristics, the phase-shift characteristics as functions of frequency and the input power level, the voltage standing-wave ratio, harmonics and intermodulation products content were accurately measured and are discussed. Also several approaches are discussed for the reduction of harmonics and intermodulation products. (10 refs.)

100116 Design of the RF cavity and power amplifier for the Fermilab antiproton source. J.E.Griffin, J.A.MacLachlan, A.Moretti (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3435-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
In the Fermilab program, for production of an intense antiproton beam, trains of 82 short antiproton bunches (~1 nsec) separated by 18.8 nsec are produced with a large momentum spread about a mean energy of 8.9 GeV. The bunch trains are delivered to a debuncher ring where a 3% momentum bite is reduced to about 0.2% by exchanging momentum spread for time spread. During the bunch rotation the RF system is required to provide a stable RF voltage of 5 MV at 53.1035 MHz for 60 μ_{sec}, or about 35 turns. Then the voltage must be lowered to 98 kV within about 56 μ_{sec} to match the rotated distribution. The voltage is then reduced to 5 kV in about 12 msec for final adiabatic debunching of the antiprotons. The process is repeated at a 2 second repetition rate. The RF voltage is to be generated by eight RF cavities in a long straight section. Each cavity, when excited with 112 kW of RF power, will generate a peak voltage of 625 kV. Each cavity is excited by a self contained power amplifier mounted directly on top of the cavity to minimize RF interference with nearby high sensitivity stochastic cooling systems. (2 refs.)

100117 Performance tests of the 600-kW CW, 80-MHz, radio-frequency systems for the FMIT accelerator. R.F.Nylander, M.V.Fazio, F.F.Bacci, J.D.Rogers (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3438-40 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The high-power RF system for the Fusion Materials Irradiation Test (FMIT) accelerator consists of 14 sets of equipment, each of which can deliver up to 600 kW (CW) at 80 MHz into a load having a VSWR of 1.4 or less (any phase). Four sets have been shipped to Los Alamos for use with the accelerator [two with the radio-frequency quadrupole (RFQ) and two with the drift-tube linac (DTL)]. Tests conducted at Los Alamos, both into a resistive (electrolytic) load and into a resonant cavity (Q~21000), have confirmed that this system meets, and in most cases far exceeds, the specified performance limits. (no refs.)

100118 The RF system for the Los Alamos free electron laser (FEL). C.C.Friedrichs, P.J.Tallerico, W.J.Hoffert (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3441-3 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The FEL electron linac consists of three buncher cavities: two accelerator cavities and a deflection cavity, each with its own phase-current RF source. All sources will be pulsed for 100 μs at a 1-pps rate. The phase and amplitude stability requirements are ±1/2°, and ±1/2%. There are two subharmonic bunchers, each requiring 5 kW at 108.33 MHz. All remaining cavities operate at 1300 MHz. The fundamental buncher requires 5 kW, whereas each of the accelerating cavities requires at least 3 MW. The deflection cavity requires up to 100 kW, which is coupled from one of the accelerator cavity RF sources. Prominent features of the RF system are the phase and amplitude control circuits and the multimegawatt klystron amplifiers. (no refs.)

100119 SURF-II upgrade features magnet and RF system enhancements. G.Rakowsky (NBS, Washington, DC, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3444-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The NBS electron storage ring, SURF-II, has been upgraded with a number of major enhancements. The magnet system capability has been increased from 240 to 300 MeV, although actual operation is presently RF limited to 280 MeV. The storage ring magnet has been carefully mapped, resulting in more precise determination of beam energy and better radiometric data. The RF system has been augmented by an auxiliary second harmonic system, terminating in a novel, dual purpose cavity. This structure performs the function of the bump coil during injection, while during acceleration and stored beam operation it functions as a second harmonic cavity. In the latter mode it can either be tuned passively to suppress longitudinal bunch oscillations, or it can be driven actively to modify the longitudinal bunch shape. With proper amplitude and phasing relative to the main RF cavity, bunch lengthening can be achieved, resulting in improved beam lifetime without an increase in vertical size. (2 refs.)

100120 Damping ring RF system for SLC. M.A.Allen, H.D.Schwarz, P.B.Wilson (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3447-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The linear collider project at SLAC contains two damping rings to reduce the emittance of short electron or positron bunches which contain 5×10^{10} particles per bunch. Two of these bunches are stored at a time and then extracted for acceleration in the collider. The RF system is subject to strong transients in beam loading. A computer model is used to optimize capture while minimizing RF power. The introduction of phase jumps in the RF drive at injection time together with offsets in the tuning loops of the RF cavities when no beam is stored allows optimum performance under heavy beam load conditions. The RF system (800 kV at 714 MHz) for the electron damping ring has been built, tested and installed, and is being tested with a beam. (2 refs.)

100121 The RF-system for SuSe. W.Wilhelm, E.Dorner, G.Hinderer, E.Jaeschke, P.Kienle, W.Schott, U.Trinks (Phys.-Dept., Tech. Univ. Munchen, Garching, Germany).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3450-1 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The RF-System for SuSe consists of two large cavities in opposite valleys. The cavities are driven in the TE 101-mode and have a radial increasing voltage distribution. The maximum accelerating voltage per cavity is 1 MV at a power consumption of about 170 kW. A frequency variability in the range between 59 MHz and 74 MHz is possible in reducing the gap between the capacitively loaded lips, the fine tuning is done with two cylindrical perturbing objects. The cavities were optimized with the aid of the recently developed three-dimensional cavity calculation program CAV3D and measurements on several models in the scale 1:5, 1:8 and 1:2.5. A full scale power model is in construction. It will be tested with existing facilities at the Munich tandem laboratory, the large vacuum chamber HEXE and the RF power-generator for the post-accelerator SchwelN. A later application of this test cavity as part of a mass-separator is under consideration. (5 refs.)

100122 Three phase RF systems for superconducting cyclotrons. J.Riedel (NSCL, Michigan State Univ., East Lansing, MI, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3452-3 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The initial design of the MSU K500 cyclotron RF system was reported on at the 1979 Cyclotron Conference. In the course of bringing this system into operation some changes had to be made to that design, and these are discussed. (2 refs.)

100123 Criteria for vacuum breakdown in RF cavities. W.Peter, R.J.Faehl, A.Kadish, L.E.Thode (Los Alamos Nat. Lab., Advanced Concepts & Plasma Applications Group, Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3454-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A new high-voltage scaling based on Kilpatrick's criterion is presented that suggests that voltages more than twice the Kilpatrick limit can be obtained with identical initial conditions of vacuum and surface cleanliness. The calculations are based on the experimentally observed decrease in secondary electron emission with increasing ion impact energy above 100 keV. A generalized secondary-emission package has been developed to simulate actual cavity dynamics in conjunction with $2^1/_2$-dimensional fully electromagnetic particle-in-cell code CEMIT. The results are discussed with application to the suppression of vacuum breakdown in RF accelerator devices. (26 refs.)

100124 Experiments with very high power RF pulses at SLAC. H.A.Hogg, G.A.Loew, V.G.Price (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3457-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Experiments in which the powers of two SLAC klystrons were combined and fed into a resonant cavity pulse-compression system (SLED) are described. Pulse powers up to 65 MW into SLED were reached. The corresponding instantaneous peak power out of SLED was 390 MW. After normal initial aging, no persistent RF breakdown problems were encountered. X-radiation at the SLED cavities was generally less than 400 mR/hr after aging. The theoretical relationship between X-radiation intensity and RF electric field strength is discussed. (3 refs.)

100125 A high-Q ferrite-tuned cavity. L.M.Earley (Sandia Nat. Labs., Albuquerque, NM, USA), H.A.Thiessen, R.Carlini, J.Potter.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3460-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Rapid cycling proton synchrotrons, such as the proposed LAMPF II accelerator, require approximately 10 MV per turn RF with 17% tuning range near 50 MHz. The traditional approach to ferrite-tuned cavities uses a ferrite which is longitudinally biased (RF magnetic field parallel to bias field). This method leads to unacceptably high losses in the ferrite. At Los Alamos, the authors are developing a cavity with transverse bias to the bias field, making use of the tensor permeability of the ferrite. Initial tests of a small (10-cm-diameter) quarter-wave singly re-entrant cavity tuned by several different ferrites indicate that the losses in the ferrite can be made negligible compared with the losses due to the surface resistivity of the copper cavity. Details of the test results will be presented. (6 refs.)

100126 An RF electron beam buncher. J.L.Vomvoridis, T.Tajima, F.S.Felber, B.Spivey, R.O.Hunter,Jr. (Western Res. Corp., San Diego, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3466-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A method is described for producing density modulations on an intense relativistic electron beam by the use of RF fields in a betatron configuration. In concept, a device embodying this method should be capable of producing short (1-10 ns) electron bunches from a long (10-100 ns) beam, and is expected to be relatively compact and to operate efficiently on low power and energy. The method requires that the azimuthal phase velocity of the RF wave equal the electron beam velocity. Depending on phase relative to the RF wave, electrons in the beam gain or lose energy and form bunches by the negative mass effect. The dynamics of the electrons in the combined RF wave and betatron field have been analyzed. An example of an RF electron beam buncher is given. (no refs.)

100127 Field quality aspects of CBA superconducting magnets. S.Kahn, R.Engelmann, R.Fernow, A.F.Greene, J.Herrera, H.Kirk, J.Skaritka, P.Wanderer, E.Willen (Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3469-71 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A series of superconducting dipole magnets for the BNL Colliding Beam Accelerator, which were manufactured to have the proper field quality characteristics, has been tested. The authors present the analysis of the field harmonics of these magnets. (4 refs.)

100128 Magnetic properties of the iron laminations for CBA magnets. M.J.Tannenbaum, A.K.Ghosh, K.E.Robins, W.B.Sampson (Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3472-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The required magnetic properties of the iron for CBA dipoles are for the most part the same as those for conventional accelerators, namely low coercive force, high permeability at both low and high inductions and high saturation induction. There are two main differences in the CBA application: i) the iron is at 3.8K; ii) the magnetic field in the iron can go as high as 6 Tesla, which is well above saturation. Measurements of the magnetization curves for CBA iron laminations at 300K and 4.2K are presented. The data are analyzed in terms of a simple model in which the variation in saturation induction can be separated from the low field permeability variation. Tolerances on coercive force, permeability and saturation induction are discussed. (5 refs.)

100129 Development of a high power RF system for the Daresbury SRS. D.M.Dykes, B.Taylor (Sci. & Engng. Res. Council, Daresbury Lab., Daresbury, England).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3475-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The RF system for the high current electron storage ring is illustrated in its present state of development, attention being drawn to modifications and countermeasures added to the original design. Some of the characteristics, problems and achievements of the system are discussed. Practical techniques for the diagnosis of system problems are described. (2 refs.)

100130 Theoretical and observed behaviour of the Daresbury SRS RF system. E.A.Hughes (Sci. & Engng. Res. Council, Daresbury Lab., Daresbury, England).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3478-80 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Theoretical predictions of both the steady-state and transient behaviour of the SRS RF system are presented. These are compared with observed behaviour which includes anomalous steady-state beam loading and phase oscillations of the beam. The steady-state theory is shown to provide an adequate explanation of observations and some conclusions are drawn about beam phase oscillations. (2 refs.)

100131 Breakdown and resonance behaviour of the SRS waveguide. D.M.Dykes, A.Jackson, B.Taylor (Sci. & Engng. Res. Council, Daresbury Lab., Warrington, England).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3481-3 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
During the early running of the SRS storage ring the energy was limited to 1.8 GeV because of unexpected electrical breakdown in the waveguide-cavity system. High power tests showed an unacceptably large amount of third harmonic generated by the klystron, which was found to be produced by a faulty component in the feeder system. The faulty component was replaced, and the waveguide system rearranged. With these changes and the system adjusted to avoid any third harmonic modes, the RF system was immediately able to operate at full power. The SRS has since operated consistently at its design energy of 2 GeV with no RF trips from these effects. The low power tests revealed a rich resonance spectrum and that the magic trees only provide good isolation at the 500 MHz operating frequency thus the waveguide system forms a feedback loop at higher order mode frequencies with the circulating beam and the cavities. This may explain some of the beam instabilities observed in the SRS. (1 ref.)

100132 Time-jitter reduction on the RF buncher signal for the Los Alamos Proton Storage Ring (PSR). E.Higgins, G.Paffenroth (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3484-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The measure of control pursued by the described circuit design will provide RF references with timing uncertainty much less than the expected uncertainty in the micropulse time of arrival at the ring, $\Delta T \approx \pm 80$ ps. For the short-bunch PSR mode where timing is much more critical than for the long-bunch mode, and where the bunching wave has a $\approx$2-ns period, a maximum uncertainty of ± 10 ps was chosen as the error budget for the low-level RF system. The authors discuss the steps taken to develop the low-level RF reference signal with some measure of margin relative to this ± 10-ps budget. Phase-locked loop stabilizers, narrow-band high rejection-rate filters, and low-noise multipliers/dividers provided the means to achieve the goal. The multiplier described is part of a considerably larger system whose function is to generate several synchronizing signals for the PSR. (no refs.)

100133 Higher order mode studies in accelerator waveguides. D.R.Shoffstall, W.J.Gallagher (Boeing Aerospace Co., Seattle, WA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3487-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
While a study of the higher order modes of propagation in periodic structures has, perhaps, its own inherent interest, the motive for the investigation reported here was avoidance of beam excitation and interaction with higher order modes of a waveguide supporting an intended accelerating mode and the lessening of wake field effects by using the largest mean diameter in the waveguide consistent with the operating frequency. All the experimental data reported here was taken at 2856 mcs (10.5 cm) but clearly may be scaled. (8 refs.)

100134 A proposed second harmonic acceleration system for the Intense Pulsed Neutron Source Rapid Cycling Synchrotron. J.Norem, F.Brandeberry, A.Rauchas (Argonne Nat. Lab., Argonne, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3490-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The Rapid Cycling Synchrotron of the Intense Pulsed Neutron Source operating at Argonne National Laboratory is presently producing intensities of 2-2.5×10^{12} protons per pulse (ppp) with the addition of a new ion source. This intensity is close to the space charge limit of the machine, estimated at $\sim 3 \times 10^{12}$ ppp, depending somewhat on the available aperture. With the present good performance in mind, accelerator improvements are being directed at 1) increasing beam intensities for neutron science, 2) lowering acceleration losses to minimize activation, and 3) gaining better control of the beam so that losses can be made to occur when and where they can be most easily controlled. On the basis of preliminary measurements, the authors are now proposing a third cavity for the RF system which would provide control of the longitudinal bunch shape during the cycle which would permit raising the effective space charge limit of the accelerator and reducing losses. (5 refs.)

100135 A 'monochromatic' radio frequency accelerator cavity. S.Giordano (Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3493-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
In circular accelerators and storage rings it is important that any device placed in the beam line be relatively free of spurious resonances. Accelerating RF cavities inherently have an infinite number of spurious modes. The cavity described makes use of certain geometric construction configurations that eliminate all the spurious modes. A cavity was constructed with an accelerating TMolo mode of 90 MHz. Measurements showed that the TMolo mode was essentially unchanged from a conventional cavity but all modes up to 3 GHz were either completely eliminated or reduced by at least 30 db. (no refs.)

100136 A low coupling impedance double helix structure for use in a ferrite kicker magnet. S.Giordano (Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3496-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
In a machine such as the CBA, the ejection ferrite kicker magnet has a very large longitudinal and transverse coupling impedance which could destroy the beam. Using a double helix structure that surrounds the beam, the beam induced fields are confined within the helix and, therefore, decoupled from the kicker; but at the same time the helix is transparent to the external fields of the kicker. At first, this may seem paradoxial that the helix is opaque to the fields generated inside the structure by the beam and simultaneously transparent to the external fields generated by the kicker. (2 refs.)

100137 A second harmonic (6-16 MHz) RF system with feedback-reduced gap impedance for accelerating flat-topped bunches in the CERN PS Booster. J.M.Baillod, L.Magnani, G.Nassibian, F.Pedersen, W.Weissflog (CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3499-501 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Since all experimental and theoretical evidence indicates that the beam intensity in the PSB is at present limited by the Laslett Q shift after trapping, a

second harmonic accelerating system is being added with the aim of producing the flat-topped bunches. Calculations indicate that the resulting improvement in bunching factor should permit an intensity increase of 25 to 40%. Additionally, the bucket area is increased by 25 to 45% depending on intensity. A general description of the new cavities, which operate over a frequency range of 6-16 MHz with a maximum gap voltage of 8 kV, is given together with a description of associated power amplifiers and low level electronics. A notable feature is the use of a fast feedback system to reduce the gap impedance seen by the beam by an order of magnitude, incorporating a 130 W wide-band transistor amplifier with a total delay of about 5 ns. (8 refs.)

100138 Isolated bucket RF systems in the Fermilab Antiproton Facility. J.E.Griffin, C.Ankenbrandt, J.A.MacLachlan, A.Moretti (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3502-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983). (4 refs.)

100139 Buncher for a microwave linear electron accelerator. E.P.Westbrook (Condensed Matter & Radiation Sci. Div., Naval Res. Lab., Washington, DC, USA), R.L.Kyhl.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3505-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The authors report on design and construction features of a bunching system built at the Naval Research Laboratory (NRL) for a NRL linac, with emphasis on solution of the impedance matching and tuning problems inherent in the buncher design. (no refs.)

100140 Rapidly tuned buncher structure for the Los Alamos proton storage ring (PSR). L.M.Earley, G.P.Lawrence, J.M.Potter (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3511-13 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
In the PSR's short-bunch operating mode, accumulated beam currents are intense and change rapidly. The resonant frequency of the 503.125-MHz buncher used in this mode must be rapidly adjusted through a 100-kHz range to maintain the correct 90° phase relation between cavity voltage and beam current. Modulation rates are up to 3 kHz/μs. Each structure consists of two side-coupled buncher cavities, resonantly coupled to a ferrite-loaded tuner cavity. The needed frequency change Δf in the buncher cells is produced by a $50 \times \Delta f$ change in the tuner, accomplished by varying a magnetic field applied to the ferrite perpendicular to the RF magnetic field. Fast modulation of this bias is provided by a low-inductance ferrite-core magnet excited by a special function generator. The resonantly coupled multicavity structure configuration allows buncher and tuner cells to be independently optimized for their specific functions. The authors describe the buncher design, ferrite selection, and test results from a prototype ferrite-loaded tuner cavity. The tests have demonstrated the tuning scheme's feasibility, showing that the necessary 5-MHz range can be attained with only 12% of the tuner cell filled with ferrite, and that losses in the ferrite are small throughout this frequency interval. (5 refs.)

100141 An equivalent circuit model of the general 3-dimensional RFQ. R.M.Hutcheon (Chalk River Nuclear Labs., AECL, Chalk River, Ontario, Canada).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3524-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
An equivalent circuit model has been developed, based on the description of the RFQ as a terminated waveguide. The RFQ is modeled as a length of inductively loaded square waveguide operating in 'TE_{10}- and TE_{11}-like' modes in the dipole and quadrupole configurations respectively. This is described by 6 coupled first order differential equations using distributed values for the four quadrant shunt admittances and series impedances. The end terminations are represented by lumped terminating reactances. The first few orders of both dipole and quadrupole modes are described by the model. By relating the equivalent circuit values to physical dimensions, the effects on frequency and field distributions of vane momement, tube distortion, individual end tuner movement and vane strapping were determined. Agreement with measured properties is reasonable, and some new insights on RFQ operation have been gained. (7 refs.)

100142 Development of an RFQ linac at KEK. T.Kato, Z.Igarashi, C.Kubota, E.Takasaki, T.Takenaka, S.Fukumoto (KEK, Nat. Lab. for High Energy Phys., Ibaraki-ken, Japan).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3569-71 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
An RFQ model linac of 62 cm long at a frequency of 200 MHz was constructed using a computer program 'QKEK' developed at KEK. QKEK generates an RFQ linac, calculates beam dynamics, and provides geometrical data of vanes for a numerically controlled milling machine. A detailed study of RF characteristics was performed. The accelerating and focusing fields measured by the bead perturbation method on axis agree well with the design values. An RFQ linac, which accelerates protons from 50 keV to 750 keV, is designed. (4 refs.)

100143 Development of disk-and-washer cavity in KEK. S.Inagaki, T.Higo, K.Takata, H.Nakanishi, S.Noguchi, T.Furuya, K.Kitagawa, E.Ezura, Y.Kojima, T.Takashima (KEK, Nat. Lab. for High Energy Phys., Ibaraki-ken, Japan).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3572-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The behavior of the deflecting mode of the disk and washer structure was studied experimentally and computationally. A possibility was proved that the second HEM_1 passband can be moved above the accelerating frequency and that the value of R/Q can be increased by 60% compared to that of the shunt impedance optimized DAW cavity, if one makes a compromise with 80% of the optimized shunt impedance. The transverse coupling impedance of the second HEM_1 mode at π phase shift is less than 1 Mohm/m for a single cell, which is small by more than an order of magnitude compared to that of the re-entrant cavity or disk loaded cavity. (11 refs.)

100144 Parasitic modes removal out of operating mode neighbourhood in the DAW accelerating structure. V.G.Andreev, V.M.Belugin, S.K.Esin, L.V.Kravchuk, V.V.Paramonov (Inst. for Nuclear Res., Acad. of Sci., Moscow, USSR).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3575-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The disk and washer (DAW) accelerating structure finds its use in a number of new projects (PIGMI, SNQ, etc.). It composes the main part of the accelerating structure of the meson factory now under construction in the Institute for Nuclear Research (INR), Moscow. It is known, that the parasitic modes with azimuthal (ϕ) field variations exist at the operating mode region. In this report different methods of the parasitic modes frequency shift are considered. The main attention is given to the resonant methods, which are the most efficient. (9 refs.)

100145 On the way to the series production of steel-concrete cores for the LEP dipole magnets. J.P.Gourber, J.Billan, H.Laeger, A.Perrot, L.Resegotti (LEP Div., CERN, Geneva, Switzerland).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3614-14 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
CERN has now launched the series production of the steel-concrete cores for the LEP dipole magnets after a three-year development programme during which 14 prototypes were built in collaboration with industry. The paper describes the mechanical, geometrical and magnetic characteristics of these cores and the fabrication techniques which have been developed. Particular emphasis is put on the following points: the controlled mixing of steel in order to reduce the field variations between cores; the influence of the thickness and of the pitch of the laminations on the field quality, and the composition and working conditions of the mortar in relation to the tolerances on core geometry. (4 refs.)

100146 Radiation-hardened field coils for FMIT quadrupoles. R.J.Grieggs, D.J.Liska, A.Harvey (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3617-19 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Modern accelerators of the Fusion Materials Irradiation Test (FMIT) class deliver enormous power onto their targets. The high beam currents of such machines produce highly activating radiation fields from beam/target interaction and normal beam losses. The 100-mA deuteron beam from the FMIT accelerator produces a backstreaming fast-neutron flux of 10^{11} n/s-cm^2 near the target. In addition, the neutron contribution from distributed beam spill of 3 μA/m along the rest of the machine prevents the use of epoxy resin potting materials in all magnet field coils above 10-MeV beam energies. Two special techniques for radiation-hardened field coils have been developed at Los Alamos for use on the FMIT accelerator. One technique uses vitreous enamel coatings on the conductors and appears attractive for the drift-tube quadrupoles. Another method uses a thermally efficient two-layer coil design that has solid mineral-insulated (MI) conductors with indirect cooling coils, all bonded together in a lead matrix. Test results are discussed, along with applications of the quadrupoles in the FMIT facility that reduce gamma exposures during maintenance periods. (2 refs.)

100147 REC quadrupoles and dipoles with circular and elliptical cross sections. R.L.Gluckstern (Dept. of Phys., Univ. of Maryland, College Park, MD, USA), R.F.Holsinger.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3623-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The use of segmented rare earth cobalt (REC) rings to produce high field, high quality quadrupoles to focus charged particle beams is increasing. Current designs are based on the properties of 2-D rings with continuous rotation of the easy axis. Since many applications involve elliptically shaped beams, the authors explore the possibility of using elliptically shaped 2-D rings as a means of reaching higher fields with less REC material. After showing that such improvement is possible, they investigate the modifications required by segmentation numerically. (1 ref.)

100148 The higher order modes calculation of RF cavity with cylindrical symmetry. Wen Zhou (Nat. Synchrotron Light Source, Brookhaven Nat. Lab., Upton, NY, USA), Chu Xuanwen, Zhou Mingda.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2627-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Presents a new computer calculating method for cylindrical symmetry cavities. This method can calculate not only the fundamental mode and longitudinal modes but also the transverse higher modes. The Hertz vector is used as fundamental quantity and the separated variable method is applied. An empty cylindrical cavity has been calculated. The calculating result is in accord with analytic solution fairly well. (7 refs.)

100149 A method of correcting the SUPERFISH-calculated value of ZT^2/Q for cavities with truncate beam tubes. J.C.Amato, R.Sundelin, E.Blum (Lab. of Nuclear Studies, Cornell Univ., Ithaca, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3630-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The performance of an accelerating cavity can be characterized by the values of ZT^2/Q for each of the cavity's resonant modes. For cylindrically symmetric structures the program SUPERFISH can be used to find the field patterns of the azimuthally—invariant ('accelerating') modes. However, SUPERFISH is limited to lossless regions of space entirely enclosed by Dirichlet or Neumann boundaries, i.e. standing-wave solutions, and so cannot correctly treat the physical case of a cavity with open beam tubes through which energy can propagate. Instead, it is necessary to truncate the beam tubes with perfect reflectors, which introduce large amplitude standing-waves in the beam tubes, and consequently large errors in the calculated accelerating voltage and ZT^2/Q. In the past, these errors have been avoided by employing long tapered beam tubes. This technique requires a considerable amount of additional computer memory, and cannot be used when memory is at a premium. The authors describe a new technique which evaluates the errors in the accelerating voltage due to the truncated beam tubes. The method requires no special geometries or time-consuming calculations, and the results are in excellent agreement with other cavity calculations. (2 refs.)

100150 Numerical simulation of high power RF sources. A.T.Drobot, L.Seftor, K.Ko (Sci. Applications Inc., McLean, VA, USA), H.Hanerfeld, W.B.Herrmannsfeldt.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3633-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
In high power microwave tubes the efficient conversion of kinetic electron beam energy to RF in a narrow frequency band involves complicated nonlinear electron dynamics and may involve the spontaneous generation of waves at other frequencies. The authors describe the adaptation of an electromagnetic 2D-3V particle-in-cell code MASK to the simulation of such high power RF sources. In situations where the RF interaction results in the reflection of beam particles, or where there is the excitation of multiple modes internal to the microwave device, simulations are a new tool that permit a representation of the physical processes. In addition, they are capable of modeling the transient behavior and not just steady state operation. (1 ref.)

100151 A coupled eigenmode theory applied to RF structures. D.T.Tran (Thomson-CSF Electron Tube Div., Boulogne-Billancourt, France).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3636-8 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Presents a comprehensive analysis of the coupling mechanism between waves propagating in a periodic system of complex structure. The theory is developed in such a way as to utilize results from computer programs, based upon the finite-element method to solve the two-dimensional eigenvalue problem. The author first studies a single system, simple enough to be considered as being characterized by two regions, for which the eigenmodes are all known. A matrix analysis is developed next and applied to an n-port circuit, representing the whole system considered as an assembly of subsystems such as studied first. An example is given for illustration. Theoretical results and measurements are compared. (4 refs.)

100152 Three-dimensional analysis of RF electromagnetic fields by a finite element method. M.Hara, T.Wada, T.Fukasawa (Inst. of Phys. & Chem. Res., Saitama, Japan), F.Kikuchi.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3639-41 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The authors have developed a program which computes the resonant frequencies and fields in an arbitrary shaped three dimensional cavity by finite element method. They take the electric field $\mathbf{E}=(E_x,E_y,E_z)$ as unknown variables and solve the eigenvalue problem for the Maxwell equations in time-harmonic case imposing boundary conditions. Divergence-free condition is treated approximately by penalty method. They show the formulation for the three dimensional analysis of RF electromagnetic fields and some test calculations. Satisfactory results are obtained for rectangular cavities, cylindrical cavities and those with smoothly deformed parts. In the present calculations, number of the nodal points is limited to less than 1000 because of the memory size of the computer, which means about ten nodes in each direction. For very complicated boundry shapes, errors become large because mesh size is coarse and therefore the condition $\mathrm{div}\ \mathbf{E}=0$ is not fully satisfied, but this difficulty will be overcome with increasing available memory size. (4 refs.)

100153 Microwave measurements of azimuthal asymmetries in accelerating fields of disk-loaded waveguides. G.A.Loew, H.Deruyter, Wang Defa (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3642-4 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Presents microwave measurements of azimuthal asymmetries in the accelerating fields of the SLAC disk-loaded waveguide. These field asymmetries lead to RF phase-dependent beam steering which can be detrimental to operation of linear accelerators in general and of the SLAC Linear Collider in particular. (4 refs.)

100154 Experimental comparison of beam excited modes in biperiodic structures. K.C.D.Chan, H.Euteneuer, J.-P.Labrie, J.McKeown (Chalk River Nuclear Labs., AECL, Chalk River, Ontario, Canada).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3645-7 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
An experiment to study excitations of higher order modes in a coaxial coupled structure and an on-axis coupled structure is in progress. The tuning and assembly of these structures is complete. Calculations have shown that a coaxial coupled structure is 5% less sensitive to beam excitation of its axially symmetric modes than an on-axis coupled structure. Low power tests have identified mode frequencies above the accelerating mode passband showing that higher order modes propagate in an on-axis coupled structure and not in a coaxial coupled structure. High power beam tests are scheduled for late 1983. (10 refs.)

100155 Test facility for relativistic beam pickups. J.Simpson, R.Konecny, S.L.Kramer, D.Suddeth (Argonne Nat. Lab., Argonne, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3648-50 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The most frequently used method for bench-calibration of pickup devices is that of passing a (usually thin) wire through the device. Electrical excitation of the wire, as a TEM line, simulates a beam and the transfer functions of the device is measured directly. As many people have discovered, this procedure can frequently lead to incorrect predictions of pickup response to particle beams. The reasons for the differences are not always obvious, but plausible explanations are: 1) that wires are incapable of exciting or permitting many modes in the pickup structure which real beams excite; 2) that the interaction of the pickup device with the wire (e.g. large arrays of pickups such as independent striplines with outputs power added), produced unpredictable and unresolvable results. These deficiencies have been eliminated in a facility at ANL which uses a relativistic electron beam to calibrate beam pickups. The facility is extensively used in the development of pickups, and is the primary calibration facility for pickups designed for the FNAL TeV-I antiproton source. (1 ref.)

100156 Filters for stochastic cooling of longitudinal beam emittance. S.L.Kramer, R.Konecny, J.Simpson, A.J.Wright (Argonne Nat. Lab., Argonne, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3651-3 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The shorted stub filter has been used extensively to provide the electronics gain shaping for stochastic cooling of longitudinal beam emittance. The repetitive notch of this filter results from the cancellation of the incident signal by the reflected signal at frequencies where the cable electrical length equals an integer number of half wavelengths. The authors also describe another type of notch filter. This analysis demonstrates the advantages of this filter in providing small notch dispersion and other properties necessary for stochastic cooling systems. Because this filter uses only forward signals, it is quite insensitive to imperfections in cables and components, and can therefore be constructed from commercially available components. (10 refs.)

100157 Slot coupled beam signal pickup development at Argonne National Laboratory. J.D.Simpson, S.L.Kramer, D.Suddeth, R.Konecny (Argonne Nat. Lab., Argonne, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3654-6 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The need for more experimental studies plus the availability of Argonne's pickup test facility motivated an R&D activity for slot couplers at ANL. The goal is to experimentally examine the characteristics of aperature coupled beam signal pickups and to search for designs applicable to stochastic cooling systems. (4 refs.)

100158 An electron beam buncher to operate over the frequency range 1-4 GHz. D.A.Goldberg, A.A.Arthur, W.S.Flood, F.Voelker (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3657-9 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Presents a description of an electron buncher to be installed in the terminal of a Van de Graaff, which is to produce a modulated beam over the frequency range 1-4 GHz. The modulator geometry has been optimized so that the modulation amplitude should be nearly constant over the frequency ranges 1-2 GHz and 2-4 GHz. Preliminary results indicate the device work as predicted. (1 ref.)

100159 Mechanical and electrical design of the Fermilab lithium lens and transformer system. G.Dugan, C.Hojvat, A.J.Lennox, G.Biallas, F.Cilyo, M.Leininger, J.McCarthy, W.Sax, S.Snowdon (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3664-2 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A lithium lens focusing device will be used for the collection of 8 GeV antiprotons in the Fermilab Tevatron I Project. The details of the mechanical and electrical design of the Fermilab lens and its associated toroidal transformer are discussed. The lens, with a radius of 1 cm and length 15 cm, is expected to achieve gradients of 1000 T/m for a focal distance of 0.225 m. The gradient requires a current on the order of 5×10^5A, resulting in large electromagnetic and thermal stresses. The power supply discharge current and the effect of the inductant of the power leads and connections are minimized by the use of a toroidal matching transformer surrounding the lens itself. (6 refs.)

100160 The design parameters for a lithium lens as antiproton collector. A.J.Lennox (Fermi National Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3663-5 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Maxwell's equations with appropriate boundary conditions are solved for a pulsed cylindrical conductor. The results are applied to the lithium lens used as an antiproton collector for the Fermilab $\bar{p}p$ collider. The magnetic field is expressed as a function of radial distance and time. The time corresponding to maximum linearity is calculated. A method for measuring the current density at the surface is discussed and the Joule heat produced per pulse is calculated. (13 refs.)

100161 Design of a versatile ESQ transport system. J.Brodowski (Accelerator Dept., Associated Univs. Inc., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3666-8 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A versatile precision beam transport channel was built was inexpensive parts requiring minimum precision machining. The critical items, an optical bench and sliding bases are commercially available standard items. The only important precision machining is where a small section of an optical bench is used as a quadrupole assembly holding fixture. With this type of fixturing there is no loss of precision during the transfer of the quadrupole assembly from the EDM setup onto the final assembly, other than the manufacturer-specified mounting and dismounting tolerance. Displacement measurements of the pole tips taken on ten different quadrupole assemblies determined that RMS displacement in the 'x' direction was .000307″ and in the 'y' direction was .000290″. (3 refs.)

100162 Performance results of a low current, high gradient superconducting quadrupole magnet. R.P.Smith, J.D.Gonczy, D.C.Underwood (Argonne Nat. Lab., Argonne, IL, USA), P.H.Garbincius, P.O.Mazur, R.P.Stanek.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3672-4 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A large bore, high gradient superconducting quadrupole magnet has been fabricated and tested which generates a gradient of 60 T/m in a cold bore 12.7 cm in diameter and 2.8 m long. The magnet operates safely without active quench protection and the unwanted multipole fields of the magnet sum to four parts per thousand at a bore radius of 5.0 cm. The magnet has been exposed to a neutral secondary beam at Fermilab produced by targeting a 400 GeV/c primary proton beam on a 30 cm Be target. When operated at a gradient of 52.5 T/m (86% of short sample) the magnet is quenched at a primary beam intensity of 6×10^{11} protons per one second spill. The corresponding energy deposition in the magnet coils has been calculated to be 2 mJ/cm^3. (3 refs.)

100163 Dual aperture dipole with 2nd harmonic. W.F.Praeg (Argonne Nat. Lab., Argonne, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3675-7 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Two rapid-cycling accelerator rings are arranged in one magnet-iron structure. There are two sets of coils, one located in each ring, which are connected in series and excited with a first harmonic frequency. One DC bias coil and one second harmonic coil are common to both rings. The second harmonic reduces $\dot{B}$ during acceleration by 33% as compared to single frequency operation. The features of this economical arrangement are described and compared to more conventional systems. This system is especially suitable for combined function magnets. (4 refs.)

100164 Measurement of the SRS cavities higher order resonances using electron beam excitation. D.M.Dykes (Daresbury Lab., Sci. & Engng. Res. Council, Warrington, England).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3678-80 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The resonance spectra of two of the SRS cavities have been investigated by exciting their resonance modes with the circulating electron beam. During these studies the cavities were disconnected from the RF feeder system, with the electron energy loss being made up by the remaining two cavities in circuit. The method is described and the effect of different modes on the beam are presented. (3 refs.)

100165 Test of new accelerator superconducting dipoles suitable for high precision field. A.Patoux, J.Perot, J.M.Rifflet (CEA-CENS, Gif-sur-Yvette, France).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3681-3 (Aug. 1983).
(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Field homogeneity of superconducting dipoles for accelerators is still difficult to achieve. To reach the required homogeneity level of 10^{-4} the conductors must be located within a few hundreths of mm. At present all the superconducting machines in construction or in project use the most developed tech-

nique of the double shell configuration. This technique is very sensitive to conductor size and a great care must be taken to reach the needed field homogeneity. The design proposed in this paper is a current block configuration which uses accurately punched laminations with slots for conductor location. The design is then much less sensitive to conductor size. Furthermore the tooling needed to build such magnets is much less expensive than the one needed for the shell design. Three short dipoles have been constructed and tested. Very good results in field homogeneity have been obtained directly from the original design. (3 refs.)

100166 Pulsed ion beam generation with cryogenic-anode diode. T.Takahashi, K.Horioka, M.Hijikawa, A.Urai, K.Kasuya (Dept. of Energy Sci., Tokyo Inst. of Technol., Yokohama, Japan).
J. Appl. Phys. (USA), vol.54, no.8, p.4269-74 (Aug. 1983).
Magnetically insulated ion diodes with a cryogenically refrigerated anode are proposed and their characteristics are examined. Proton beams of 7 A/cm^2 and deuteron beams of 5 A/cm^2, with energy of about 80 keV are extracted from a refrigerated H_2O or D_2O anode with good reproducibility and reasonable repetition rate. (7 refs.)

100167 Carbon sample preparation for negative ion source. I.Brissaud, J.P.Mouffron (Inst. de Phys. Nucleaire, Orsay, France), J.M.Garnier, J.L.Michelot.
Rev. Phys. Appl. (France), vol.18, no.8, p.519-22 (Aug. 1983).
Numerous carbon samples were prepared by RF cracking of acetylene. These samples give a $^{12}C^-$ current as intense as pure graphite when used in a sputtering ion source of tandem accelerator. Isotopic fractionation $^{13}C/^{12}C$ is measured. (9 refs.)

100168 Symmetrical systems in charged-particle beam transport. C.M.Merry, J.C.Cornell (Nat. Accelerator Centre, CSIR, Faure, S Africa).
S. Afr. J. Phys. (S. Africa), vol.6, no.1, p.12-21 (1983).
The properties of symmetrical groupings of beamline elements such as dipole or quadrupole magnets used for charged-particle beam transport, are investigated using matrix methods. The symmetries studied form a complete abelian eight-group. Symplectic equations are used to simplify the matrix elements of the various systems. The complete transfer matrix of any symmetrical system can easily be obtained from the matrix of one half of the system, and the properties of the overall system can thus be predicted. A number of useful properties result from first- and second-order matrix elements which vanish because of the symmetry. (16 refs.)

100169 Beam transport systems consisting of two quadrupole triplets. J.C.Cornell, C.M.Merry (Nat. Accelerator Centre, CSIR, Faure, S Africa).
S. Afr. J. Phys. (S. Africa), vol.6, no.1, p.22-8 (1983).
The versatility of charged-particle beam transport systems consisting of two symmetric triplets of magnetic of electrostatic quadrupole lenses is investigated. It is shown that the two-triplet configuration can be operated with a number of different symmetries so that telescopic transfer properties are obtained. As a consequence of the symmetry, the system automatically has unit horizontal and vertical magnification ('unit telescope'). The transfer matrix elements for this system are calculated, and the operation of a typical system is illustrated by plotting rays traced through the system using matrix methods. Results are also presented for the more general cases of (a) unit magnification in one plane and variable magnification in the other ('modified telescope'), and (b) equal but variable magnifications in both planes ('zoom lens'). These characteristics are independent of the shape of the initial beam. (8 refs.)

100170 A quadrupole system for independent horizontal and vertical beam control. C.M.Merry, J.C.Cornell (Nat. Accelerator Centre, CSIR, Faure, S Africa).
S. Afr. J. Phys. (S. Africa), vol.6, no.1, p.29-34 (1983).
A system of quadrupole lenses is described for independent horizontal and vertical control of charged-particle beams from accelerators. Optimal positioning of the quadrupoles for both coincident and non-coincident initial waists is found by a simple analytic treatment. The operation of the system for a range of initial and final waist sizes is demonstrated by means of beam envelope plots derived from a program using a matrix representation of beam transport elements. The width of the final waist in either dimension can be varied over a wide range by adjusting the field strengths of only two quadrupoles, without affecting the width in the other dimension. 29.30 RADIATION SPECTROMETERS AND SPECTROSCOPIC TECHNIQUES

100171 Semiconductor telescope spectrometer for beta-ray spectra. W.Trzaska, J.Aysto, J.Kantele (Dept. of Phys., Univ. of Jyvaskyla, Jyvaskyla, Finland).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.221-5 (1 July 1983).
A telescope beta-ray spectrometer consisting of a 3 mm thick Si(Li) ΔE plus a 5 mm thick Ge(HP) E detector was built and tested. Simplicity and insensitivity to γ-rays (when operated in a coincidence mode) make the device well suited to β^+ and β^- end-point energy measurements, and it can also be used in on-line studies of very short-lived β emitters. Due to a number of effects associated with the interactions of the β-particles with the spectrometer, the calibration curves for $\beta+$ and β^- end-point energies were found to be different and were determined using several well-known β activities. As an application of the method, the ${}_{44}{}^{93g}$Ru β^+ end-point energy was measured. The result, 5315 (85) keV, is in good agreement with the prediction from the mass-systematics of the 1977 Mass tables. (11 refs.)

100172 A compact Compton suppression spectrometer using bismuth germanate scintillator. M.Mohsen (Dept. of Phys., King Abd El Aziz Univ., Jeddah, Saudi Arabia).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.241-4 (1 July 1983).
Geometrical and random sampling methods of calculation have been used to estimate the dimensions of a Compton suppression spectrometer using bismuth germanate (BGO) scintillator. Similar calculations have been done using sodium iodide. It has been found that the dimensions of the BGO shield can be decreased to nearly half those of NaI(Tl). (11 refs.)

100173 Cryogenic system for a superconducting spectrometer. J.Porter (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2909-10 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The Heavy Ion Spectrometer System (HISS) relies upon superconducting coils of cryostable, pool boiling design to provide a maximum particle bending field of 3 tesla. The author describes the cryogenic facility, including helium refrigeration, gas management, liquid nitrogen system, and the overall control strategy. (no refs.)

100174 Magnet coil system for a superconducting spectrometer (HISS). R.M.Reimers, R.C.Wolgast, R.M.Yamamoto (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2911-13 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The Heavy Ion Superconducting Spectrometer (HISS) facility and coils are briefly described while most of the paper discusses the support structures consisting of flanged doubly tapered stainless steel cylinders having a Z-shaped cross-section with average diameter of approximately 2.35 meters and height of approx. .49 meters. This member serves as a one piece coil support to resist gravitational, seismic, and magnetic forces with an approximate heat leak to helium of 59 watts per cylinder during operation of magnet at 4K. Maximum magnetic forces on each coil are over 11 meganewtons at 3 T excitation. Magnetic forces attracting the coils to the core vary with excitation in direction as well as in magnitude. Radial magnetic forces produce stresses internal to the coil bobbin. (5 refs.)

100175 Spectrograph for free electron laser experiments. R.C.Kennedy, J.L.Adamski (Boeing Aerospace Co., Seattle, WA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3142-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The design and construction of a Browne-Buechner type round pole face magnetic electron spectrograph is described. The design is based on the first order transfer properties of the bending magnet including the focal surface, dispersion, magnification and resolution. Second order aberrations are compared with numerical ray tracing results using measured field data to simulate the magnet. The numerical results are also compared with floating wire measurements on the system. Agreement is within one part in 10^4. Data extraction from the instrument is done with an array of copper detectors placed along the focal surface. The spectrograph has been successfully employed in free electron laser (FEL) experiments for over a year. (6 refs.)

29.40 RADIATION DETECTORS

(for mass spectrometers, see 07.75)

100176 Detection of charged particles with a phoswich counter. C.Pastor, F.Benrachi, B.Chambon, D.Drain (Inst. de Phys. Nucleaire, Univ. Claude Bernard Lyon-I, Villeurbanne, France), A.Dauchy, A.Giorni, C.Morand.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.209-15 (1 July 1983).
The essential features, construction details and performance of a phoswich detector are described. Results about the Z and mass identification, energy calibration and total energy response for protons, deuterons, tritons and alphas in the energy range from 20 up to 80 MeV are presented. (21 refs.)

100177 A new method for identification of low energy fragments with $8<Z\leq18$ in plastic track detector Makrofol. Z.Todorovic, R.Antanasijevic (Inst. of Phys., Beograd, Yugoslavia).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.217-19 (1 July 1983).
A new method is introduced to identify low energy fragments with charges of $8<Z\leq18$ in a plastic track detector Makrofol. Makrofol calibration is performed by using known ion beams. This method has been utilized to identify light fragments in binary events produced by the interactions of 12.7 GeV α-particles with Au. (9 refs.)

100178 Particle identification through the measurement of the Bragg curve centroid. K.Kimura (Dept. of Phys., Faculty of Sci., Kyushu Univ., Fukuoka, Japan).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.227-34 (1 July 1983).
A new method of particle identification in heavy ion reactions through the measurement of the Bragg curve centroid and particle energy has been developed using a gas ionization chamber with a resistive anode layer. Z-resolutions comparable to the conventional ΔE-E counter telescope could be attained easily. (5 refs.)

100179 Precision measurements of gamma-ray intensities. IV. Low energy region: ^{75}Se and ^{133}Ba. Y.Yoshizawa, Y.Iwata (Dept. of Phys., Faculty of Sci., Hiroshima Univ., Hiroshima, Japan), T.Katoh, J.-Z.Ruan, Y.Kawada.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.249-57 (1 July 1983).
Relative intensities of gamma rays were measured in Hiroshima and Nagoya in the region of 122-356 keV. Two Ge(Li) detectors were calibrated with four kinds of standard sources and a cascade gamma-ray source. The disintegration rates of the standard sources were determined by means of the coincidence method. Relative intensities of ^{75}Se and ^{133}Ba were obtained with estimated errors less than 1% for strong gamma rays. Gamma-ray intensities per decay were also extracted. (11 refs.)

100180 Precision measurements of gamma-ray intensities. V. ^{160}Tb, ^{168}Tm and ^{182}Ta. J.Jin, J.Takada, Y.Iwata, Y.Yoshizawa (Dept. of Phys., Faculty of Sci., Hiroshima Univ., Hiroshima, Japan).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.259-71 (1 July 1983).
For pt.IV see ibid., vol.212, no.1-3, p.249-57 (1983). Relative intensities of gamma rays in the decays of ^{160}Tb, ^{168}Tm and ^{182}Ta were precisely measured with a calibrated Ge(Li) detector. Experimental errors for strong gamma rays are 0.5-1%. A few new weak gamma rays for ^{168}Tm and ^{182}Ta were observed. Gamma-ray intensities per decay of three nuclides were derived from each of the relative intensities. These long-lived nuclides which emit multi-gamma-rays are useful for calibration of the gamma-ray spectrometer. (15 refs.)

100181 Gated time projection chamber. P.Nemethy, P.J.Oddone (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA), N.Toge, A.Ishibashi.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.273-80 (1 July 1983).
The authors describe test results on the operation of a gated time projection chamber. Symmetric pulses of ±120 V, applied to alternate wires of a gating

grid, turn the detector from an insensitive state to a sensitive state without impairing the readout of the chamber for more than 2.5 μs. (7 refs.)

100182 Pulse triggering mechanism of air proportional counters. T.Aoyama, T.Mori, T.Watanabe (Dept. of Nuclear Engng., Nagoya Univ., Nagoya, Japan).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.281-9 (1 July 1983).
The paper describes the pulse triggering mechanism of a cylindrical proportional counter filled with air at atmospheric pressure for the incidence of β-rays. Experimental results indicate that primary electrons created distantly from the anode wire by a β-ray are transformed into negative ions, which then detach electrons close to the anode wire and generate electron avalanches thus triggering pulses, while electrons created near the anode wire by a β-ray directly trigger a pulse. Since a negative ion pulse is triggered by a single electron detached from a negative ion, multiple pulses are generated by a large number of ions produced by the incidence of a single β-ray. It is therefore necessary not to count pulses triggered by negative ions but to count those by primary electrons alone when use is made of air proportional counters for the detection of β-rays. (16 refs.)

100183 Growth of the avalanche along the anode wire in a gas counter. II. J.Sanada (Tandem Accelerator Center & Inst. of Phys., Univ. of Tsukuba, Ibaraki, Japan).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.291-8 (1 July 1983).
For pt.I see ibid., vol.196, p.23 (1982). Using a long multi-cathode counter, the author investigated the growth of the avalance along the thin anode wire in a gas counter. In this paper, emphasis is put on the study of the pre-Geiger region. Coexistence, in an unstable mixture, of both a proportional mode and an under-developed Geiger-Muller mode was observed in this region; resulting in multiple peaks. (7 refs.)

100184 Plasma delay of ^{238}U ions in surface barrier detectors. H.-O.Neidel, H.Henschel (Univ. Giessen, Giessen, Germany), H.Geissel, Y.Laichter.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.299-300 (1 July 1983).
The authors have confirmed that the plasma delay of uranium ions with kinetic energies between 123 and 326 MeV does not increase significantly compared with the authors' results with fission fragments. (9 refs.)

100185 Effect of charge carrier collection on the shape of the amplitude spectrum of coaxial Ge(Li) detectors. V.P.Katkov, A.I.Krupman (Sci Res. Inst. of Radioisotope Instruments, Riga, USSR).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.327-32 (1 July 1983).
The paper presents a study of the effect of charge collection on the shape of the full energy peak for true coaxial Ge(Li)-detectors, homogeneous with respect to their electrophysical parameters. Calculations of amplitude spectra were carried out for a detector of 2.8 cm height, with 3.6 cm diameter, and with 0.6 cm diameter for the p^+-region. The transport of gamma radiation was simulated by means of a Monte Carlo method, and the process of charge collection was treated analytically. It is shown that resolution depends essentially on the rate of the collection efficiency in the region of the detector in which the greater part of the energy of a gamma photon is absorbed. Multiple scattering of gamma rays improves resolution under conditions of predominant hole trapping and deteriorates it if electron trapping dominates. The dependence of resolution on the electron trapping length at various hole trapping lengths are presented. (8 refs.)

100186 Bulk response of some polymeric nuclear track detectors to ionizing radiation. H.B.Luck (Akademie der Wissenschaften, Zentralinst. fur Kernforschung, Rossendorf/Dresden, Germany).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.371-3 (1 July 1983).
Response functions for bulk etching after electron or gamma irradiations are presented for Daicel, CR-39, PC and PETP. All response functions derived from available experimental data consist of a linear and one supralinear term. Based on the assumption that polymer chains are preferentially degraded from the chain ends the linear term can be explained in terms of a radiation induced growth in the surface concentration of chain ends. The supralinear term is supposed to be caused by the etching mechanism which is responsible for enhanced particle track etching as well. (27 refs.)

100187 Opto-electronic system for automatic track counting in plastic SSNTD. R.Flores, L.Ortiz, M.Moreno, G.Corkidi, A.Solar (Centro de Instrumentos, Univ. Nacional Autonoma, Mexico City, Mexico), M.Balcazar-Garcia.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.375-81 (1 July 1983).
A device which consists of an optical Fourier processor, a vidicon TV camera and integrated electronics was designed. This device is efficient in track counting for SSNTD, chemically as well as electro-chemically etched. The system's optical field of view covers the complete 1×1 cm^2 detector area and the count is displayed digitally. The complete processing time per detector is 1/60 s. A detailed description of the device and the counting procedure is given. (6 refs.)

100188 Response characteristics of cellulose nitrate track-detectors to radon and radon-daughter mixtures. T.M.J.Knofel, J.J.S.Estrada (CNEN, Inst. de Radioprotecao e Dosimetria, Rio de Janeiro, Brazil), O.A.P.Tavares, J.B.Martins, A.Goodwin.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.387-92 (1 July 1983).
The response of bare cellulose nitrate (CN) LR-115, type II (Kodak-Pathe), track detector exposed to various mixtures of radon and airborne radon-daughters is investigated. Under controlled irradiation conditions good linear correlation was obtained between through-etched track density ρ and the radon-daughter accumulated exposure ϵ_a (in units of WL-h). It is shown that the calibration factor $\Delta\epsilon_a/\Delta\rho$ for the CN LR-115, type II, track detector is an increasing function of the equilibrium ratios of the radon-daughter mixtures. (12 refs.)

100189 Large scintillation cells for high sensitivity radon concentration measurements. B.L.Cohen, M.El Ganayni, E.S.Cohen (Univ. of Pittsburgh, Pittsburgh, PA, USA).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.403-12 (1 July 1983).
Methods for improving the sensitivity of scintillation cells for radon concentration measurements were studied with emphasis on improving light collection efficiency. This allows the length and hence the volume of the cell to be increased. Variables studied were choice of scintillator material, its method of application and thickness, length of cell, cell material, type and configuration of reflectors, choice of photomultipliers, and factors affecting background. Response from various areas of the cell surface was studied with an alpha source and with radon filling. Coating the window with phosphor was found to be counter-productive. The optimum results obtained were with the inside of the cell (other than the window) covered with a thick layer of ZnS(Ag), or with a thick layer of reflective material coated with a thin layer of phosphor. With it, a 10 cm diameter plexiglass cell can be extended to at least 50 cm length without difficulty from insufficient pulse height a2940Me a2970−w a3510Bz b7420−m. (11 refs.)

100190 On the use of cellulose nitrate as solid state nuclear track detector. I. Detector preparation and etching behaviour. H.B.Luck (Akademie der Wissenschaften, Zentralinst. fur Kernforschung, Rossendorf/Dresden, Germany).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.479-82 (1 July 1983).
The study reveals that the surface etch rate ν_s of the CN detector is correlated to the fractional amount of disubstituted cellulose nitrate. The etching behaviour in KOH is characterized by a linear concentration dependence up to 6 mol/l. A further increase of the etchant concentration results in a steep growth of ν_s. The mechanism of alkaline degradation of cellulose nitrate is discussed. The appearance of an induction period in surface etching is supposed to be caused by a denitration reaction at the detector surface, which is considered to be nondegrading. (23 refs.)

100191 On the use of cellulose nitrate as solid state nuclear track detector. II. Response to light particles and applications. H.B.Luck (Akademie der Wissenschaften, Zentralinst. fur Kernforschung, Rossendorf/Dresden, Germany).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.483-7 (1 July 1983).
For pt.I see ibid., vol.212, no.1-3, p.479-82 (1983). As a result of a systematic investigation into the effect of the degree of substitution and the etching conditions on the response of cellulose nitrate to light particles a detector has been obtained which has an excellent sensitivity to protons, deuterons and alpha particles. A maximum sensitivity was attained using an etching procedure in 5N KOH at 70°C. A general response function was derived from 28 individual response functions for various material parameters and etching conditions. The experimental findings are discussed in terms of the concept of a free reaction volume. The applications of CN detectors in neutron dosimetry and energy determination of protons and alpha particles are considered. (23 refs.)

100192 Ion implanted nuclear radiation detectors passivated with anodic silicon oxide. J.Von Borany, G.Mende, B.Schmidt (Acad. of Sci., Central Inst. of Nuclear Res., Dresden, Germany).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.489-92 (1 July 1983).
Semiconductor radiation detectors are produced by planar technology using ion implantation for silicon doping and anodic oxidation for device passivation. An energy resolution of 13.5 keV for 5.486 MeV alpha-particles from ^{241}Am using active detector areas of about 13 mm^2 have been achieved. (9 refs.)

100193 The response of an isobutane filled ion chamber to heavy ions. A.N.James, P.A.Butler, T.P.Morrison, J.Simpson (Dept. of Phys., Univ. of Liverpool, Liverpool, England), K.A.Connell.
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.545-53 (1 July 1983).
A gridded ion chamber with its anode split to record both total energy and rate of energy loss has been used with isobutane gas to detect ions of seventeen elements ($17 \leq Z_1 \leq 92$) in the velocity range $2 < (137v/c) < 6$. The rate of energy loss and the ionisation collection efficiency were found to be independent of pressure over the range 15-50 Torr. The effective charge of the ion moving in the gas is observed to oscillate with Z_1. This variation and its effect on the resolution of the rate of energy loss signal are discussed. The effective charge of the moving ion in the ion chamber window (solid propylene) does not oscillate with Z_1 but probably depends on the ion charge before entering the window. (24 refs.)

100194 The pairing extrapolation ionization chamber for (n,γ) mixed field dosimetry. Meng Xiangqin, Lin Guijing (Inst. of Biophys., Acad. Sinica, Peking, China).
Nucl. Tech. (China), no.2, p.10-13 (April 1983). In Chinese.
The chambers are of gas flowing type. Basic features and parameters are measured in the X-ray, γ-ray and (n,γ) mixed field. The results of the experiments show that the chambers can be applied to measure neutron absorbed dose in (n,γ) mixed field. It is also suitable for accurate determination of absorbed dose of a thin layer sample. (4 refs.)

100195 p-type ultra-high purity silicon detector. You Naitan, Gu Guijun, Shen Weisheng (Shanghai Inst. of Nuclear Res., Acad. Sinica, Shanghai, China).
Nucl. Tech. (China), no.2, p.28-9 (April 1983). In Chinese.
The fabrication and performance of p-type ultra-high purity silicon detectors are described. A 50 mm$^2 \times$1.73 mm Si(HP) detector consists of a single crystal of p-type ultra-high purity silicon supplied by Zhejiang University, and at 77K, the resolution of the detector for ^{207}Bi 1063.4 keV K-electrons is 1.72 keV. (no refs.)

100196 Some performance characteristics of modern liquid scintillation counters. S.A.McQuarrie, C.Ediss, L.I.Wiebe (Faculty of Pharmacy, Univ. of Alberta, Edmonton, Alberta, Canada).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.7, p.1009-12 (July 1983).
Three examples of modern liquid scintillation counters were tested and several of their performance characteristics measured. Color and chemical quenched samples were counted in a Beckman LS 9000, a Packard 460C and a Tracor Mark III to test the reproducibility of different quench-monitoring techniques. Instrumental differences and similarities are discussed and related to the performance of these counters. All three counters operated reliably over a wide range of sample quenching. (7 refs.)

100197 Easy direct evaluation of NR images on cellulose nitrate films. M.Fantini, G.Renard (Res. Labs. Kodak-Pathe, Paris, France).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.745-6
The use of plastic films especially cellulose nitrate, presents many advantages. But the direct examination of frosted images is rarely possible. The most used way is the projection print on a photographic surface. Using an adequate viewer with adaptation of a simple crossed polarizing filters device, neutronic images can be evaluated as black and white radiographs. (no refs.)

100198 A study of the neutron radiographic parameters of some solid state nuclear track detectors. R.Ilic, M.Najzer, A.Podgornik, J.Rant (J. Stefan Inst., E. Kardelj Univ. of Ljubljana, Ljubljana, Yugoslavia).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.755-65
The main radiographic parameters such as signal exposure characteristics, spatial resolution and detail discernment were calculated. The theoretical calculations were verified by experiments using LR-115, CA-8015 and CR-39

detectors in combination with a boron screen ($Li_2B_4O_7$ and boron glass). The signal versus exposure (defined as the product of the average visible track area and track density) characteristics were found to be linear within exposure limits 0.5 to 5. The spatial resolution was assessed in terms of the edge spread function. Its dependence on the neutron beam divergence, particle range, critical angle of etching, track size and removed detector layer was studied. Analysis of the image inhomogeneity caused by statistical fluctuations in the number of tracks forming the image allowed the evaluation of the smallest detail discernible in a track-etch neutron radiograph as a function of different system parameters. (35 refs.)

100199 Fission neutron radiography with etch-track detectors. J.J.Antal (Army Materials & Mech. Res. Center, Watertown, MA, USA).
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.793-7
Neutrons in a fission spectrum of energies are readily available from the californium-252 isotope in a point-source configuration convenient for radiography. These neutrons, of 1-2 MeV energy, have penetration properties different enough from those of thermal neutrons generally used for radiography to be of interest in special radiographic situations. The author describes the AMMRC Californium Laboratory source facilities and describes his early work in developing etch-track imaging of fission neutrons for radiography. (1 ref.)

100200 Allyl diglycol carbonate as a track detector material for boron autoradiography. T.B.Cameron (Climax Molybdenum Co. of Michigan, Ann Arbor, MI, USA), J.E.Morral.
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.799-805
Neutron autoradiography is among the most valuable techniques for studying low boron concentrations (<100 ppm). However, poor etched track resolution in conventional CAB type solid state detectors has discouraged track counting and quantitative applications for this technique. An alternate material has been evaluated (trade name CR-39) and found to provide much improved etched track resolution as well as a lower minimum particle registration angle. The application of this material for measuring low concentrations of boron in iron is also described. (8 refs.)

100201 A model describing quantitative neutron autoradiography for boron in iron. T.B.Cameron (Climax Molybdenum Co. of Michigan, Ann Arbor, MI, USA), J.E.Morral.
Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.807-14
Because of the ability to measure low boron concentrations (<10 ppm) with a resolution approaching 1 μm, neutron autoradiography for boron is equivalent or superior to most of the sophisticated electron and ion beam instruments available. However, to this point only empirical relationships have been used to relate fission track etch pit density in solid state detectors with boron concentrations. A model has been developed which describes the relationship between track detector variables and boron concentration in iron. This model incorporates the concept of a minimum particle registration angle and can be used to compare various track detector materials. With this basis, the detection sensitivity for boron in grain boundaries and precipitates in iron is examined. (16 refs.)

29.60 COUNTING CIRCUITS AND NUCLEAR ELECTRONICS

100202 Spark-gap crowbar for high-voltage power supply. A.K.Mitra, P.J.Tallerico (Los Alamos Nat. Lab., Los Alamos, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2862-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A new crowbar circuit employing a pressurized spark gap has been designed to replace the existing ignitron crowbar that protects a 500-kW klystron tube when it arcs. The spark gap offers definite performance advantages when compared to the conventional ignitron circuits. The small overall size makes the spark gap more convenient and the very few components make it more reliable than the ignitron crowbar. (no refs.)

100203 Application of a digital trigger generator to NSLS booster and storage ring dipole power suppliers. B.B.Culwick, R.E.Olsen (Nat. Synchrotron Light Source, Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2865-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The digital trigger generator described by Olsen (1983) has been used to control a number of power supplies at the NSLS. Two extensions to the basic controller have been used to preserve its inherent high performance in particular applications. In the case of fast slew rate applications, the bandwidth limits of the supply generate errors in tracking the current reference. The repetitive nature of the NSLS booster cycle has made possible an adaptive feedforward scheme which corrects the errors of a given cycle based on data derived from previous cycles. For slowly varying current regulated supplies, the residual subharmonic ripple due to unbalanced phase voltages, transformer unbalance, etc. is corrected by means of a microprocessor based harmonic analyser which feeds data to the phase correction input of the controller. (1 ref.)

100204 A high performance digital triggering system for phase controlled rectifiers. R.E.Olsen (Nat. Synchrotron Light Source, Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2867-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The larger power supplies used to power accelerator magnets are most commonly polyphase rectifiers using phase control. While this method is capable of handling impressive amounts of power, it suffers from one serious disadvantage, namely that of sub-harmonic ripple. Since the stability of the stored beam depends to a considerable extent on the regulation of the current in the bending magnets, subharmonic ripple, especially that of low frequency, can have a detrimental effect. At the NSLS, a 12 pulse, phase control system has been constructed using digital signal processing techniques that essentially eliminates sub-harmonic ripple. (2 refs.)

100205 A bipolar, high precision, low ripple power supply. H.Pfeffer, R.J.Yarema (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2870-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A ±600 V, ±50 Amp high precision SCR power supply has been developed for use in the Energy Doubler Correction System. The bipolar output is accomplished by means of a dual converter with circulating current for smooth zero-crossing current transitions. Absolute accuracy better than ±.025% is achieved with a high precision tansductor, current reference, and other high quality components. Stability is better than 2.5 ppm/°C and voltage ripple is less than 30 mV peak to peak. Low ripple is achieved through the use of bipolar series-pass transistor bank. Ripple attenuation of the transistor bank is a minimum of 60 dB from DC to 2 kHz. Microvolt level noise and pickup in the power supply regulator ultimately set the ripple level in the power supply output. A special 'active ground' circuit is included to filter the common mode ripple which is inherent in SCR supplies. (3 refs.)

100206 Dual frequency ring magnet power supply with flat-bottom. W.F.Praeg (Argonne Nat. Lab., Argonne, IL, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2873-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
A power supply is described that furnishes an essentially flat-bottom injection field, followed by a dual frequency cosine field. This results in efficient beam capture during injection and reduces significantly the peak RF power required during acceleration in a rapid-cycling synchrotron. (1 ref.)

100207 Power supply regulation by microprocessor. J.Sheehan, H.Langenbach (Nat. Synchrotron Light Source, Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2876-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
Many small magnet power supplies are regulated by using a microprocessor system to generate control voltages to continuously servoregulate each power supply. The power supplies are of very simple design since all regulation and feedback hardware are parts of the microprocessor system. Most of the supplies are bipolar transistor followers, powered by a common unregulated DC power supply and are used to power trim steering magnets on the three NSLS synchrotron rings. Twelve bit accuracy is obtained using commercially available microprocessor PC cards. (1 ref.)

29.70 RADIATION MEASUREMENT, DETECTION AND COUNTING

(see also 29.30 Radiation spectrometers and spectroscopy, 29.40 Radiation detectors; for dosimetry, see 87.60M)

100208 A gas cell for Doppler-shift attenuation measurements up to 10^7 Pa. M.Bini, G.Poggi, N.Taccetti (Univ. Firenze, Firenze, Italy).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.235-40 (1 July 1983).
A cell suitable for Doppler-shift attenuation measurements in gas at high pressures is described. The variation of the gas density as a function of the beam current is studied for argon and krypton gases. Examples of lifetime measurements in the picosecond range are given. (11 refs.)

100209 Binomial vs. Poisson statistics in radiation studies. J.Foster, K.Kouris, I.P.Matthews, N.M.Spyrou (Dept. of Phys., Univ. of Surrey, Guildford, England).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.301-5 (1 July 1983).
The processes of radioactive decay, decay and growth of radioactive species in a radioactive chain, prompt emission(s) from nuclear reactions, conventional activation and cyclic activation are discussed with respect to their underlying statistical density function. By considering the transformation(s) that each nucleus may undergo it is shown that all these processes are fundamentally binomial. Formally, when the number of experiments N is large and the probability of success p is close to zero, the binomial is closely approximated by the Poisson density function. In radiation and nuclear physics, N is always large: each experiment can be conceived of as the observation of the fate of each of the N nuclei initially present. Whether p, the probability that a given nucleus undergoes a prescribed transformation, is close to zero depends on the process and nuclide(s) concerned. Hence, although a binomial description is always valid, the Poisson approximation is not always adequate. Therefore further clarification is provided as to when the binomial distribution must be used in the statistical treatment of detected events. (9 refs.)

100210 Experimental dead-time distortions of Poisson processes. G.Faraci, A.R.Pennisi (Istituto di Fisica, Univ. di Catania, Catania, Italy).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.307-10 (1 July 1983).
In order to check the distortions, introduced by a nonextended dead time on the Poisson statistics, accurate experiments have been made in single channel counting. At a given measuring time, the dependence on the choice of the time origin and on the width of the dead time has been verified. An excellent agreement has been found between the theoretical expressions and the experimental curves. (14 refs.)

100211 Two-dimensional curve fitting in counting experiments. T.Awaya (Dept. of Phys., Coll. of Sci. & Engng., Aoyama Gakuin Univ., Tokyo, Japan).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.311-17 (1 July 1983).
The author's (1979, 1980) method is applied to a two-dimensional curve fitting to the generated data with normal and Poisson errors in abscissa and ordinate, respectively. The method is compared with the least-squares one. It is concluded that the latter introduces significant deviations as the total count decreases and the former gives good results. (2 refs.)

100212 Upper limit of peak area. O.Helene (Inst. de Fisica, Univ. de Sao Paulo, Sao Paulo, Brazil).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.319-22 (1 July 1983).
The author discusses the determination of the upper limit of peak area in a multi-channel spectra with a known significance level. This problem is especially important when the peak area is masked by the background statistical fluctuations. The problem is solved exactly and, thus, the results are valid in experiments with small numbers of events. Results are presented for a Monte Carlo test and applied to the ^{92}Nb beta decay. (12 refs.)

100213 A simple method for detecting the radioactivity leakage of sealed high-level ^{60}Co sources in water well. Chen Jingfeng, Kou Xiuezhong, Ge Zhaohua, Yie Zhongquan, Zhang Yuejing, Yu Yue (Inst. of Biophys., Acad. Sinica, Peking, China).
Nucl. Tech. (China), no.2, p.55 (April 1983). In Chinese.
A simple and safe method is described to detect the radioactivity leakage from the stainless-steel shielded high-level cobalt-60 sources in water well. The source checked is placed in a small special sealable sampling can filled with water. After being kept a few days, water in the sampling can is pumped out and assayed. (no refs.)

100214 Measurements of radioactive materials: specifications of the limit of detection and the possibility of reaching them. M.Tschurlovits (Atominst. Osterreichischen Univ., Wien, Austria).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.7, p.965-71 (July 1983).
A consistent description of the required assumptions for the establishment of the lower limit of detection (LLD) when measuring radioactive substances is given. This description includes both the conceptual requirements and their fulfilment. The selection of a reasonable unit for the LLD and the significance level is discussed. The counting time, which can be chosen in a limited range, is considered. In addition, the figure of merit consisting of equipment parameters, namely efficiency and background rate, is used. However, both efficiency and background rate are subject to influence by the sample to be counted. This influence is discussed by means of a few examples which are taken from radiation protection measurements. Finally the range where the applied formalism can be used is checked empirically. (12 refs.)

100215 Energy-loss straggling and higher-order moments of energy-loss distributions for protons. E.Kuhrt, R.Wedell (Sektion Phys., Humboldt-Univ. Berlin, Berlin, Germany).
Phys. Lett. A (Netherlands), vol.96A, no.7, p.347-9 (18 July 1983).
Using the classical collision theory for two moving charged particles the energy-loss straggling and the skewness of an energy-loss distribution for protons passing a medium are calculated. It is shown that the motion of the target electrons is responsible for significant deviations from Bohr's results (1948) in the low-energy region. (13 refs.)

100216 Energy loss and energy straggling of protons and pions in the momentum range 0.7 to 115 GeV/*c*. S.Hancock (Imperial Coll. of Sci. & Technol., London, England), F.James, J.Movchet, P.G.Rancoita, L.VanRossum.
Phys. Rev. A (USA), vol.28, no.2, p.615-20 (Aug. 1983).
The energy-loss distribution for pions and protons, with momenta between 0.7 and 115 GeV/*c*, has been measured in an ion-implanted silicon detector of 300 μm thickness. The data are well described by an empirical energy-loss distribution. (24 refs.)

100217 Z_1^3 dependence of the energy loss of an ion passing through an electron gas. C.C.Sung, R.H.Ritchie (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Phys. Rev. A (USA), vol.28, no.2, p.674-81 (Aug. 1983).
The theory of the energy loss of an ion with charge $Z_1 e$ passing through an electron gas is considered. The term proportional to Z_1^3 in the expression for the stopping power of the medium is derived by taking a second functional derivative of the induced charge in the medium and is expressed as a product of three Green's functions. The actual evaluation is effected by separately treating the momentum transfer to distant and close collisions. Also, it is assumed that the Fermi energy E_F is less than $\hbar\omega_p$, the plasmon energy of the medium. The contribution to the Z_1^3 term from distant collisions is similar to that obtained by others using an atomic model for the stopping medium if one replaces that atomic binding energy by $\hbar\omega_p$. The contribution from the region of close collisions is shown to be unimportant compared to that from distant collisions because screening of close collisions is expected to be negligible in the electron gas. This work will discuss related work by Lindhard and Esbensen, and by Arista, who arrive at different conclusions with respect to this impact-parameter dependence. (18 refs.)

100218 Track and vertex fitting in an inhomogeneous magnetic field. J.C.Hart, D.H.Saxon.
Report RL-83-006, Rutherford Appleton Lab., Chilton, Oxon., England (May 1983), 45 pp.
Methods have been developed for fitting tracks and vertices in an inhomogeneous magnetic field for the PT55 experiment at Nimrod. Details of the methods, including the correction for $E\times B$ effects, are given. (9 refs.)

29.80 NUCLEAR INFORMATION PROCESSING

100219 FASTBUS for data acquisition and control. L.Costrell (Center for Radiation Res., NBS, Washington, DC, USA), W.K.Dawson.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.1, p.2147-51 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
FASTBUS is a standardized modular data-bus system for data acquisition, data processing and control applications. It is the result of an interlaboratory development undertaken to meet the needs of the high energy physics community. However, the versatility, speed and addressing capability of FASTBUS make it attractive for many other types of application. A FASTBUS system consists of bus segments which operate independently but dynamically link together as needed for operation passing. This parallel processing feature accounts to a great extent for the high throughput of FASTBUS in multisegment systems. Master modules compete for single or multiple Segment Control through a bus arbitration scheme using assigned priorities. Logical, geographical, secondary and broadcast addressing methods are used to access either data space or control and status register space. Features include block transfers, a sparse data scan and interrupts. (no refs.)

100220 The LBL magnetic measurements data acquisition system. M.I.Green, D.H.Nelson (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3596-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).
The LBL Magnetic Measurements Engineering (MME) Group has developed a real-time data acquisition system (DAS) for magnetic measurements. An LSI 11/23 microcomputer is interfaced to a clock-calendar, printer, CRT control terminal, plotter with hard copy, floppy and hard disk, GPIB, and CAMAC buses. Off-the-shell hardware and software have been used where possible. Operational capabilities include: (1) measurement of high permeability materials, (2) harmonic error analysis of (a) superconducting dipoles and (b) rare earth cobalt (REC) and conventional quadrupole magnets, and (3) 0.1% accuracy x-y mapping with Hall probes. Results are typically presented in both tabular and graphical form during measurements. Only minutes are required to switch from one measurement capability to another. Brief descriptions of the DAS capabilities, some of the special instrumentation developed to implement these capabilities, and planned developments are given. (13 refs.)

31.10 GENERAL THEORY OF STRUCTURE, TRANSITIONS AND CHEMICAL BINDING

100221 Density functional theory of asymptotic form of electron density in heteronuclear diatomic molecules. J.A.Alonso, N.H.March (Theoretical Chem. Dept., Univ. of Oxford, Oxford, England).
J. Chem. Phys. (USA), vol.79, no.4, p.1903-5 (15 Aug. 1983).
Density functional theory is shown to lead to a simple differential equation for the asymptotic form of the electron density in a diatomic molecule. This equation can be solved, if one assumes building blocks which in a heteronu-

clear diatomic molecular correspond to fractionally charged ions. The resulting expression for the asymptotic electron density can be approximately expressed in terms of the fractional charge and the chemical potentials of the two free atoms. Two models are proposed for estimating the fractional charge. (18 refs.)

100222 Topology of the electronic current density in molecules. J.A.N.F.Gomes (Dept. de Quimica, Faculdade de Ciencias, Porto, Portugal).
Phys. Rev. A (USA), vol.28, no.2, p.559-66 (Aug. 1983).
Presents the first complete topological description of the electronic-probability current-density field in molecules under an external homogeneous magnetic field. The analysis is general, applying both to the many-electron current density and to its one electron (orbital) components. The singular lines of the vector field form a stagnation graph which is the skeleton of the qualitative theory presented here. This graph may be disconnected, with one connected part playing a leading role in the description. Other secondary connected parts are encased into topologically spherical separatrices defined by two isolated singular points. This is one of the types of separatrices which are introduced here. The other one is defined by saddle singular lines and encases the axial vortices which are associated with the vortex stagnation lines. The vertices of the stagnation graph are critical points of the current-density field, points where the stagnation lines may branch out according to an index theorem that is proved here. The basic units in this qualitative description of the current field are axial or toroidal vortices. Each vortex is a whirlpool of electronic-charge probability flowing around a vortex stagnation line and encased into a closed separatrix. Vortices may exist inside other vortices but separatrices cannot cross one another. Saddle stagnation lines belong to the boundary of four or more axial vortices. (20 refs.)

100223 Relativistic quantum-defect theory. General formulation. Jwei-Jun Chang (Vil Computing Lab., Artesia, CA, USA).
Phys. Rev. A (USA), vol.28, no.2, p.592-603 (Aug. 1983).
A relativistic multichannel quantum-defect theory is formulated in the same way as in the nonrelativistic theory of Seaton (1966, 1978). The solutions to the radial Dirac-Coulomb equations are reviewed in complex values of energy. The simple-model problem with finite-range potentials is used to clarify the scattering matrix and the reactance K matrix. The close-coupling approximation is discussed for real atomic systems. (12 refs.)

31.15 GENERAL MATHEMATICAL AND COMPUTATIONAL DEVELOPMENTS

100224 Characteristic function of momentum density distribution. II. T.Koga (Dept. of Appl. Chem., Muroran Inst. of Technol., Hokkaido, Japan).
J. Chem. Phys. (USA), vol.79, no.3, p.1384-6 (1 Aug. 1983).
For pt.I see ibid., vol.77, p.6345 (1982). Rigorous relations between the moments $\langle p_x{}^l p_y{}^m p_z{}^n \rangle$ and $\langle p^n \rangle$ and the characteristic function $B(r)$ of the momentum density distribution $\rho(p)$ are here generalized to the case of negative l, m, and n. A simple application is given which illustrates that the present results enable the author to obtain the moments of momenta without referring to any momentum-space quantity. (11 refs.)

100225 Universal basis sets of elliptical functions. S.Wilson (Dept. of Theoretical Chem., Univ. of Oxford, Oxford, England).
J. Phys. B (GB), vol.16, no.15, p.L429-31 (14 Aug. 1983).
The use of universal basis sets of elliptical functions in molecular electronic structure calculations for diatomic molecules is discussed. It is shown that universal elliptical basis sets have a number of advantages in studies of diatomic molecules over the more frequently used exponential-type and Gaussian-type basis sets. (11 refs.)

100226 Analytical results for Coulomb integrals with hydrogenic and Slater-type orbitals. D.Belkic (Inst. of Phys., Belgrade, Yugoslavia).
J. Phys. B (GB), vol.16, no.15, p.2773-84 (14 Aug. 1983).
Atomic form factors containing the product of the Coulomb wavefunction $\langle \mathbf{r}|\mathbf{k}\rangle$ with either the hydrogenic or Slater-type orbital $\langle \mathbf{r}|nlm\rangle$, are calculated in a closed form, for an arbitrary triple nlm. By choosing the quantisation axis for $|nlm>$ along the vector $\mathbf{k}$, it is shown that the present integrals can be reduced to a linear combination of easily calculable hypergeometric polynomials of two and three variables. Results are particularly useful for second-order theories of charge exchange, notably CDW and CIS approximations. (17 refs.)

100227 New approach to the calculation of density functionals. G.Zumbach, K.Maschke (Inst. de Phys. Appl., Ecole Polytech. Federale, Lausanne, Switzerland).
Phys. Rev. A (USA), vol.28, no.2, p.544-54 (Aug. 1983).
The density-functional theory relates the ground-state properties of an N-electron system to a universal functional of the charge density. The authors discuss a functional which avoids the problems of the Hohenberg-Kohn theory. They show that this functional can be calculated exactly, at least in principle. They present an upper bound for this functional, which is applied to the case $N=1$ and to the jellium problem. This upper bound is exact for $N=1$. (9 refs.)

31.20 SPECIFIC CALCULATIONS AND RESULTS

100228 Symmetry and broken symmetry in molecular orbital (MO) descriptions of unstable molecules. Generalized MO theoretical studies on 1,3-dipolar species. K.Yamaguchi (Dept. of Chem., Osaka Univ., Osaka, Japan).
THEOCHEM (Netherlands), vol.12, p.101-20 (Aug. 1983).
The electronic and geometrical structures of 1,3-dipolar species are investigated by the semiempirical and ab-initio molecular orbital methods and energy gradient techniques. The diradical character (order parameter) is calculated to express quantitatively the symmetry and broken symmetry properties of their frontier orbitals. The clusterings of water to carbonyl oxide are investigated as an example for the stabilizations of unstable molecules by polar solvents. The present MO theoretical treatments indicate both nonradical and diradical behaviors of unstable 1,3-dipolar species such as carbonyl ylides, compatible with various experimental results reported by Huisgen (1977) and others. (46 refs.)

100229 Formulation of the total molecular energy in semi-empirical SCF-MO method with overlap: application to the determination of the approximate equilibrium geometry. C.Barbier (Lab. de Chimie Phys. Moleculaire, Univ. Claude-Bernard, Villeurbanne, France), G.Del Re.
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.19, p.1481-4 (30 May 1983). In French.
An expression for the evaluation of nuclear and screening contributions to the total energy is proposed. This expression is valuable for semi-empirical SCF methods without neglecting overlap. This method is utilized for the simple systems CO, FeCo, NiCO. (11 refs.)

100230 Reduced partition function ratios of titanium, zirconium, and hafnium compounds. K.Kogure, M.Kotaka, M.Okamoto (Tokyo Inst. of Technol., Tokyo, Japan).
Bull. Res. Lab. Nucl. React. (Japan), vol.8, p.19-28 (1983).
The reduced partition function ratios for some compounds of titanium, zirconium, and hafnium were calculated as functions of temperature using the general valence force field. The contribution of each normal vibrational frequency to the reduced partition function ratios was evaluated. The magnitudes of reduced partition function ratios of titanium, zirconium, and hafnium compounds at 300K were in the following sequences, respectively. $TiO_4{}^4 > TiF_4 > TiCl_4 > TiBr_4 > TiI_4 > TiO > TiCl$, $ZrO_4{}^{4--} > ZrBr_4 > ZrCl_4 > ZrI_4 > ZrO$, $HfO_4{}^{4-} > HfCl_4 > HfBr_4 > HfI_4$. (12 refs.)

100231 Conformations of simple disulfides and L-cystine. R.J.Boyd, J.S.Perkyns, R.Ramani (Dept. of Chem., Dalhousie Univ., Halifax, NS, Canada).
Can. J. Chem. (Canada), vol.61, no.6, p.1082-5 (June 1983).
Ab initio molecular orbital calculations at the STO-3G and STO-3G* levels on H_2S_2, $(CH_3)_2S_2$, $(CH_3CH_2)_2S_2$, and L-cystine show that the minimum energy conformation occurs at the angle at which the S-S overlap population is at a maximum. In agreement with experiment, the calculations favour a disulfide dihedral angle close to 90°. The variation of the S-S overlap population is essentially independent of substituents, whereas the cis barrier to rotation about the S-S bond increases relative to the trans barrier as the size of the substituents increases. These observations lead to the conclusion that electronic effects determine the disulfide dihedral angle and that both steric and electronic effects control the relative magnitude of the cis and trans barriers. (19 refs.)

100232 The vinyloxonium cation ($CH_2CHOH_2{}^+$). R.H.Nobes, L.Radom (Res. School of Chem., Australian Nat. Univ., Canberra, Australia).
Chem. Phys. Lett. (Netherlands), vol.99, no.2, p.107-11 (29 July 1983).
Ab initio molecular orbital calculations with large basis sets and incorporating correlation are used to examine the structures and relative energies of the vinyloxonium ($CH_2CHOH_2{}^+$) and 1-hydroxyethyl (CH_3CHOH^+) cations. The best structure of the vinyloxonium ion has the OH_2 plane perpendicular to the CCO plane. The energy difference between the vinyloxonium and 1-hydroxyethyl cations is predicted to be 92 kJ mol^{-1}, substantially greater than a recent experimental estimate of 41 ± 12 kJ mol^{-1}. (16 refs.)

100233 Proper characterization of MC SCF stationary points. J.T.Golab, D.L.Yeager (Dept. of Chem., Texas A&M Univ., Coll. Station, TX, USA), P.Jorgensen.
Chem. Phys. (Netherlands), vol.78, no.2, p.175-99 (15 July 1983).
The authors discuss several characteristics that an MC SCF stationary point should fulfil in order to be a proper representation of the exact Nth state in energy of a certain symmetry. The authors derive an MC SCF iterative scheme that invokes some of these characteristics directly as conditions on the iterative algorithm. Numerical examples demonstrate that convergence is obtained rapidly and reliably to a stationary point with this algorithm. Numerical examples also demonstrate one main point of this paper, i.e. the importance of carefully examining the characteristics of an MC SCF stationary point before assigning it to be an approximate representation of a state. Several different stationary points have been determined for BeO that satisfy some or all of the conditions for being an approximate representation of the same state and it is often not at all clear which stationary point should be chosen as a representative of the desired state. This difficulty may be present in all current and previous MC SCF calculations. (25 refs.)

100234 Complete valence-shell ionization spectra of N_2 and CO: application of the extended two-particle-hole Tamm-Dancoff approximation (2ph-TDA). J.Schirmer, O.Walter (Inst. fur Phys. Chem., Univ. Heidelberg, Heidelberg, Germany).
Chem. Phys. (Netherlands), vol.78, no.2, p.201-11 (15 July 1983).
Green's function studies of the valence-shell ionization spectra of N_2 and CO are reported. The employed method of calculation is the previously derived extended two-particle-hole Tamm-Dancoff approximation (2ph-TDA). This approximation gives a consistent treatment of the one-particle Green's function through third order in the electronic repulsion. Very accurate results are obtained for the outer-valence ionization potentials. The extended 2ph-TDA also allows for an improved description of the inner-valence ionization where as a rule the single-particle picture of ionization no longer applies. The present calculations are devised as a model application of the extended 2ph-TDA. A large orbital basis set has been employed and only minor technical approximations have been introduced. Comparison is made with results from other theoretical approaches, in particular with those of the related third-order equations-of-motion (EOM) scheme. (44 refs.)

100235 Can the H_5 molecule be observed?. K.Kaufmann, M.Jungen (Inst. of Phys. Chem., Univ. of Basel, Basel, Switzerland), V.Staemmler.
Chem. Phys. (Netherlands), vol.79, no.1, p.111-15 (15 Aug. 1983).
The energy levels of the Rydberg states of H_5 and their stability with respect to dissociation into H_3+H_2 have been studied with quantum-chemical methods. The authors predict that the lowest four electronic states of H_5 are dissociative, but that many Rydberg states are metastable. The lowest one of them (1^2B_2 in D_{2d} symmetry) has a dissociation energy of ≈ 76.6 kJ/mol; the higher ones are less strongly bound, some of them being distorted to C_{2v} symmetry by a Jahn-Teller distortion. The authors have also estimated emission frequencies and transition moments of the transitions from higher Rydberg states into the 1^2B_2 state. (16 refs.)

100236 Compton profiles and momentum expectation values, for atomic system gallium through krypton. B.S.Sharma (Dept. of Phys., D Jain Coll., Baraut, India), A.N.Tripathi.
Indian J. Phys. Part B, vol.57B, no.1, p.6-12 (Feb. 1983).
Compton profile in the impulse approximation and the momentum expectation values $\langle p^n \rangle$, have been calculated for the atoms gallium to krypton using three types of wave functions, viz. Gaussian type orbitals (GTO), Slater type orbitals (STO) and its Gaussian expansion (STO-NG) with $N=2$ to 6. It has been found that the peak values of the Compton profile calculated by STO-6G wave functions approaches to the respective true results (i.e. STO values). GTO wave functions give a flattened Compton profile compared to the other two wave function. Further, peak value is in good agreement with the value obtained using a relativistic Hartree Fock wave function. It is observed that the Gaussian type orbitals are well suited for the evaluation of the Compton profile since the key deficiency of GTOs, i.e. their incorrect behaviour at the nuclei, is moved to a region of little importance in momentum space. (20 refs.)

100237 Ab initio SCF study of hyperfine couplings, geometries, and inversion barriers in the isoelectronic radicals NF_3^+, CF_3, and BF_3^-. M.A.Benzel, A.M.Maurice, R.L.Belford, C.E.Dykstra (School of Chem. Sci., Univ. of Illinois, Urbana, IL, USA).
J. Am. Chem. Soc. (USA), vol.105, no.12, p.3802-5 (15 June 1983).
Ab initio SCF molecular orbital calculations with double-ζ and polarized double-ζ bases are reported for the isoelectronic series of C_{3v} radicals $.NF_3^+$, $.CF_3$, and $.BF_3^-$. At the potential minima, the bond lengths are 1.314 Å for NF_3^+, 1.341 Å for CF_3, and 1.442 Å for BF_3^-; the complements of the umbrella angles are +12.1° for NF_3^+, +17.1° for CF_3, and +19.6° for BF_3^-. Calculated inversion barriers are about 11, 33, and 28 kcal/mol for NF_3^+, CF_3, and BF_3^-, respectively. Bonding and the predicted dependence of EPR parameters upon radical geometry are discussed. With respect to the spin-density distribution and the radical geometry, these calculations confirm the general inferences drawn from the previous EPR analysis—in particular, the hyperfine interaction of the central atom. However, an experimental ambiguity in orientation of the principal axis of the fluorine hyperfine coupling matrix is resolved in favor of the nonintuitive alternative. It is concluded that quantitative information about the geometry of such radicals cannot be inferred from the orientation of the halogen hyperfine axes. (27 refs.)

100238 Molecular and electronic structure of phosphonium cyclopropylide ($H_3P{=}C(CH_2)_2$): a theoretical study. M.A.Vincent, H.F.Schaefer,III (Dept. of Chem., Univ. of California, Berkeley, CA, USA), A.Schier, H.Schmidbaur.
J. Am. Chem. Soc. (USA), vol.105, no.12, p.3806-11 (15 June 1983).
Theoretical studies have been carried out for a phosphonium cyclopropylide model, $H_3P{=}C(CH_2)_2$. The molecule was shown to have a ground-state equilibrium geometry (structure I) with a pyramidal carbanion center. One of the PH_3 hydrogen atoms is affected by the carbanion (partial) negative charge, and its position shows substantial distortion away from the idealized tetrahedral phosphorus geometry. In the energy profile for the carbanion inversion the stationary point of maximum energy (two imaginary vibrational frequencies) occurs not for the planar carbanion configuration but well beyond in a situation with a dihedral angle H0PC1C2 of 123° instead of 90°. The rotated configuration (a genuine transition state) is virtually the eclipsed analogue of structure I. The barriers to inversion and rotation are predicted to be 6.3 and 5.8 kcal, respectively. Calculated bond distances, bond angles, dihedral angles, total energy values, and total electron populations on atoms are given for all three conformations. Atomic orbital components and energies of frontier orbitals of the ground state are also discussed. (22 refs.)

100239 An experimental and ab initio study of the addition of atomic carbon to water. S.N.Ahmed, M.L.McKee, P.B.Shevlin (Dept. of Chem., Auburn Univ., Auburn, AL, USA).
J. Am. Chem. Soc. (USA), vol.105, no.12, p.3942-7 (15 June 1983).
The theoretical study, in which all geometries were optimized at 3-21 G level and single point calculations performed at the UMP3/6-31G** level, involved both ^1D and ^3P states of carbon. For $C(^1D)$ atoms, the process having the lowest activation enthalpy is cleavage of an initially formed carbon-water complex to CO and H_2 along a closed-shell surface ($\Delta H\ddagger = 5.2$ kcal/mol). Rearrangement of the closed-shell carbon-water complex to hydroxymethylene has $\Delta H\ddagger = 11.6$ kcal/mol. In the case of triplet carbon, the most favorable reaction of the initial carbon-water complex was simply dissociation to $C+H_2O$. The $\Delta H\ddagger$ for rearrangement of the $C(^3P)$-H_2O complex to hydroxymethylene was 22.8 kcal/mol while the corresponding barrier for an open-shell singlet complex was 18.0 kcal/mol. The barrier to rearrangement of singlet hydroxymethylene to formaldehyde (38.9 kcal/mol) and that of triplet hydroxymethylene (41.3 kcal/mol) were similar. The experimental results were in agreement with theoretical predictions. Atomic carbon, generated by the thermolysis of 5-diazotetrazole, reacts with water to give carbon monoxide (9.5%) and formaldehyde (2.4%). Addition of O_2, a scavenger of $C(^3P)$, increases the CO yield to 53.7% while leaving the formaldehyde yield unchanged. Reaction of carbon with O_2 alone produces only CO (47%). These results indicate that the state of carbon reactive toward water is a singlet, as indicated by the calculations. (28 refs.)

100240 Molecular properties from MCSCF-SCEP wave functions. I. Accurate dipole moment functions of OH, OH^- and OH^+. H.-J.Werner, P.Rosmus, E.-A.Reinsch (Fachbereich Chem., Univ. Frankfurt, Frankfurt, Germany).
J. Chem. Phys. (USA), vol.79, no.2, p.905-16 (15 July 1983).
Potential energy and dipole moment functions for the ground states of OH, OH^- and OH^+ have been calculated from MCSCF, MCSCF-SCEP and SCEP-CEPA electronic wave functions. The stability of the dipole moments with respect to the number of configurations (up to 598) and orbitals (up to 14) simultaneously optimised in the MCSCF procedure and the number of reference configurations (up to 11) in the MCSCF-SCEP wave functions (up to 69830 configurations) has been investigated. The dipole moment functions obtained from the best electronic wave functions are more accurate than all previously calculated ones. The deficiencies of the former calculations have been critically analysed. The OH^- and OH^+ ions are predicted to be stronger IR emitters than the neutral OH radical. The rotationless rates of spontaneous emission A_0^1 for the fundamental transitions are calculated to be 12.2, 137, and 263 s^{-1} for OH, OH^-, and OH^+, respectively. The calculated dipole moments in the vibrational ground states are 1.65, 1.04, and 2.32 D, respectively. (51 refs.)

100241 Determination of Slater-Condon and Trees parameters in terms of the exact effective valence shell Hamiltonian. J.J.Oleksik, K.F.Freed (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA).
J. Chem. Phys. (USA), vol.79, no.3, p.1396-403 (1 Aug. 1983).
The empirical approximate Slater-Condon and Trees parameters of atomic spectra and semiempirical molecular electronic structure theories are expressed in terms of the matrix elements of the exact effective valence shell Hamiltonian ($\mathcal{H}^v$) for the s^np^m case. The nature of the configuration and occupation dependence of the Slater-Condon and Trees parameters is thereby made explicit by their representation in terms of exact configuration and occupation independent $\mathcal{H}^v$-matrix elements. Ab initio values of the latter for oxygen and nitrogen ions are utilized to provide ab initio Slater-Condon and Trees parameters for these systems. (15 refs.)

100242 An ab initio SCF calculation of the polarizability tensor of sulphur dioxide. G.G.Bacskay (Dept. of Theoretical Chem., Univ. of Sydney, Sydney, NSW, Australia).
J. Chem. Phys. (USA), vol.79, no.4, p.2090-2 (15 Aug. 1983).
The results of an ab initio Hartree-Fock SCF calculation of the static polarizability ($\lambda=\infty$) are presented which are believed to be sufficiently accurate to determine the sign of α_{xx}-$\bar{\alpha}$ and decide in favor of one of Murphy's assignment for the polarizability tensor. In agreement with Murphy's choice, the sign of α_{xx}-$\bar{\alpha}$ is found to be negative. (25 refs.)

100243 On H_2^+ for small internuclear separation. M.Klaus (Dept. of Math., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).
J. Phys. A (GB), vol.16, no.12, p.2709-20 (21 Aug. 1983).
The author studies the behaviour of the electronic energy $E(R)$ of the hydrogen molecular ion as the internuclear separation R goes to zero. He proves that $E(R)$ is not analytic at $R=0$ and he finds its expansion in terms of powers of R and R^2 ln R up to order $R^9(\ln R)^3$. This rigorously justifies earlier work by Byers Brown and Steiner (1966). He also gives an outline of how one can prove non-analyticity by means of a perturbation treatment based on the united atom. (13 refs.)

100244 Bohr orbit theory revisited. I. Ground-state energies for the helium isoelectronic sequence. R.D.Harcourt (Dept. of Phys. Chem., Univ. of Melbourne, Parkville, Victoria, Australia).
J. Phys. B (GB), vol.16, no.15, p.2647-57 (14 Aug. 1983).
The (non-relativistic) ground-state energies for H^-, He, Li^+, C^{4+} and Ne^{8+} are calculated using the 1913 orbit model of Bohr for a two-electron atomic system, modified so that the electrons are able to move away from Bohr's 180° arrangement of them around the orbit. Both classical and non-classical weighting factors ($(P(\phi))$) are associated with the energy $E(\phi)$ for angle ϕ. If ϕ is restricted so that $E(\phi)$ cannot exceed the energy of He^+, then the calculated average energies $\bar{E}$ for He(-2.900 or -2.908 au, with classical and non-classical $P(\phi)$) are much closer to the exact energy (-2.9037 au) than is Bohr's estimate (-3.0625 au). Similar calculations for H^- and the isoelectronic cations give values for $\bar{E}$ that are respectively rather less than and greater than the exact energies. For H^-, with a classical $P(\phi)$, a simple further modification gives $\bar{E}=-0.52793$ au; the exact energy is -0.52775 au. For He, Ne^{8+} and Ca^{18+} the results of approximate calculations are also reported, which allow for the possibility that the two electrons move around separate orbits when ϕ is small. Relationships are developed between the orbit and orbital models for the ground states of two-electron systems. (16 refs.)

100245 Electronic transition dipole moment functions and difference potentials for transitions among low-lying states of Li_2 and Na_2. D.D.Konowalow, M.E.Rosenkrantz, D.S.Hochhauser (Dept. of Chem., State Univ. of New York, Binghamtom, NY, USA).
J. Mol. Spectrosc. (USA), vol.99, no.2, p.321-38 (June 1983).
Electronic transition dipole moment functions based on ab initio multiconfiguration self-consistent field wavefunctions are computed for the transitions $^1\Sigma_u^+$-$^1\Sigma_g^+$, $^3\Sigma_g^+$-$^3\Sigma_u^+$, $^1\Pi_u$-$^1\Sigma_g^+$, $^3\Pi_g$-$^3\Sigma_u^+$, $^1\Sigma_u^+$-$^1\Pi_g$, $^3\Sigma_g^+$-$^3\Pi_u$, $^1\Pi_u$-$^1\Pi_g$, and $^3\Pi_g$-$^3\Pi_u$ in Li_2 and Na_2. (In each case the states are the lowest lying of their symmetry). The authors also calculate the matrix element $\langle ^3\Sigma_u^+ | i(L_x$-$iL_y) | ^3\Pi_u \rangle$ for the predissociation of the $^3\Pi_u$ state by the $^3\Sigma_u^+$ state. Several unobserved spectral features are predicted. (36 refs.)

100246 The first valence states of the SO^+. Ion rotational analysis of the $A^2\Pi_i$-$X^2\Pi_r$ and $b^4\Sigma^-$-$a^4\Pi_i$ transitions. Comparison of experimental and ab initio calculated molecular parameters. D.Cossart (Lab. de Photophys. Moleculaire, CNRS, Univ. de Paris-Sud, Orsay, France), H.Lavendy, J.M.Robbe.
J. Mol. Spectrosc. (USA), vol.99, no.2, p.369-406 (June 1983).
Rotational analysis has been carried out for the first time for bands of the $A^2\Pi_i$-$X^2\Pi_r$ system of the SO^+ ion, as well as for newly discovered bands of the $b^4\Sigma^-$-$a^4\Pi$ transition of the same ion. At the same time, ab initio calculations were performed using the SCF method followed by configuration interaction. Theoretical results are presented as required for interpretation of the spectra. Important spin-orbit interactions are shown to occur between the four $X^2\Pi_r$, $A^2\Pi_i$, $a^4\Pi_i$, and $b^4\Sigma^-$ states and neighboring unobserved states. (43 refs.)

100247 The ab initio gradient revolution in structural chemistry: the importance of local molecular geometries and the efficacy of joint quantum mechanical and experimental procedures. L.Schafer (Dept. of Chem., Univ. of Arkansas, Fayetteville, AR, USA).
J. Mol. Struct. (Netherlands), vol.100, p.51-73 (July 1983).
The use of ab initio gradient calculations to determine structural information is reviewed. The significance of local geometries is discussed. Many calculated structural trends in local geometries are often unobservable by direct quantitative experimental techniques, presenting a challenge to develop more powerful experimental methods. The applications of calculated structural data in interpreting experimental results in microwave spectroscopy and electron diffraction are discussed. (64 refs.)

100248 Symmetry of Kekule structures. S.J.Cyvin (Div. of Phys. Chem., Univ. of Trondheim, Trondheim, Norway).
J. Mol. Struct. (Netherlands), vol.100, p.75-85 (July 1983).
The symmetry of Kekule structures for aromatic hydrocarbons is studied by group theory. The general problem of deducing the distribution over irreducible representations (Γ_{Kek}) or characters of the representation based on the Kekule structures (χ_{Kek}) has not been solved. A partial solution is given for two classes of molecules, namely (a) the 'straight chain' aromatics (polyacenes): naphthalene, anthracene, naphthacene etc., and (b) the 'zig-zag chain' aromatics: phenanthrene, chrysene, picene, etc. As a part of this solution the number of Kekule structures (K) in the two cases was found to be a (a) $K=Q+1$ and (b) $K=F_{Q+1}$, respectively. Here Q is the number of benzene rings in the molecule in question, and F_i denotes the i-th member of the Fibonacci series. Symmetrical structures (Γ_{Kek}) or characters (χ_{Kek}) are given for a number of additional molecules as examples: benezene (D_{6h}), tetraphene (C_s), benzo[c]phenanthrene (C_{2v}), pyrene (D_{2h}), triphenylene (D_{3h}), perylene (D_{2h}), pentaphene (C_{2v}), dibenzophenanthrene (C_{2v}), heptaphene (C_{2v}) and coronene (D_{6h}). Here the appropriate symmetry groups are given in parentheses. (7 refs.)

100249 Structural determination of recalcitrant molecule (S_2F_4). M.V.Carlowitz, H.Oberhammer (Inst. fur Phys. und Theoretische Chem., Tubingen, Germany), H.Willner, J.E.Boggs.
J. Mol. Struct. (Netherlands), vol.100, p.161-77 (July 1983).
The structure determination of S_2F_4 (or SF_3SF), the dimer of SF_2, is made difficult by the large variety of possible conformers and the instability of the compound. An electron diffraction and microwave study succeeded only with the help of a molecular model derived from ab initio calculations, after initial experimental attempts had failed. The force field required for a joint electron diffraction and microwave spectroscopy analysis was calculated by ab initio methods and adjusted to the experimental vibrational frequencies. The structure of S_2F_4 is a trigonal bipyramide with the electron lone pair, the SF group and one fluorine atom in equatorial positions. The SF_3 group is strongly distorted with the two axial S-F bonds differing by 0.10 Å and bond angles between axial bonds and equatorial plane of about 77° and 92°, respectively. The geometric structure of S_2F_4 in combination with the ab initio calculations allows one to visualize the dissociation process $SF_3SF \rightarrow 2\ SF_2$ more clearly. (32 refs.)

100250 A suggested revised conformation of methylthionitrite as seen by its spectra and preliminary ab initio calculations. B.Bak, N.Kristiansen (Chem. Lab. V, Univ. of Copenhagen, Copenhagen, Denmark), H.Johansen.
J. Mol. Struct. (Netherlands), vol.100, p.453-8 (July 1983).
A proof has recently been given that gaseous methylthionitrite, CH_3SNO, occurs exclusively (or mainly) in its anti conformation. The author claims that existing spectral evidence and ab initio calculations now performed suggest that gaseous methylthionitrite is mainly the syn conformer, the extra stability being of the order 1-2 kcal mol^{-1}. Methyl group rotation in the syn conformer is hindered by a three-fold barrier of height 689 cm^{-1} while the methyl group rotation in the anti conformer is hardly hindered. The syn/anti energy difference and the barriers hindering methyl group rotation closely parallel the corresponding measured quantities in methylnitrite, CH_3ONO. (19 refs.)

100251 Analytical relativistic wave functions for two-electron atoms and ions. V.F.Trusov.
Latv. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR), no.3, p.3-5 (1983). In Russian.
Relativistic radial wave function is constructed as a linear combination of Slater type basic orbitals. In contrast to the nonrelativistic version, factors depending on nonlinear parameters have been introduced. These factors are similar to those contained by the hydrogen-like relativistic ground-state function. It is shown, that the energy functional has a minimum in respect to such functions. (4 refs.)

100252 Resonance of an unshared electron pair between two atoms connected by a single bond. L.Pauling (Linus Pauling Inst. of Sci. & Medicine, Palo Alto, CA, USA).
Proc. Natl. Acad. Sci. USA, vol.80, no.12, p.3871-2 (June 1983).
The reported structure of the dimer of a compound of bicovalent tin indicates that the tin-tin bond is of a new type. It can be described as involving resonance between two structures in which there is transfer of an electron pair from one tin atom to the other. The tin atoms are connected by a single covalent bond (each also forms two covalent bonds with carbon atoms), and an unshared electron pair resonates between the fourth sp^3 orbitals of the two atoms. Similar structures probably occur in digermene and distannene. (8 refs.)

100253 Variational fit to the nonlocal electron-electron exchange potential: is an accurate N^3 Hartree-Fock method possible?. B.I.Dunlap (Naval Res. Lab., Washington, DC, USA).
Phys. Rev. Lett. (USA), vol.51, no.7, p.546-9 (15 Aug. 1983).
A variational method for fitting the Hartree-Fock exchange potential is investigated. The method has properties similar to an earlier method that successfully treats the direct part of the electron-electron Coulomb interaction in density-functional calculations. The present method is tested on atomic neon and should permit reliable linear combination of atomic orbital Hartree-Fock molecular calculations that grow in complexity only as the cube of the number of basis orbitals. (11 refs.)

100254 Nonadiabatic generator-coordinate calculation of H_2^+. J.G.Ribeiro Tostes (Inst. de Quimica, Univ. Estadual de Campinas, Campinas, Sao Paulo, Brazil), A.F.R.de Toledo Piza.
Phys. Rev. A (USA), vol.28, no.2, p.538-43 (Aug. 1983).
The authors report on a nonadiabatic calculation of the few lowest $J=0$ states in the H_2^+ molecule done within the framework of the generator-coordinate method. Substantial accuracy is achieved with the diagonalization of matrices of very modest dimensions. The resulting wave functions are strongly dominated by just a few basis states. The computational scheme is set up so as to take the best advantage of good analytical approximations to existing adiabatic molecular wave functions. (26 refs.)

100255 Emissive zones of complex atomic configurations in highly ionized atoms. J.Bauche, C.Bauche-Arnoult, E.Luc-Koenig, J.-F.Wyart (Lab. Aime Cotton, CNRS, Orsay, France), M.Klapisch.
Phys. Rev. A (USA), vol.28, no.2, p.829-35 (Aug. 1983).
The radiative properties of very complex atomic configurations in highly ionized species can be determined easily by means of statistical moments, computed ab initio from relativistic radial orbitals. A case of current interest, the spectrum of GdXII, is studied as an example. The locations and the widths of the zones of the upper configurations responsible for the bulk of the spontaneous emission are determined formally and numerically. The fact that these zones may sometimes lie well above the center of gravity of the configuration can be interpreted by considering the relevant $G^1(nl,n'l-1)$ Slater integral and its angular coefficients. Moreover, it is shown that two transition arrays involving the same upper configuration may actually originate from disconnected zones of the latter. A linear relationship is established formally between the coefficients of $G^1(nl,n'l-l)$ and the J-file sums of Condon and Shortley. This gives the authors the opportunity to evaluate the sum of the line strengths of all the transitions originating from a given upper level and, therefore, a method for checking oscillator-strength angular calculations. (16 refs.)

100256 Structure of the nitrite ion. J.D.Goddard, M.L.Klein (Div. of Chem., Nat. Res. Council of Canada., Ottawa, Ontario, Canada).
Phys. Rev. A (USA), vol.28, no.2, p.1141-3 (Aug. 1983).
Ab initio self-consistent-field calculations with large polarized basis sets have been used to determine the optimized geometry of an isolated nitrite ion. Similar calculations, performed for a nitrite ion interacting with either one or two sodium ions, suggest that only modest differences in geometry will occur when a nitrite ion is placed in an interactive environment. This finding appears to contradict an analysis of the absolute photodetachment spectrum of NO_2^- which indicates that in the gas phase the N-O bond length is 8% shorter than in the sodium nitrite crystal. (23 refs.)

100257 Semiclassical parametrization of the 6snh-6sni-6snk intervals in BaI. L.J.Curtis, P.S.Ramanujam, C.E.Theodosiou (Dept. of Phys. & Astron., Univ. of Toledo, Toledo, OH, USA).
Phys. Rev. A (USA), vol.28, no.2, p.1151-3 (Aug. 1983).
A semiclassical core-polarization-penetration model is used to parametrize the 6snh-6sni and 6sni-6snk intervals in BaI which were recently measured by Gallagher, Kachru, and Tran. The parametrization represents the existing data to within experimental uncertainties, and extrapolative predictions along these Rydberg series are presented. (20 refs.)

100258 Calculation of the ground and excited states of the Ne_2 molecule by the variational cellular method. A.M.Dias (Dept. de Fisica e Matematica, Fundacao de Ensino e Tecnologia de Alfenas, Alfenas, Brazil), A.Rosato.
Rev. Bras. Fis. (Brazil), vol.12, no.2, p.315-23 (June 1982).
The potential curves for the ground $^1\Sigma_g^+$ and for the first singlet excited state $^1\Sigma_u^+$ of the Ne_2 molecule are determined by the variational cellular method. From these curves some spectroscopic constants are obtained. Ionization energies of the excited state $^1\Sigma_u^+$ are calculated. (19 refs.)

100259 Symmetry breakdown in Hartree-Fock: localised solutions in molecules. S.Canuto (Dept. de Fisica, Univ. Federal de Pernambuco, Recife, Brazil).
Rev. Bras. Fis. (Brazil), vol.12, no.3, p.459-72 (Sept. 1982). In Portuguese.
In Hartree-Fock theory the wave function is obtained variationally and the lowest energy solution does not necessarily reflect the total symmetry of the Hamiltonian. There from, through symmetry breakdown, it is possible to incorporate important correlation effects into the independent particle model. In the case of spatial symmetry they allow the molecular orbitals to transform according to the irreducible representation of a strategic sub-group of the total symmetry group of the molecule. This may lead to ionization and to local excitations. These aspects are discussed starting from several ab initio ΔE_{SCF} calculations for excitations n-π^* and π-π^*, as well as ionizations, both in deep and valence shells. (43 refs.)

31.20E Ab initio LCAO and GO SCF calculations

100260 Ab initio calculation of equilibrium geometry and hyperfine coupling constants of the cyclopentane cation. M.B.Huang, S.Lunell (Dept. of Quantum Chem., Uppsala Univ., Uppsala, Sweden), A.Lund.
Chem. Phys. Lett. (Netherlands), vol.99, no.3, p.201-5 (5 Aug. 1983).
The equilibrium geometry and hyperfine coupling constants of the cyclopentane cation have been calculated by the UHF method, within the ab initio MO LCAO SCF approximation. A non-planar carbon framework of C_s symmetry was found with one carbon atom out of the plane of the others. The geometry and the calculated isotropic constants give support to the ESR identification of the ion. (15 refs.)

100261 Proton affinities of GeH_4 and SiH_4. II. Calculations of the proton affinity of GeH_4 in terms of extended basis sets. S.Sudoh, O.Nomura, S.Ikuta, S.Katagiri, M.Imamura.
Rep. Inst. Phys. & Chem. Res. (Japan), vol.59, no.3, p.71-8 (1983). In Japanese.
The proton affinity of GeH_4 is calculated by the ab initio LCAO-MO SCF method using various basis sets: MIDI-1′-A, MIDI-1-B, CGTO-A and CGTO-C. The structure of the protonated germane (GeH_5^+) was found to be of a C_s symmetry. The germyl cation (GeH_3^+) interacts weakly with a hydrogen molecule (H_2) in the protonated germane. All the basis sets give the C_s structure. The result well explains the elusive nature of GeH_5^+ and the proton affinity of germane, but is not in conformity with the assertion of the symmetry (D_{3h}) proposed by Hartmann et al. (15 refs.)

31.20L Statistical model calculations (Thomas-Fermi and Thomas-Fermi-Dirac models)

100262 Thomas-Fermi theory in a weak, slowly varying vector potential. R.A.Harris, J.A.Cina (Dept. of Chem., Univ. of California, Berkeley, CA, USA).
J. Chem. Phys. (USA), vol.79, no.3, p.1381-3 (1 Aug. 1983).
The gauge invariant kinetic energy of an inhomogeneous electron gas in the presence of a weak, slowly varying vector potential is determined by a generalization of Schwinger's method. The kinetic energy is a function of the charge density and current density. The resulting energy should prove useful in determining the linear responses of closed shell systems to magnetic fields. (24 refs.)

31.20N Semi-empirical NDO calculations (CNDO, INDO, MINDO, PCILO methods, etc.)

100263 Development and status of MINDO/3 and MNDO. M.J.S.Dewer (Dept. of Chem., Univ. of Texas, Austin, TX, USA).
J. Mol. Struct. (Netherlands), vol.100, p.41-50 (July 1983).
The historical development of MINDO/3 and MNDO is outlined in relation to the parallel developments of the ab initio SCF approach. It is pointed out that both treatments are purely empirical so far as chemistry is concerned and complement one another, MINDO/3 and MNDO allowing calculations to be carried out when ab initio methods of comparable performance are inapplicable because they need one-thousand times more computing time. (38 refs.)

31.20T Electron correlation and CI calculations

100264 The evaluation of two-photon absorptivities in molecules in the adiabatic approximation by CI expansion. G.L.Bendazzoli, A.Degli Esposti, S.Evangelisti, P.Palmieri (Istituto di Chimica Fisica e Spettroscopia, Univ. di Bologna, Bologna, Italy).
Chem. Phys. Lett. (Netherlands), vol.99, no.3, p.266-70 (5 Aug. 1983).
The authors stress the advantages of solving directly the equations of perturbation theory by CI expansion instead of using the sum-over states formulation of two-photon absorption. A formula to compute the matrix element entering the expression for the cross section taking into account the nuclear degrees of freedom is derived from the Karplus-Kolker variational principle. Numerical applications to H_2 are presented. (17 refs.)

100265 Intermolecular potentials for the H_2O-C_6H_6 and the C_6H_6-C_6H_6 systems calculated in an ab initio SCF CI approximation. G.Karlstrom, P.Linse, A.Wallqvist, B.Jonsson (Chem. Center, Lund, Sweden).
J. Am. Chem. Soc. (USA), vol.105, no.12, p.3777-82 (15 June 1983).
Ab initio SCF CI potentials have been calculated for the H_2O-C_6H_6 and the C_6H_6-C_6H_6 systems. The interaction energy is decomposed into contributions that could be given a physical interpretation. It is shown that it is necessary to obtain good estimates for each of these contributions in order to obtain a reliable potential. The calculated potentials are fitted to analytical forms, and the second virial coefficient for the C_6H_6-C_6H_6 system as well as the cross virial coefficient for the C_6H_6-H_2O system is calculated. (40 refs.)

100266 Electronic structure and orbital interactions in linear PtCO. H.Basch, D.Cohen (Dept. of Chem., Bar-Ilan Univ., Ramat Gan, Israel).
J. Am. Chem. Soc. (USA), vol.105, no.12, p.3856-60 (15 June 1983).
The electronic and geometric structural properties of linear PtCO have been investigated by using an ab initio *l*-dependent relativistic effective core potential for Pt within the framework of the multiconfiguration self-consistent field and configuration interaction methods. The energy ordering of electronic states is $^1\Sigma^+ < (^3\Sigma^+, ^3\Delta) < ^3\Pi$, where $^1\Sigma^+$ correlates with Pt $5d^{10}(^1S)$ and the triplet states arise from the Pt $5d^96s^1(^3D)$ atomic multiplet in the dissociated limits. Upon complexation with a Pt atom the loss of C=O antibonding character in the carbon lone-pair orbital dominates the decrease in π bonding due to the $Pt(5d_\pi)$-$CO(\pi^*)$ interaction. Charge transfer between the Pt and CO fragments is dominated by the CO→Pt σ dative bond at larger Pt-CO distances and by Pt→CO π-back-bonding at shorter bond lengths. The extra stability and shorter equilibrium Pt-CO bond distance of the ground $^1\Sigma^+$ state is due to nonoccupancy of the strongly antibonding σ orbital which in the triplet states has mainly Pt 6s character. This, in turn, allows a closer approach of CO to Pt and enhanced π bonding. Both $^3\Sigma$ and $^3\Delta$ are calculated to be bound on the SCF level while $^3\Pi$ has a repulsive Pt-CO energy interaction curve even with configuration interaction, apparently due to reduced π bonding in its primary electronic configuration. The $^1\Sigma^+$ state in its equilibrium geometry has a Pt atom configuration that is much closer to $5d^96s^1$ than to $5d^{10}$ while the 5d orbital population in the $^3\Delta$ state is close to 8 e. (27 refs.)

100267 Theoretical study of Jahn-Teller distortions in $C_6H_6{}^+$ and $C_6F_6{}^+$. K.Raghavachari, R.C.Haddon, T.A.Miller, V.E.Bondybey (Bell Labs., Murray Hill, NJ, USA).
J. Chem. Phys. (USA), vol.79, no.3, p.1387-95 (1 Aug. 1983).
Ab initio molecular orbital theory with the 6-31G basis set is used to study Jahn-Teller distortion effects in the benzene cation ($C_6H_6{}^+$) and the perfluorobenzene cation ($C_6F_6{}^+$), π-electron correlation is included in these calculations. Completely optimized Jahn-Teller distorted geometries are obtained for the ground electronic states of both $C_6H_6{}^+$ and $C_6F_6{}^+$. The stabilization energies resulting from these distortions are calculated for both systems. The stabilization is partitioned into contributions from C-C stretch, C-H or C-F stretch, C-C-C bend, and C-C-H or C-C-F bend coordinates. Detailed comparison is made between $C_6H_6{}^+$ and $C_6F_6{}^+$ to consider the effects of substitution. The calculated geometries and stabilization energies for $C_6F_6{}^+$ are compared to values derived from laser-induced fluorescence experiments. The overall calculated distortion parameters for $C_6F_6{}^+$ are in good agreement with the experimentally derived value. The total calculated stabilization energy ($\simeq$1000 cm^{-1}) is in good agreement with the experimental value (820$\pm\simeq$100 cm^{-1}). The individual stabilization energy contribution for the C-C stretch mode is calculated to be larger than the experimental estimate, paralleling the overestimation of the C-C bond length change for this mode. The other stabilization parameters are in reasonably good agreement with the experimental values. (24 refs.)

100268 A general method for approximating the electronic correlation energy in molecules and solids. R.Colle, O.Salvetti (Scuola Normale Superiore, Pisa, Italy).
J. Chem. Phys. (USA), vol.79, no.3, p.1404-7 (1 Aug. 1983).
A detailed analysis of a method proposed earlier for calculating a good approximation to the electronic correlation energy is presented here. The principal advantages of this method compared to the usual CI techniques are discussed. (14 refs.)

100269 Electron affinities of the alkali dimers: Na_2, K_2, and Rb_2. H.Partridge (Univ. of Southern California, University Park, Los Angeles, CA, USA), D.A.Dixon, S.P.Walch, C.W.Bauschlicher,Jr., J.L.Gole.
J. Chem. Phys. (USA), vol.79, no.4, p.1859-65 (15 Aug. 1983).
Ab initio calculations on the ground states of the alkali dimers, Na_2, K_2, and Rb_2, and their anions are reported. The calculations employ large Gaussian basis sets and account for nearly all of the valence correlation energy. The calculated atomic electron affinities are within 0.02 eV of experiment and the calculated adiabatic electron affinities for Na_2, K_2, and Rb_2 are, respectively, 0.470, 0.512, and 0.513 eV. (31 refs.)

100270 An ab initio study of core-valence correlation. H.Partridge (Univ. of Southern California, University Park, Los Angeles, CA, USA), C.W.Bauschlicher,Jr., S.P.Walch, B.Liu.
J. Chem. Phys. (USA), vol.79, no.4, p.1866-73 (15 Aug. 1983).
Including core-valence correlation ab initio CI calculations results in a contraction of the atomic valence shell, particularly for the first columns of the periodic table. In addition, including core-valence correlation improves the calculated atomic ionization potentials and the atomic energy separations. For the alkali dimers, Na_2, K_2, and Rb_2, the calculated R_es are in excellent agreement with experiment when core-valence is included. The authors find for the alkali dimers that the valence D_es are accurate. (23 refs.)

100271 The binding energy of the ground state of Be_2. B.H.Lengsfield,III, A.D.McLean, M.Yoshimine, B.Liu (IBM Res. Lab., San Jose, CA, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.1891-5 (15 Aug. 1983).
Two convergent sequences of multiconfiguration self-consistent field and configuration interaction (CI) calculations have confirmed the predictions of a previous interacting correlated fragments (ICF) calculation and given best values for the D_e and R_e of $Be_2(X^1\Sigma^+)$ of 2.04$\pm$0.21 kcal/mol and 4.73$\pm$0.03a_0, respectively. These calculations used a $6s/4p/3d/1f$ Slater basis set on each atom and correlated only the four $2s$ electrons. They were shown computationally to be free from basis set superposition and size-consistency errors. A large second order CI calculation yielded a rigorous lower bound to the full four-electron CI binding energy of 1.87 kcal/mol with the present basis set. Arguments are presented that the $1s$ electronic correlation effect on the binding energy is less than 0.2 kcal/mol. The earlier ICF calculation on Be_2 has been repeated and extended to a higher level of fragment correlation using the current basis set. The best ICF results are in close agreement with the second order CI calculations, indicating that the full four-electron CI limit within this basis set has been reached and providing the first computational proof of the convergence of ICF method. (14 refs.)

100272 Theoretical study of the lowest states of CsH and Cs_2. G.H.Jeung, F.Spiegelmann, J.P.Daudey, J.P.Malrieu (Lab. de Phys. Quantique, Univ. Paul Sabatier, Toulouse, France).
J. Phys. B (GB), vol.16, no.15, p.2659-75 (14 Aug. 1983).
The 19 lowest states of CsH and the 11 lowest states of Cs_2 have been calculated using a non-empirical relativistic effective core potential considering the caesium atom as a one-electron system. The core-valence polarisation and correlation energy has been included employing a recently developed perturbation treatment. The experimental atomic spectrum of caesium is well reproduced. The calculated energy curves show the remarkable precision of this procedure for the ground-state characteristics. For CsH, R_e=4.47 Bohr (experimental 4.71 Bohr), D_e=1.80 eV (experimental 1.83 eV), ω_e=871 cm^{-1} (experimental 891 cm^{-1}); for Cs_2, R_e=8.75 Bohr (experimental 8.78 Bohr), D_e=0.40 eV (experimental 0.45 eV), ω_e=41 cm^{-1} (experimental 42 cm^{-}). The well-to-well transition energies are in error by less than 400 cm^{-1} for experimentally known transitions. (52 refs.)

100273 Analysis of a configuration interaction calculation for a charge transfer transition in $MnO_4{}^-$. H.Johansen (Dept. of Chem. Phys., Tech. Univ. of Denmark, Lyngby, Denmark).
Mol. Phys. (GB), vol.49, no.5, p.1209-16 (10 Aug. 1983).
An analysis of the electron density distribution in the excited 1 $^1T_2$ state of the permanganate ion is presented. Based upon a configuration interaction calculation, it is shown how the charge transfer excitations lead to transfer of density from the ligands to the central atom by diagonal density matrix elements and how density is moved in the opposite direction by the off-diagonal terms, leaving the atomic charges relatively unchanged. There is, however, a large internal redistribution of the $3d$ electrons. Only a few of the configurations turn out to be very important. (6 refs.)

100274 Beyond the local-density approximation in calculations of ground-state electronic properties. D.C.Langreth, M.J.Mehl (Serin Phys. Lab., Rutgers Univ., Piscataway, NJ, USA).
Phys. Rev. B (USA), vol.28, no.4, p.1809-34 (15 Aug. 1983).
Justification, as extensive as is possible, is given for the authors' previously published nonlocal approximation for exchange and correlation. Some new exact limits for atoms and interfaces are obtained, as well as formal quantitative criteria for the validity of the local-density approximation and the gradient corrections to it. The scheme is applied to planar surface calculations, as well as to extensive self-consistent calculations at energies and densities in atoms. The results compare favorably, in every case attempted, to experimental and exact results that are available. A method is devised for separating exchange from correlation in atoms within the Kohn-Sham method (1965), and is tested favorably against exact-exchange calculations. Finally, they apply these results to atoms using exact exchange plus appropriately separated correlation expression. The results give atomic total energies to accuracies of $\sim\pm$0.01 Ry, and typically reduce the local-density-approximation error in density by an order of magnitude. (59 refs.)

31.30 CORRECTIONS TO ELECTRONIC STRUCTURE

100275 The second-order Jahn-Teller effect. R.G.Pearson (Chem. Dept., Univ. of California, Santa Barbara, CA, USA).
THEOCHEM (Netherlands), vol.12, p.25-34 (Aug. 1983).
The second-order Jahn-Teller effect is an example of reactions proceeding by an interaction between the HOMO and the LUMO within the same molecule. The consequences can be decomposition of the molecule or a structural change. First the general theory is given, and then a number of examples are presented. (15 refs.)

100276 A brief survey of the basic theoretical arguments on molecular structures and chemical bondings. G.Leroy (Lab. de Chimie Quantique, Univ. Catholique de Louvain, Louvain-la-Neuve, Belgium).
THEOCHEM (Netherlands), vol.12, p.45-56 (Aug. 1983).
The authors briefly describe some theoretical approaches to the problems of chemical binding and molecular shapes and summarize their contribution to the description of the electronic structure of chemical species. (47 refs.)

100277 A method of studying atomic screening effects in pair production. J.Bose, N.Bhattacharjee, K.Sengupta, N.Chaudhuri (Dept. of Phys., North Bengal Univ., Darjeeling, India).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.212, no.1-3, p.539-43 (1 July 1983).
A simple method to study atomic screening effects in atomic pair production has been used in measurements using 1.115 MeV photons on medium and high Z targets in the range of atomic number 29-92. Some of the results are presented and discussed. (4 refs.)

100278 Polarisation propagator approach to the dynamic nuclear electric shielding in LiH molecule. P.Lazzeretti, E.Rossi, R.Zanasi (Istituto di Chimica Organica e Centro di Calcolo Elettronico, Univ. di Modena, Modena, Italy).
J. Chem. Phys. (USA), vol.79, no.2, p.889-93 (15 July 1983).
The frequency dependence of the dipole electric polarisability and electric shielding tensors of hydrogen and lithium nuclei in the LiH molecule has been studied via some approximations to the polarisation propagator method, i.e. STA, TDA, and RPA, allowing for dipole length, velocity, acceleration, and mixed formalisms. The RPA nuclear electric shieldings are in a fairly good agreement with the corresponding experimental data, a discrepancy being observed for the parallel component at the Li nucleus. (33 refs.)

100279 A note about a systematic study of the electrostatic potential at the nucleus and the interelectronic interaction in the atoms and ions. E.A.Castro, F.M.Fernandez (INIFTA, Seccion Quimica Teorica, La Plata, Argentina).
J. Chem. Phys. (USA), vol.79, no.3, p.1548-9 (1 Aug. 1983).
In the course of a systematic study of Politzer's energy relations (1976) for the free atoms and ions by using Clementi's near Hartree-Fock data, (1974) Teruya and Anno have obtained systematic sets of data on the interelectronic repulsion V_{ee} and on the nuclear electronic interaction V_{Ne}. $DV_{O,A}$ and DV_{ee}, the difference in $V_{O,A}$ and V_{ee} between two successive members of a given isoelectronic series, respectively, change monotonically for a given isoelectronic series of atoms and approach to a limiting value. Teruya and Anno explained this behavior by noting the fact that *AO*'s of an atom with a given number of electrons approach the hydrogenic *AO*'s when $Z \rightarrow \infty$ and that the general pattern of $DV_{O,A}$ or DV_{ee} curves can be accounted for from Slater's simple model (1930) involving the data of screening effect due to other electrons within the atom if the dependence of the screening constants upon ionic charge is assumed. The authors discuss the change of $DV_{O,A}$ and DV_{ee} for a given isoelectronic series, from an alternative point of view. Such analysis is based upon the Linderberg Z-perturbation treatment of the Hartree-Fock equations (1961). (17 refs.)

100280 Relativistic effects in Cu_2 bonding. M.Pelissier (Lab. de Phys. Quantique, Univ. Paul Sabatier, Toulouse, France).
J. Chem. Phys. (USA), vol.79, no.4, p.2099-100 (15 Aug. 1983).
In a recent paper Bauschlicher, Walch, and Siegbahn (ibid., vol.76, p.6015, 1982) attributed the difference between their ab initio computed bond length and the experimental value to relativistic effects. The bond length was found 0.15 bohr longer than experiment, which is consistent with the 0.064 bohr relativistic contraction of the 4*s* orbital. The author tries to clarify the role of relativistic contributions to the Cu_2 bonding. A better agreement with experimental values is obtained by using an effective core potential (ECP) to account for the effects of 1*s*, 2*s*, 3*s*, and 3*p* electrons. (6 refs.)

100281 The 2^3S-2^3P_J, $J=0$, 1, 2 intervals in neutral helium. J.Hata, I.P.Grant (Dept. of Theoretical Chem., Oxford, England).
J. Phys. B (GB), vol.16, no.15, p.L433-6 (14 Aug. 1983).
A recent comparison of theory and experiment by Juncar and co-workers (1983) suggested residual errors in the theory due to non-relativistic correlation energy and to radiative corrections. A careful analysis shows that theory and experiment agree to within the experimental limits, 5×10^{-4} cm^{-1}. (16 refs.)

100282 Precision determination of the nuclear *g* factor of $^{39}K^+$ ion and diamagnetic shielding constant difference between a ^{39}K atom and a $^{39}K^+$ ion. E.I.Obiajunwa, S.A.Adebiyi, E.A.Togun, A.F.Oluwole (Dept. of Phys., Univ. of Ife, Ile-Ife, Nigeria).
J. Phys. B (GB), vol.16, no.15, p.2733-5 (14 Aug. 1983).
An optical pumping charge exchange collision experiment for precise measurement of the nuclear g factor of the $^{39}K^+$ ion in a helium buffer gas is reported. $^{39}K^+$ ions are polarised by charge exchange collisions with oriented ^{39}K atoms. The NMR frequencies of $^{39}K^+$ and the ESR frequencies of free electrons polarised by oriented ^{39}K atoms are measured in a magnetic field (3-34 G). This gives the ratio of the nuclear g factor of the $^{39}K^+$ ion to the electronic g factor of free electrons to be: $g_I(^{39}K^+)/g_e=0.07088733\ (17) \times 10^{-3}$. Using this ratio together with the best available measured values of $g_e=2.0023193134\ (70)$ and $g_I(^{39}K)=1.4193489\ (12) \times 10^{-4}$ the authors obtain: (i) $g_I(^{39}K^+)=-1.4193906\ (34) \times 10^{-4}$ in units of the Bohr magneton; (ii) the diamagnetic shielding constants difference between free atoms and ions is: $\sigma(^{39}K^+)-\sigma(^{39}K)=-29(6) \times 10^{-6}$. (12 refs.)

100283 Vacuum polarization corrections and spin-orbit splitting in antiprotonic atoms. E.Borie (Inst. fur Kernphys., Univ. Karlsruhe, Karlsruhe, Germany).
Phys. Rev. A (USA), vol.28, no.2, p.555-8 (Aug. 1983).
Precise calculations of the energy levels and fine structure of antiprotonic atoms, in which the normal and anomalous magnetic moments of the antiproton are treated on an equal basis and vacuum polarization and relativistic recoil corrections are included, are presented. The results are applied to measurements of the antiproton mass and anomalous magnetic moment with the use of antiprotonic atoms. (15 refs.)

100284 Further studies of the promethium isoelectronic sequence. C.E.Theodosiou, V.Raftopoulos (Dept. of Phys. & Astron., Univ. of Toledo, Toledo, OH, USA).
Phys. Rev. A (USA), vol.28, no.2, p.1186-8 (Aug. 1983).
The authors have performed a fully relativistic calculation, using the Dirac-Fock approximation, of energy levels and excitation energies for several ions in the promethium isoelectronic sequence. The results verify the overall predictions on level ordering of the Hartree-Fock calculations, which included some relativistic effects perturbatively. Some differences were found concerning the atomic number at which the ground state of the ion has alkali-metal-like configurations. (8 refs.)

100285 Nuclear moments and isotope shifts of europium isotopes by hyperfine structure investigations with collinear laser-ion beam spectroscopy. K.Dorschel, W.Heddrich, H.Huhnermann, E.W.Peau, W.Wagner (Fachbereich Phys., Marburg, Germany), G.D.Alkhazov, E.Ye.Berlovich, V.P.Denisov, V.N.Panteleev, A.G.Polyakov.
Z. Phys. A (Germany), vol.312, no.3, p.269-70 (1983).
Hyperfine structures and isotope shifts of the transition $4f^7(^8S_{7/2}{}^0)6p_{3/2}(7/2,3/2)_4$-$4f^7(^8S_{7/2}{}^0)$ 5d $^9D_4{}^0$, $\lambda=604.95$ nm, of stable ^{151}Eu and ^{153}Eu and radioactive ^{152}Eu and ^{154}Eu have been investigated by collinear laser-ion beam spectroscopy. Nuclear quadrupole moments have been derived. (5 refs.)

31.50 EXCITED STATES

100286 Molecular Rydberg transitions. A.N.Singh, R.S.Prasad (Dept. of Phys., Magadh Univ., Bihar, India).
Indian J. Phys. Part B, vol.57B, no.1, p.40-50 (Feb. 1983).
Rydberg states in molecules calculated under semi-empirical SCF-MO theoreis RCNDO/S and RINDO/S are presented. The most prominent Rydberg states as well as the admixture of valence and Rydberg states are discussed. In addition, the paper is provided with experimental correlation for these states. (33 refs.)

100287 Effect of crossed electric and magnetic fields on sodium Rydberg states. E.Korevaar, M.G.Littman (Dept. of Mech. & Aerospace Engng., Princeton Univ., Princeton, NJ, USA).
J. Phys. B (GB), vol.16, no.15, p.L437-42 (14 Aug. 1983).
The excitation spectrum for Rydberg states near $n=11$ of atomic sodium in crossed electric and magnetic fields has been recorded. The theoretical analysis of the spectroscopic data reveals degeneracies among some sublevels even though different sublevels are mixed by the external fields. The degeneracies are traced to a dynamical symmetry that is characteristic of the Coulomb potential. (19 refs.)

100288 Laser absorption measurements of atomic metastable densities. D.M.Kane, M.H.Dunn (Dept. of Phys., Univ. of St. Andrews, St. Andrews, Scotland).
J. Phys. B (GB), vol.16, no.15, p.2709-19 (14 Aug. 1983).
Helium triplet metastable densities have been calculated from measured absorption of resonant, CW, UV laser radiation on the 2^3S-5^3P transition at 294.511 nm. Gas temperatures have also been deduced by measuring the Doppler width of this transition. A 3 mm bore capillary tube filled to pres-

sures in the range 1-8 Torr and run at currents in the range 2.5-80 mA was studied. With constant discharge current (60 mA) at a maximum value for the triplet metastable density of 11×10^{12} cm^{-3} at about 2 Torr was obtained. The metastable densities show the expected saturation behaviour, saturating at currents above 40 mA. Experimental values are used in conjunction with the rate equation describing the metastable level population in order to estimate the rate coefficient for loss of metastables through electron collisions. Mention is made of the use of the visible laser radiation for measuring the UV laser wavelength in a Kowalski-type wavemeter. (16 refs.)

100289 Doubly excited states of the C^{3+} ion. A.V.Kuplyauskene, Z.J.Kuplyauskis.
Opt. & Spectrosc. (USA), vol.54, no.1, p.26-9 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.48-53 (Jan. 1983).
The energies of the 44 lowest doubly excited states of C^{3+} are determined by the method of superposition of configurations. The autoionization widths and the probabilities of autoionization of nine doublet terms are presented. A calculation of the wavelengths and transition probabilities of the satellites is carried out for the $1s^2\ {}^1S\text{-}1s2p\ {}^1P$ resonance line of the C^{4+} ion. (23 refs.)

100290 Capture of radiation in complex configuration volumes. V.I.Denisov, N.G.Preobrazhenskii.
Opt. & Spectrosc. (USA), vol.54, no.1, p.40-3 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.73-8 (Jan. 1983).
Radiative de-excitation of excited atoms from the volume occupied by gas or plasma which is not convex (a hollow cylinder, a torus) is considered. A method based on the self-modeling property of the Biberman-Holstein problem is used which allows the authors in calculating radiation characteristics, to express explicitly the dependence of the characteristics of radiation on the optical thickness of the layer. The geometrical form factor is found using statistical modeling. The systematic errors of the method and the correct choice of the assumed mean free path of a photon inside the radiating layer are studied. (8 refs.)

100291 Multichannel quantum-defect analysis of the bound even-parity spectrum of neutral barium. M.Aymar, P.Camus (Lab. Aime Cotton, CNRS, Orsay, France).
Phys. Rev. A (USA), vol.28, no.2, p.850-7 (Aug. 1983).
Extensive new data on the bound even-parity spectrum of neutral barium have been provided recently by two-step optogalvanic spectroscopy. Highly excited members of the Rydberg series 6sns $^3S_1$, 6snd $^3D_1$, $^3D_3$, and 6sng as well as perturbing levels of these series belonging to 5dnd configurations have been observed. By means of multichannel quantum-defect theory (MQDT), the authors have performed the analysis of all available energy data relevant to the J=1, 3, 4, 5 even-parity bound spectra of barium. The behaviour of 6sns $^3S_1$, 6snd $^3D_1$, $^3D_3$ series perturbed by levels pertaining to the 5dns (n=7, 8) and 5dnd (N=6, 7) configurations is clearly interpreted. The MQDT analyses of J=1 and 3 spectra complementary to that previously performed on the J=2 spectrum offer the possibility of studying the anomalous fine structures of highly excited 6snd configurations. The MQDT analyses of J=3-5 spectra explain the observed energies of 6sng $^3G_{3,4,5}$ and $^1G_4$ Rydberg levels; the fine structures of the 6sng series are only partially resolved in the vicinity of 5d7d J=3 to 5 perturbing levels. Since the J=0 and J=2 bound even-parity spectra of Ba have already been analyzed by MQDT, the authors have now a full MQDT description of the bound even-parity spectrum for J values ranging from 0 to 5. 100292 Intramolecular energy redistribution in polyatomic ions. C.Lifshitz (Dept. of Phys. Chem., Hebrew Univ. of Jerusalem, Jerusalem, Israel).
J. Phys. Chem. (USA), vol.87, no.13, p.2304-13 (23 June 1983).
Experimental techniques are able to prepare polyatomic ions with well-defined amounts of internal energy. Recent studies utilizing these techniques indicate that internal conversion from excited electronic states and isomerization can lead to nonrandom dissociation paths by channeling vibrational energy into a limited number of degrees of freedom. Bimodal kinetic energy release distributions are obtained due to incomplete randomization of internal energy. (115 refs.)

31.90 OTHER TOPICS IN THE THEORY OF ATOMS AND MOLECULES

(inc. properties other than energy)

100293 Non-monotonic dependence of electronic relaxation rate on solvent viscosity. B.Bagchi, S.Singer, D.W.Oxtoby (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA).
Chem. Phys. Lett. (Netherlands), vol.99, no.3, p.225-31 (5 Aug. 1983).
Electronic relaxation processes in solution in which intramolecular potential barriers to reactive motion are absent are modelled by Brownian motion of a solute particle on a harmonic surface with a position-dependent sink. The resulting Fokker-Planck equation with the sink term is solved by generating stochastic trajectories. The authors find that the rate constant for population decay is a non-monotonic function of solvent friction. The Smoluchowski equation is found to overestimate the rate significantly in the low-friction regime. (16 refs.)

100294 Multireference many-body perturbation theory: application to O_2 potential energy surfaces. M.G.Sheppard, B.I.Schneider, R.L.Martin (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
J. Chem. Phys. (USA), vol.79, no.3, p.1364-8 (1 Aug. 1983).
A modification of multi-reference many-body perturbation theory is introduced and applied to potential surface calculations of the first $^3\Sigma_g^-$, $^1\Delta_g$, and $^1\Sigma_g^+$ bound states of O_2. The modification enhances the convergence and efficiency of both Rayleigh-Schrodinger and Brillouin-Wigner expansions by prediagonalizing the primary space and then contracting to a smaller dimension space before calculating perturbative corrections. (42 refs.)

100295 Density functional calculations for low-lying states of CO_2. R.O.Jones (Inst. fur Festkorperforschung, KFA Julich, Julich, Germany).
J. Chem. Phys. (USA), vol.79, no.4, p.1885-90 (15 Aug. 1983).
Density functional calculations have been performed for the potential energy surfaces of the $^1A_1$, $^3B_2$, and $^3A_2$ states of CO_2 and for the related singlet-triplet splittings. The geometry ($r_{CO}=2.38\ a_0$, $\alpha_{OCO}=118°$) and excitation energy (6.1 eV) of the lowest-lying $^1B_2$ state agree well with experimental

estimates. The energy surfaces are in accord with the qualitative predictions of Mulliken and Walsh. (30 refs.)

100296 Infrared stimulated Raman scattering in rubidium vapor with a tunable pump frequency. N.V.Znamenskii, V.I.Odintsov.
Opt. & Spectrosc. (USA), vol.54, no.1, p.55-7 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.96-9 (Jan. 1983).
The threshold energy, and spectral characteristics of the IR stimulated Raman scattering from the $5^2P_{3/2}$ level of the rubidium atom have been studied. This level was populated through cascade transitions from higher levels produced by many-photon ionization of the atoms. The results are compared with the characteristics of the IR stimulated Raman scattering excited in the ordinary arrangement, in which the initial level is populated by the beam from an auxiliary laser. It is shown that the stimulated Raman scattering is excited at roughly the same efficiency in the two cases. (11 refs.)

32.20J Visible and ultraviolet spectra

(for fluorescence and phosphorescence spectra, see 32.50)

100297 Absorption spectrum of Sr I betwen 1400 and 1900 Å. C.M.Brown (E.O. Hulbert Center for Space Res., Naval Res. Lab., Washington, DC, USA).
J. Opt. Soc. Am. (USA), vol.73, no.8, p.985-93 (Aug. 1983).
The high-dispersion absorption spectrum of Sr I is reported for the 1400-1900-Å region. Observations include transitions from $5s^2\ ^1S_0$ to the $J=1°$ channels of Sr I associated with the excited $4d\ ^2D$ and $5p\ ^2P°$ ion cores of Sr II. Autoionization and channel mixing of the observed $J=1°$ channels are correlated by using methods based on multichannel quantum-defect theory. (37 refs.)

100298 Analysis of the $4d^9$-$4d^85p$ transitions in eleven-times ionised barium (Ba XII). J.Sugar, J.L.Tech, V.Kaufman (NBS, Washington, DC, USA).
J. Opt. Soc. Am. (USA), vol.73, no.8, p.1077-9 (Aug. 1983).
The spectrum of eleven-times ionised barium was generated in a triggered, high-voltage, vacuum spark and photographed with the National Bureau of Standards 10.7-m grazing-incidence spectrograph. The spectral lines of the transition array $4d^9$-$4d^85p$ were identified in the range of 100-125 Å. Thirty-nine lines of this array have been classified as transitions from 32 levels of the $4d^85p$ configuration to the $4d^9\ ^2D$ ground term. Radial energy integrals were fitted to the observed levels of $4d^85p$, and the relative intensities in the array were calculated with fitted eigenvectors. These intensities were in good qualitative agreement with the relative intensities that had been visually estimated on the photographic plate. Least-squares-fitted values for the energy parameters and their ratios to the calculated Hartree-Fock (HF) values are given. (12 refs.)

100299 Atom in extremely strong magnetic fields. H.Ruder, H.Herold, W.Rosner, G.Wunner (Univ. Tubingen, Tubingen, Germany).
Phys. Bl. (Germany), vol.39, no.7, p.183-9 (July 1983). In German.
In extremely strong magnetic fields of flux densities up to 10^9 T even hydrogen atoms become deformed to a practically linear shape. The Lorentz forces then dominate the Coulomb forces. Magnetic fields of more than 10^4 T blur the hydrogen lines in the visible part of the spectrum. Only in high magnetic fields does the spectrum become clearer again after completion of the restructuring of the energy levels. The finite mass of the proton has a significant effect jon the Lamb shift. (9 refs.) *R.S.*

32.20R X-ray spectra

100300 Ultrasoft X-ray emission from atoms and molecules. J.Nordgren, C.Nordling (Inst. of Phys., Univ. of Uppsala, Uppsala, Sweden).
Comments At. & Mol. Phys. (GB), vol.13, no.5, p.229-49 (1983).
Ultrasoft X-ray (USX) emission has become a useful source of information on atoms and molecules. Experimental techniques for USX spectroscopy and its application to the study of molecular valence electronic structure, vibrational excitations, core electron binding energies, core state lifetimes and multiple excitation processes are reviewed. (69 refs.)

100301 Two-electron, one-photon transitions in nickel. S.I.Salem, A.Kumar, B.L.Scott (Dept. of Phys. Astron., California State Univ., Long Beach, CA, USA).
Phys. Lett. A (Netherlands), vol.97A, no.3, p.100-2 (15 Aug. 1983).
The two emission lines, $K\alpha_1\alpha_3{}^h$ and $K\alpha_2\alpha_3{}^h$ resulting from the two-electron transitions $1s^{-2}\rightarrow 2s^{-1}2p_{3/2}{}^{-1}$ and $1s^{-2}\rightarrow 2s^{-1}2p_{1/2}{}^{-1}$ were resolved for elemental nickel. Their measured energies agree well with calculations. Their relative intensity $I(K\alpha_1\alpha_3{}^h)/I(K\alpha_2\alpha_3{}^h)\approx 3/4$ and their intensity relative to that of the $K\alpha$ diagram lines is about 10^{-4}. This is some 10^4 times larger than both theoretical results and the results of ion-atom collision experiments. (16 refs.)

100302 Precise measurement of the widths of some L X-ray lines of tungsten. B.G.Gokhale, S.N.Shukla, Raman Nath Srivastava (Phys. Dept., Lucknow Univ., Lucknow, India).
Phys. Rev. A (USA), vol.28, no.2, p.858-62 (Aug. 1983).
The widths of the L X-ray lines $L\alpha_1$, $L\alpha_2$, $L\beta_1$, and $L\gamma_1$ of tungsten have been measured to an accuracy of 4-6% with a high-resolution 90-cm-radius bent crystal Cauchois spectrograph, with the use of the photographic-photometric method. The measured values have been compared with those of earlier workers as well as with those obtained from theoretical self-consistent-field calculations. The authors values of the $L\alpha_1$ and $L\alpha_2$ widths are in good agreement with those deduced from the recent Dirac-Hartree-Slater estimates of Chen et al. (1981) for the L and M subshells. Contrary to results of earlier workers, the width in eV of the $L\beta_1$ line is found to be larger than that of the $L\alpha_1$ line, a result which is in conformity with theoretical predictions. On the other hand, the authors measured value of the width of the $L\gamma_1(L_2N_4)$ line does not agree with the results of earlier workers, but is in fair agreement with the nonrelativistic estimate of McGuire (1974). The need for a relativistic calculation of the N subshell widths therefore seems to be indicated. (34 refs.)

32.60 ZEEMAN AND STARK EFFECTS

100303 Semiempiric method of estimating the energy levels splitting parameter due to the tunnel effect. A.A.Abdurakhmanov, R.A.Ragimova.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.5, p.94-8 (1982). In Russian.
Suggests semiempiric methods of estimating the energy levels splitting parameter due to tunnelling light atomic groups via low potential barriers. The possibility of estimating the splitting value with a precision sufficient for practical purposes by the Stark effect of the identified transitions is shown. (10 refs.)

100304 Electronic and magnetic circular dichroism spectra of matrix-isolated nickel atoms. R.Grinter, D.R.Stern (School of Chem. Sci., Univ. of East Anglia, Norwich, England).
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.7, p.1011-20 (July 1983).
The absorption and magnetic circular dichroism spectra of nickel atoms isolated in argon, krypton and xenon matrices have been measured. Comparison of the these spectra with gas-phase data and with the results of calculations shows that the ground state of the nickel atom in these matrices is $3d^94s^1{:}^3D_3$, and not $3d^84s^2{:}^3F_4$ as it is in the gas phase. The spectra in the three matrices are correlated and, as far as possible, assigned. It is shown that some bands previously attributed to atoms are more probably due to small nickel molecules. (21 refs.)

100305 Theoretical calculation of the dependence of Zeeman-sublevel energies on the magnetic field for the $2p^54p$ Ne I, $3p^56p$ Ar I, and $1s3d$ He I configurations. G.P.Anisimova, R.I.Semenov.
Opt. & Spectrosc. (USA), vol.54, no.1, p.23-6 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.41-7 (Jan. 1983).
The dependence of the Zeeman-sublevel energies on the magnetic field is obtained in intermediate coupling in the single-configuration approximation and with the semiempirical method for the $1s3d$ He I (0-10000 Oe), $2p^54p$

Ne I, and $3p^5 6p$ Ar I (0-300000 Oe) configurations as a result of the diagonalization of the total energy matrix. (7 refs.)

100306 Investigation of the Stark effect in krypton autoionizing Rydberg series with the use of two-step laser excitation. C.Delsart, J.-C.Keller (Lab. Aime Cotton, CNRS, Orsay, France).
Phys. Rev. A (USA), vol.28, no.2, p.845-9 (Aug. 1983).
The first detailed observation of the perturbations by an electric field of the Rydberg autoionizing resonances of a rare-gas atom is reported. The Stark spectroscopy of autoionizing Rydberg states converging to the second ionization limit $4p^5\ {}^2P^o{}_{1/2}$ in Kr I is performed in an atomic beam with the use of a two-step laser excitation from the $4p^5 5s[3/2]_2^0$ metastable state. In addition to the verification of the $(n)^{-3}$ dependence of the zero-field width of two autoionizing series and of the linear dependence of the Stark-manifold splittings with the electric field, the authors have observed an $(n)^{0.7}$ law for the dependence of the Stark-manifold splitting along the series, an important narrowing and dissymmetrization of the nd' resonances, and a nonlinear-field behavior of Stark-manifold components in the vicinity of the first anticrossing. Discussions are carried out with the use of the recent work on Rydberg-Stark spectroscopy and on autoionizing states in two-electron atoms. (18 refs.)

100307 Stark quenching of metastable 2S states in hydrogen and helium at high fields. H.K.Holt (Center for Absolute Phys. Quantities, NBS, Washington, DC, USA).
Phys. Rev. A (USA), vol.28, no.2, p.1157-9 (Aug. 1983).
The time-dependent theory of the Stark quenching of $2S$ states in hydrogen and helium is developed for high electric fields, fields for which the Stark matrix element is large compared to the state separations. The metastable $2S$ state of an atom is mixed with two P states by the field, and the subsequent decay is described. (3 refs.)

32.70 SPECTRAL LINE SHAPES AND INTENSITIES

100308 Lifetime measurements of some levels of singly ionised xenon. V.Fonseca, M.Ortiz, J.Campos (Catedra de Fisica Atomica, Facultad de Ciencias Fisicas, Ciudad Univ., Madrid, Spain).
J. Opt. Soc. Am. (USA), vol.73, no.8, p.1070-3 (Aug. 1983).
The lifetimes of 15 levels of Xe II have been measured by a delayed coincidence method through 31 transitions in the range from 2576.97-to 5339.38-Å wavelengths. The measured levels belong to the $5p^4 6p$, $5p^4 6d$, and $5p^4 7s$ configurations. For three levels the authors' values are the first ones reported to the authors' knowledge. Theoretical calculations in *LS* coupling have been performed, and a comparison is made with other experimental and theoretical values. (20 refs.)

100309 Intensity ratios of multipole lines of Bi II. J.Kwela, S.Zachara (Inst. of Phys., Univ. of Gdansk, Gdansk, Poland), M.Hults.
J. Opt. Soc. Am. (USA), vol.73, no.8, p.1074-6 (Aug. 1983).
The intensity ratios of the multipole lines corresponding to transitions between levels of the $6s^2 6p^2$ ground electronic configuration of Bi II have been measured. Two ratios were found to be $I_{368.3}/I_{324.1}=0.17\pm0.03$ and $I_{591.3}/I_{485.0}=0.65\pm0.13$. These values are compared with the theoretical predictions and other experimental results. The ratios found are used to calculate the value of the radial integral $s_2=e\int_0^\infty P_{nl}(r)r^2\ P_{n'l'}(r)dr$, which is found to be $8.5\pm0.8[ea_0^2]$. (14 refs.)

100310 Oscillator strengths in the gallium sequence. K.Aashamar (Inst. of Phys., Univ. of Oslo, Oslo, Norway), T.M.Luke, J.D.Talman.
J. Phys. B (GB), vol.16, no.15, p.2695-708 (14 Aug. 1983).
The multiconfiguration optimised potential model has been applied to the first six elements of the gallium sequence. The structure of the ^2P ground state as well as of the two lowest ^2S and ^2D terms has been calculated along with the *gf* values for the ^2P-^2S and ^2P-^2D transitions. Irregularities in the isoelectronic behaviour of the *gf* values owing to plunging terms of the $4s4p^2$ configuration are accounted for and comparison is made with recent experiments. Some discrepancies between theory and experiments have been cleared up but some still remain. (18 refs.)

100311 1.14-μm thulium line unbroadened by collisions. E.B.Aleksandrov, V.N.Kotylev, K.P.Vasilevskii, V.N.Kulyasov.
Opt. & Spectrosc. (USA), vol.54, no.1, p.1 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.3-4 (Jan. 1983).
Describes an attempt to measure the broadening by inert gases of the 1.14-μm forbidden line of thulium (the $^2F_{5/2}$-$^2F_{7/2}$ transition in the fine structure of the ground state). The 1.14-μm line corresponds to a magnetic-dipole transition within the confines of an inner filled $4f$ shell. (4 refs.)

100312 Oscillator strengths of lines in the 20-80-nm range of the neon absorption spectrum. Yu.M.Aleksandrov, P.F.Gruzdev, M.G.Kozlov, A.V.Loginov, V.N.Makhov, R.V.Fedorchuk, M.N.Yakimenko.
Opt. & Spectrosc. (USA), vol.54, no.1, p.4-7 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.7-13 (Jan. 1983).
The oscillator strengths of lines corresponding to electronic transitions in the p^6 subshell to levels of p^5ns and p^5nd (n=3-6) configurations have been measured by the total-absorption method. The spectra were obtained at the 680-MeV FIAN synchrotron. Concentrations were determined from the absorption of the ionization continuum at the ionization threshold. The radiative lifetimes and the oscillator strengths have been calculated. The computations were based on an intermediate-coupling scheme with the electrostatic, spin-orbit, and effective interactions induced in the energy matrices. Parameters of the autoionization lines corresponding to electronic transitions from the s^2 subshells and the two-electron excitation $2p^6$-$2p^4 3s^3 p$ were measured. The behavior of the oscillator-strength densities near the $^2P_{3/2,1/2}$ and $^2S_{1/2}$ thresholds was plotted. The relationships of the near-threshold photoionization cross sections at the $^2P_{3/2}$ and $^2P_{1/2}$ limits were measured. (10 refs.)

100313 Dielectronic satellites of the $1s^2\ {}^1S_0$-$1s2p\ {}^1P_1$ resonance line. Isoelectronic series of carbon. U.I.Safronova, A.S.Shlyaptseva, V.N.Shlyaptsev.
Opt. & Spectrosc. (USA), vol.54, no.1, p.7-10 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.14-19 (Jan. 1983).
Spectra of the isoelectronic series of carbon are calculated. The following states are treated: $1s2s^2 2p^3$; $1s2s2p^4$; $1s2p^5$; $1s^2 2s^2 2p^2$; $1s^2 2s2p^3$; and $1s^2 2p^4$. The atomic characteristics, the transition wavelengths λ, the radiative transition probabilities $A_{\gamma\gamma'}$, the nonradiative decay probabilities Γ_γ are calculated in the intermediate-coupling scheme using the theory of perturbations in $1/z$ and the Breit Hamiltonian for taking into account relativistic effects. The factor $Q_d=g_\gamma[(A_{\gamma\gamma'}+\Gamma_\gamma)/(\Gamma_\gamma+\Sigma_{\gamma'}A_{\gamma\gamma'})]$, determining the relative line intensity, is calculated. Numerical values of Q_d are given for the ions that have been most intensively studied at present: O III; Ne V; Mg VII; Si IX; S XI; Ca XV; Ti XVII; and Fe XXI. The theoretical spectra given for these ions are a clear graphical interpretation of the calculation. (8 refs.)

100314 Radiative lifetime measurement in the $5^2P_{1/2}$ state of silver by level crossing spectroscopy. M.Soltanolkotabi, R.Gupta (Dept. of Phys., Univ. of Arkansas, Fayetteville, AR, USA).
Phys. Lett. A (Netherlands), vol.96A, no.8, p.399-401 (25 July 1983).
The authors have measured the radiative lifetime of the $5^2P_{1/2}$ state of silver by level-crossing spectroscopy to be $\tau(5^2P_{1/2})=7.56$ (22) ns. (11 refs.)

100315 Power-dependent line shapes of transitions to autoionizing Rydberg states. S.A.Bhatti, W.E.Cooke (Phys. Dept., Univ. of Southern California, Los Angeles, CA, USA).
Phys. Rev. A (USA), vol.28, no.2, p.756-9 (Aug. 1983).
The line shapes of the 6sns, $^1S_0$-$6P_{1/2}$ns transitions in Ba as a function of the laser intensity are modeled with the use of two-channel multichannel quantum-defect theory and the isolated-core-excitation model. An analytical expression for the line shape is derived and used to obtain a value of $|\langle g|r|e\rangle|=4.1$ a.u. for the dipole transition moment of the Ba^+ ionic 6s-$6P_{1/2}$ transition, in agreement with a recent theoretical calculation. (11 refs.)

100316 Liouvillian Green's-function theory of spectral line shape. M.D.Girardeau, C.F.Hart (Dept. of Phys., Univ. of Oregon, Eugene, OR, USA).
Phys. Rev. A (USA), vol.28, no.2, p.1072-97 (Aug. 1983).
The general method of the preceding paper is applied to the theory of spectral line shape. Illustrative calculations of the transition-energy shift and width are carried out for a two-level atom interacting with the quantized electromagnetic field. In the thermal-equilibrium case, explicit results are given in terms of the digamma function and Bose-Einstein distribution, generalizing the standard Lamb-shift and Weisskopf-Wigner natural width results to nonzero temperature. In the nonequilibrium case expressions are obtained which exhibit the influence of nonequilibrium photon distributions on the shift and width. A general theory of the time-dependent power radiated in the decay of an excitation is developed for systems not necessarily at or near equilibrium, in terms of appropriate generalizations of the Liouvillian Green's functions of the preceding paper. This approach is illustrated by calculation of the time-dependent radiated power for the same two-level model. (40 refs.)

100317 Calibration of oscillator-strength measurements for the principal-series transitions of potassium. C.C.Wang (Ford Motor Co., Dearborn, MI, USA), B.Shirinzadeh.
Phys. Rev. A (USA), vol.28, no.2, p.1166-8 (Aug. 1983).
Oscillator-strength measurements have been calibrated against the radiative lifetime for the 4s-4p transition of potassium. This yields a value of $(8.1\pm0.5)\times10^{-21}$ cm^2 for the photoionisation cross section at the series limit, and implies a value for the cross-section minimum in good quantitative agreement with that calculated by Seaton. (10 refs.)

100318 X-ray shifts for additional atomic vacancies. S.K.Roy, D.K.Ghosh, B.Talukdar (Dept. of Phys., Visva-Bharati Univ., West Bengal, India).
Phys. Rev. A (USA), vol.28, no.2, p.1169-72 (Aug. 1983).
The simple analytical model of Burch et al. (1974) for the calculation of K X-ray and Auger energy shifts resulting from an additional vacancy in the $2p$ orbital is extended to arbitrary defect configurations. The energy shifts for K,L, and M X-ray series of ^{86}Rn are calculated for vacancies in $1s$, $2p$, $3d$, and $4f$ orbitals. The relative importance of inner- and outer-shell vacancies in producing the X-ray shifts is discussed. (8 refs.)

32.80 PHOTON INTERACTIONS WITH ATOMS

100319 Monoenergetic atomic beam deflection by resonant light pressure. Wang Yuzhu (Shanghai Inst. of Optics & Fine Mech., Acad. Sinica, Shanghai, China).
Chin. Phys. (USA), vol.3, no.2, p.463-6 (April-June 1983).
The author has calculated the deflections of nearly monoenergetic atomic beams under resonant laser light pressure. These deflection experiments may be used to analyze the velocity distributions in atomic beams, to measure the lifetimes of excited states of atoms, and to verify the theory of photon statistics. (7 refs.)

100320 Quantum-mechanical spectral moments in collision-induced light scattering and collision-induced absorption in rare gases at low densities. M.Moraldi (Istituto di Elettronica Quantistica, CNR, Florence, Italy).
Chem. Phys. (Netherlands), vol.78, no.2, p.243-50 (15 July 1983).
A rigorous quantum-mechanical expression for the second spectral moment in both collision-induced light scattering and in collision-induced absorption is derived. The expression is easily evaluated when a quantum-mechanical radial distribution function is computed. (10 refs.)

100321 Saturation behavior of a far-wing satellite. W.Molander, M.Belsley, K.Burnett, D.Farrelly (Joint Inst. for Lab. Astrophys., Univ. of Colorado, Boulder, CO, USA).
J. Chem. Phys. (USA), vol.79, no.3, p.1297-300 (1 Aug. 1983).
The authors use a saddle point method to derive an asymptotic approximation to the adiabatic perturbation theory transition amplitude. This result is used to discuss the saturation of an 'optical' collision when the field is resonant at an extremum of the potential energy difference. They point out that although the onset of saturation in this satellite occurs for lower field strengths than those needed to saturate a linear crossing, the satellite saturates more slowly than a linear crossing as the field strength is increased. (18 refs.)

100322 Diffraction of an atomic beam by standing-wave radiation. P.E.Moskowitz, P.L.Gould, S.R.Atlas, D.E.Pritchard (MIT, Cambridge, MA, USA).
Phys. Rev. Lett. (USA), vol.51, no.5, p.370-3 (1 Aug. 1983).
Preliminary experimental results are reported for the deflection of Na atoms in an atomic beam by a transverse standing-wave laser field whose frequency is tuned between the two ground-state hyperfine components of the D_2 line. In contrast to the two experiments done previously, a splitting of the beam into two symmetric peaks whose separation increases with the electric-field is seen here. In addition, the data show evidence for atomic diffraction: a tendency for scattered atoms to acquire momentum in multiples of $2\hbar k$. (11 refs.)

100323 On the interaction of a radiation field with a nl^N type configuration. O.L.Malta (Dept. de Quimica, Univ. Federal de Pernambuco, Recife, Brazil).
Rev. Bras. Fis. (Brazil), vol.12, no.3, p.413-30 (Sept. 1982).
A comparison is made between electric dipole matrix elements within a nl^N type configuration, as given by the length and velocity formulae. Within the approximation of considering each excited configuration as a degenerate one, it is shown that up to second order the matrix elements of the momentum operator are vanishing in contrast with the Judd-Ofelt theory. This conclusion shows that it is a serious error to use the Judd-Ofelt wave functions and the velocity formula. However, up to third order, in addition to even and odd rank tensors which enter on the same footing in the matrix elements, the velocity formula predicts the contribution of two- and three-particle operators which depend on the energy difference between configurations in the same way as the one-particle operators. A brief discussion of the results is given. (14 refs.)

Quantum theory of light. Second edition ....See Entry 98678

32.80B Level crossing and optical pumping

100324 Transverse optical pumping with modulated light in cesium vapour. K.Kolwas, K.Rosinski (Inst. of Phys., Polish Acad. of Sci., Warsaw, Poland).
Acta Phys. Pol. A (Poland), vol.A64, no.1, p.139-42 (July 1983).
The problem of the transverse optical pumping of alkalis by amplitude modulated light has been previously investigated theoretically by the dressed atom procedure. Here is reported an experimental verification of some results. For the first time in an experiment of this kind the shape of the Zeeman resonance in the ground state was found. The dependence of the resonance signal on the square of the light intensity was stated to be in good agreement with the theoretical prevision. (6 refs.)

100325 Level-crossing effects in optogalvanic spectroscopy. J.N.Dodd (Dept. of Phys., Univ. of Otago, Dunedin, New Zealand).
J. Phys. B (GB), vol.16, no.15, p.2721-31 (14 Aug. 1983).
Sub-Doppler width signals have been observed in the optogalvanic current when a magnetic field is altered through regions of Zeeman level crossings. It is shown that the signals can be interpreted as due entirely to population changes in the levels involved. (9 refs.)

100326 Collision effects in velocity-selective optical pumping of sodium. C.G.Aminoff, J.Javanainen, M.Kaivola (Dept. of Tech. Phys., Helsinki Univ. of Technol., Espoo, Finland).
Phys. Rev. A (USA), vol.28, no.2, p.722-37 (Aug. 1983).
Reports on a quantitative experimental investigation of velocity-changing collisions by means of velocity-selective optical pumping (VSOP). The authors calculated the VSOP line shape for an atom with hyperfine structure with the use of two phenomenological kernels for the collision effects: the Keilson-Storer kernel, and a two-term kernel consisting of a broad Keilson-Storer part and a narrower Gaussian component. Corrections were included to account for the finite absorption in the sample and the backward reflection of the pumping beam. The experiments were carried out in sodium vapor with neon as the perturber gas. The D_1 line of sodium was used for optical pumping, and the orientation of the ground state was detected. Free parameters of the theory were determined by fitting the predicted line shapes to experimental curves. The Keilson-Storer kernel proved unsatisfactory, but the two-term kernel reproduced well the observed line shapes over the entire collision profiles in the neon pressure range 0-57 mtorr. In an independent experiment using rapidly modulated VSOP the authors also measured directly the cross section of velocity-changing collisions: $\sigma=(1.13\pm0.10)\times10^{-14}$ cm^2. The large weight obtained for the narrow Gaussian from the fits, as well as the collision cross section which is three times as large as the cross section deduced from tabulated gas kinetic radii, may indicate the presence of collisions with relatively small velocity changes in addition to hard-sphere encounters. (30 refs.)

100327 Exactly soluble model of continuum-continuum transitions in strong laser beams. Z.Bialynicka-Birula (Inst. of Phys., Polish Acad. of Sci., Warsaw, Poland).
Phys. Rev. A (USA), vol.28, no.2, p.836-44 (Aug. 1983).
A model of continuum-continuum transitions induced by very intense laser beams is solved. The energy distribution of the photoelectrons is found and it exhibits the broadening and the splitting induced by the laser field. Similar effects are known for bound-bound transitions, but the author's model made it possible to study them systematically in the continuum. (10 refs.)

100328 Optical Hanle effect of Doppler-broadened transitions. V.P.Kaftandjian, Y.Botzanowski, B.Talin (Phys. des Interactions Ioniques et Moleculaires, Univ. de Provence, Marseille, France), L.Klein.
Phys. Rev. A (USA), vol.28, no.2, p.1173-5 (Aug. 1983).
The results obtained in a previous article [ibid., vol.23, p.1365, (1981)] for the optical Hanle effect of an atomic beam (no Doppler broadening) are extended to the case of a dilute gas with Doppler width greater than the collision or natural width. It is shown that the optical Hanle effect is independent of the Doppler width for the case where the strong-field detuning is larger than the Rabi frequency and the weak-field excitation detuning. Analytical results are obtained for a $J=0\rightarrow J=1$ transition. (7 refs.)

100329 Polarization of an atomic sodium beam by laser optical pumping. J.T.Cusma, L.W.Anderson (Dept. of Phys., Univ. of Wisconsin, Madison, WI, USA).
Phys. Rev. A (USA), vol.28, no.2, p.1195-7 (Aug. 1983).
A highly polarized ^{23}Na atomic beam is produced by optical pumping with the use of either a multimode CW dye laser or a single-mode ring dye laser followed by a double-passed acousto-optic modulator. Electron-spin polarizations of 0.72 to 0.90 are obtained. (8 refs.)

32.80F Photoionization and photodetachment

100330 Selective detection of ultra-low concentration of atomic cesium by laser radiation. Zhang Zuren, Li Zhaolin, Feng Baohua, Li Shijie (Inst. of Phys., Acad. Sinica, Peking, China).
Chin. Phys. (USA), vol.3, no.2, p.467-72 (April-June 1983).
The two-photon resonance ionization experiment for the detection of ultra-low concentration of atomic cesium is described. Complete saturation of photoionization was achieved. The number of atoms detected with each laser pulse was measured to be 5.3×10^4. By using a tunable dye laser the authors have achieved the two-photon resonance ionizations the first photon excited cesium atom from ground state $6^2S_{1/2}$ to the excited state $7^2P_{1/2}$, and the second photon ionized the excited cesium atom. In this experiment they have used a homemade ablating-wall flashlamp pumped pulsed dye laser forced oscillator; the output linewidth was 0.5 Å, wavelength 4593 Å, pulse energy 300 mJ, and pulse width 2 μs. The laser beam was focused to the region where atomic beam interacted with it. The energy density in this region was always kept greater than 1 J/cm^2. The ionized ion-electron pair was detected by the electrometer. The experimental value was compared with a theoretical calculation which gave a simple calculation model. The experimental results agreed very well with the theoretical calculations. (4 refs.)

100331 Two-photon ionisation cross section calculations of noble gases: results for Ne and Ar. R.Moccia (Istituto di Chimica Fisica, Univ. of Pisa, Pisa, Italy), N.K.Rahman, A.Rizzo.
J. Phys. B (GB), vol.16, no.15, p.2737-51 (14 Aug. 1983).
Two-photon first ionisation cross sections were computed for Ne and Ar by exploiting the results of a random phase approximation calculation. The final states lying in the continuum were described in a static-exchange-type model. The calculations were performed with the length and velocity form of the perturbation operator for the differential and total cross sections. The results of the calculations are presented for linearly as well as for circularly polarised light. (37 refs.)

100332 Theory of photoionisation at Rydberg states interacting with a broad state. A.M.Lane (Theoretical Phys. Div., AERE, Harwell, England).
Phys. Lett. A (Netherlands), vol.96A, no.8, p.402-4 (25 July 1983).
If a Rydberg series interacts with a broad underlying state, the Fano parameters of the Rydberg states vary in a systematic way. The author gives the general theoretical form of the variation in the case of the asymmetry parameter q, and shows that this may change sign up to four times as a function of energy of the Rydberg state. In the case of one channel, there exists a simple function of q and energy that has the remarkable property of being linear in energy. This provides a test of purity of data, and is applied to data on TlI. (6 refs.)

100333 Resonance-enhanced multiphoton ionization: interference effects due to harmonic generation. D.J.Jackson, J.J.Wynne, P.H.Kes (IBM Thomas, J. Watson Res. Center, Yorktown Heights, NY, USA).
Phys. Rev. A (USA), vol.28, no.2, p.781-94 (Aug. 1983).
A general theoretical model for the treatment of multiphoton ionization is presented. In this treatment, the authors explicitly included coherent effects resulting from harmonic generation. The predictions of this model are in agreement with experimental observations that the authors present in this paper. In addition, the model is contrasted with much earlier theoretical treatments of multiphoton ionization and accounts for the anomalous multiphoton-ionization behavior reported by others in the literature. (22 refs.)

100334 Analysis of Ar3p^6 and Kr4p^6 photoionization from photoelectron-spin-polarization data. F.Schafers, G.Schonhense, U.Heinzmann (Fritz-Haber-Inst. der Max-Planck-Gesellschaft, Berlin, Germany).
Phys. Rev. A (USA), vol.28, no.2, p.802-14 (Aug. 1983).
Experimental data of the cross section and of the asymmetry parameter β in combination with photoelectron-spin-polarization results of Ar3p^6 and Kr4p^6 subshell photoionization were used to determine the bound-free matrix elements and phase-shift differences of the continuum wave functions in a photon-energy region from threshold to 41 eV. The paper includes a discussion of the first autoionization region between the $^2P_{3/2}$ and $^2P_{1/2}$ thresholds in the framework of the angular-momentum-transfer formalism. The experimental results are compared with semiempirical and ab initio calculations with the use of line positions and oscillator strengths in the discrete part extrapolated

to the continuum in application of the multichannel quantum-defect theory. (88 refs.)

100335 Photoemission spectra from autoionizing states under recycling conditions. G.S.Agarwal (School of Phys., Univ. of Hyderabad, Hyderabad, India), S.L.Haan, J.Cooper.
Phys. Rev. A (USA), vol.28, no.2, p.1154-6 (Aug. 1983).
Spectral features of the radiation emitted by autoionizing states in the presence of a strong laser field are calculated under the condition of multiple photon absorption and emissions. The method is based on the exact solution of the master equation for the recycled system. The decay spectra are found to exhibit sharp maxima at the laser frequency and for large values of the Fano q value sidebands which are reminiscent of the triplet which one finds in the context of a two-level atom. 100336 KLL Auger energies for boron atomic ions based on the saddle-point variational method. W.L.Luken, J.M.Leonard (Paul M. Gross Chem. Lab., Duke Univ., Durham, NC, USA).
Phys. Rev. A (USA), vol.28, no.2, p.532-7 (Aug. 1983).
The unrestricted Hartree-Fock (UHF) method is shown to be a special case of the saddle-point variational method for atoms and molecules containing inner-shell vacancies. Numerical results determined by this method are presented for excited electronic states of B^+ and B^{2+} atomic ions. These results are compared to experimental Auger energies and to independently calculated results based on the saddle-point variational method without the UHF approximation. (24 refs.)

33.10 CALCULATION OF MOLECULAR SPECTRA

100338 Complete development of dipole moment of tetrahedral molecules. Application to triply degenerate band and to the ν_2 and ν_4 dyade. M.Loete (Lab. de Spectronomie Moleculaire, Univ. de Dijon, France).
Can. J. Phys. (Canada), vol.61, no.8, p.1242-50 (Aug. 1983).
Using a coupling scheme in the T_d group, the author determines all the vibration-rotation operators of the dipole moment of XY_4 molecules up to any order of approximation. The author gives the matrix elements for these operators and general formulas for the calculation of the infrared transition intensities. This general formalism is available for any transition between vibrational sublevels of any symmetry. It can be used for the analysis of isolated bands and for the simultaneous analysis of interacting bands as well. The author shows that this method can be applied to the calculation of Raman intensities and to XY_6 molecules. In some cases, it is possible to carry out a tensorial extension from the T_d group to the O(3) group. The author constructed the operators of the dipole moment adapted to this process using a coupling scheme in O(3). In particular, the author gives the matrix elements for a triply degenerate band. The author uses the contact transformation technique to explain the parameters introduced in the formal expansion of the dipole moment. The author defines the contact transformation operators in a tensorial form. The author applies this method in the case of the two interacting bands ν_2 and ν_4. (28 refs.)

100339 Rotational and vibrational distributions of $N_2(C^3\Pi_u)$ excited by state-selected $AR(^3P_2)$ and $Ar(^3P_0)$ metastable atoms. T.D.Nguyen, N.Sadeghi (Lab. de Spectrometrie Phys., Univ. Sci. et Medicale de Grenoble, Saint-Martin d'Heres, France).
Chem. Phys. (Netherlands), vol.79, no.1, p.41-55 (15 Aug. 1983).
The vibrational distributions of $N_2(C^3\Pi_u)$ and the rotational distributions of $N_2(C^3\Pi_u, \nu'=0)$ excited by energy transfer from state-selected argon metastable $^3P_2$ or $^3P_0$ atoms to nitrogen molecules were studied in the afterglow of a pulsed electrodeless discharge at 300 and 90K. Selective depopulation of one metastable argon species was achieved by optical pumping using a tunable CW dye later. The density of the metastable argon atoms and the intensity of the rotational lines or vibrational bands of the $N_2(C^3\Pi_u \rightarrow B^3\Pi_g)$ fluorescence were monitored in the afterglow. Results obtained at 90K clearly establish a two-component rotational distribution. Rate coefficients for the excitation of the individual vibrational levels of $N_2(C^3\Pi_u)$ by each argon metastable species were determined. The golden-rule model is unable to explain the vibrational distributions obtained by energy transfer; the vibrational population distribution of $N_2(C^3\Pi_u)$ excited by $Ar(^3P_0)$ clearly shows this point. (39 refs.)

100340 Substituted benzenes. V. Normal coordinate analysis of out-of-plane vibrations of mono iodonitrobenzenes. P.Muralidhar Rao, G.Ramana Rao (Dept. of Phys., Univ. Coll., Kakatiya Univ., Warangal, India).
Indian J. Pure & Appl. Phys., vol.21, no.6, p.332-5 (June 1983).
For pt.IV see ibid., vol.20, no.12, p.949 (1982). Normal coordinate analysis is made for the out-of-plane vibrations of ortho, meta and para iodonitrobenzenes using a 14-parameter modified valence force field. The force constants are refined by the method of least-squares employing the vibrational frequencies of the three molecules. The potential energy distributions are computed and the nature of the absorption bands is discussed. (8 refs.)

100341 Substituted benzenes. VI. Vibrational analysis of out-of-plane vibrations of mono bromonitrobenzenes. P.Muralidhar Rao, G.Ramana Rao (Dept. of Phys. Univ. Coll., Kakatiya Univ., Warangal, India).
Indian J. Pure & Appl. Phys., vol.21, no.6, p.336-8 (June 1983).
For pt.V see ibid., vol.21, no.6, p.332-5 (1983). Normal coordinate analysis of ortho, meta and para bromonitrobenzenes is made using a 14-parameter modified valence force field for the out-of-plane vibrations. The force constants are refined by the method of least-squares employing the vibrational frequencies of the three molecules. The potential energy distributions are computed and the nature of the absorption bands is discussed. (9 refs.)

100342 Molecular structure of N_2O_5 in the gas phase. Large amplitude motion in a system of coupled rotors. B.W.McClelland, L.Hedberg, K.Hedberg, K.Hagen (Dept. of Chem., Oregon State Univ., Corvallis, OR, USA).
J. Am. Chem. Soc. (USA), vol.105, no.12, p.3789-93 (15 June 1983).
The structure of dinitrogen pentoxide has been investigated in the gas phase at a temperature of $-11°C$. The molecules consist of two $-NO_2$ groups joined to a fifth oxygen atom by non-colinear bonds. The $-NO_2$ groups are undergoing large amplitude torsional motion about a point of minimum energy corresponding to C_2 symmetry for the molecule with the dihedral angles τ_1 and τ_2 between these groups and the N-O-N plane each about 30° The torsional motion was modeled by a potential representing a competition between bonding forces tending to stabilize the planar conformation and repulsive forces between oxygen atoms on different $-NO_2$ groups tending to destabilize it. The results suggest the motions of the $-NO_2$ groups are loosely coupled in a way such that one torsion angle tends to increase from the minimum energy points as the other decreases. Conversion of molecules between the equivalent conformations τ_1/τ_2 equal to $30°/30°$ and $-30°/-30°$ occurs most easily by a path that includes a saddle point at $90°/0°$ (or $0°/90°$). (24 refs.)

100343 Variational calculation of the rotational constants for acetylene and its isotopic derivatives. K.K.Lehmann, G.J.Scherer, W.Klemperer (Dept. of Chem., Harvard Univ., Cambridge, MA, USA).
J. Chem. Phys. (USA), vol.79, no.3, p.1369-76 (1 Aug. 1983).
A method is presented for calculation of rotational constants for a linear molecule by treating the vibrations variationally, but treating the vibration-rotation coupling perturbatively. The method is applied to the potential energy function for acetylene given by L. Halonen, M.S. Child, and S. Carter [Mol. Phys., vol.47, p.1097 (1982)]. It is found that even though the vibrational energy levels calculated from this potential are in excellent agreement with experiment, the calculated rotational constants are poorly predicted. The calculated ΔBs are systematically inaccurate by about 5% for C_2H_2 and 8% for C_2D_2. This indicates that the potential energy function is inaccurate even near equilibrium. (31 refs.)

100344 Vibrational levels in the self-consistent-field approximation with local and normal modes. Results for water and carbon dioxide. R.M.Roth, R.B.Gerber, M.A.Ratner (Dept. of Chem., Northwestern Univ., Evanston, IL, USA).
J. Phys. Chem. (USA), vol.87, no.13, p.2376-82 (23 June 1983).
Calculations are presented for vibrational energy levels of nonbending H_2O (at correct and linear geometries) and for linear HDO, DTO, $C^{16}O_2$, $C^{16}O^{18}O$. Results obtained from accurate numerical studies are compared to those generated by using the self-consistent-field (SCF) approximation in both normal and local coordinates. It is found that for all cases except H_2O, SCF corrections systematically and considerably improve the zero-order uncoupled normal-mode eigenvalues and render them superior to the local modes even for part of the vibrational overtone region of HDO and DTO. For H_2O, the local-mode picture remains better than SCF, due partly to the small size of the Wilson coupling in local modes (or equivalently to the near-degeneracy of the normal modes). These results demonstrate the quality of the SCF as the best independent-mode approximation. (16 refs.)

100345 On the use of 'effective normal coordinates' in computing the vibration-rotation energy levels of the CO_2 molecule. M.L.Grenier-Besson, A.Mahmoudi (Lab. de Spectroscopie Moleculaire, Univ. Pierre et Marie Curie, Paris, France).
J. Phys. (France), vol.44, no.8, p.923-33 (Aug. 1983). In French.
Perturbation calculations to obtain the vibration-rotation levels fo the CO_2 molecule do not converge well because of an accidentally large value of the coefficient k_{133} in the cubic potential. The convergence can be improved by introducing 'effective normal coordinates' depending on the quantum number ν_3. Relations between spectroscopic constants and molecular parameters have been derived for the symmetric molecule CO_2 in this new formalism. (14 refs.)

100346 Force field in the hydrazine molecule from ab initio MO calculation. N.Tanaka, Y.Hamada, Y.Sugawara, M.Tsuboi (Faculty of Pharmaceutical Sci., Univ. of Tokyo, Tokyo, Japan), S.Kato, K.Morokuma.
J. Mol. Spectrosc. (USA), vol.99, no.2, p.245-62 (June 1983).
Ab initio MO calculations were applied to hydrazine to obtain a reliable molecular force field and to clear up some complexities in the observed spectrum and contradictions in the assignments reported by previous investigators. Various levels of ab initio MO methods, namely the Hartree-Fock (HF) SCF methods with STO-3G, 4-31G, and 4-31G* (in which polarization functions of the nitrogen atoms were added) basis sets, and the configuration interaction (CI) method with a 6-31G* basis set were compared with one another with respect to the calculated molecular parameters. It has been concluded that the HFSCF-4-31G* is, in general, significant and useful, and the improvement caused by elevating the level of calculation up to CI-6-31G* is not very great. For instance, most of the off-diagonal force constant values calculated with HFSCF-4-31G* are already found to be reliable. On the other hand, however, with the 6-31G* CI method, and with anharmonic corrections, nearly perfect reproduction of the observed fundamental frequen-

cies of N_2H_4 has been achieved. Guided by this calculation, a few pieces of new interpretation of the N_2D_4 spectrum have been presented. (23 refs.)

100347 Ab initio rovibrational spectrum of LiNC and LiCN. G.Brocks, J.Tennyson (Inst. voor Theoretische Chem., Katholieke Univ., Toernooiveld, Nijmegen, Netherlands).
J. Mol. Spectrosc. (USA), vol.99, no.2, p.263-78 (June 1983).
Rovibrational calculations are performed on an ab initio potential energy surface for lithium cyanide. Vibrational states localized about both the isocyanide structure and the metastable cyanide structure are found. Calculated fundamental frequencies are LiNC 126.6 cm^{-1} (bend) and 754.3 cm^{-1} (stretch); LiCN 165.8 cm^{-1} (bend) and 688.8 cm^{-1} (stretch). Many states are found in the region of the barrier to isomerization, some of which are delocalized (polytopic). (35 refs.)

100348 Why are formaldehyde and (possibly) propynal nonplanar in their $S_1(\pi^*,n)$ electronic states?. K.K.Innes (Dept. of Chem., State Univ. of New York, Binghamton, NY, USA).
J. Mol. Spectrosc. (USA), vol.99, no.2, p.294-301 (June 1983).
Abnormally low frequencies observed for the out-of-plane vibration (b_12) of the $\tilde{A}^1A_2$ electronic state of formaldehyde (H_2CO) and for the analogous carbonyl hydrogen vibration (a'') of $\tilde{A}^1A''$ propynal (HCCCHO) are modeled by means of two-state calculations of vibronic coupling with higher singlet states, $^1B_2$ and $^1A'$, respectively. In each case, the active vibration is the out-of-plane hydrogen motion. The same vibronic calculations reproduce also the large positive anharmonicities of the active vibrations in the $\tilde{A}(\pi^*,n)$ states; for H_2CO the calculated vibrational spacing alternates as observed, consistent with the known nonplanar structure, while in propynal the calculated spacing increases regularly, thus predicting an effectively planar structure. The nonplanarity of H_2CO is caused mainly by a vibronic coupling constant nearly twice that of propynal. The H_2CO coupling constant is near the value estimated independently by means of the intensity 'borrowed' by the S_1-S_0 transition from the much stronger S_2-S_0 transition. Brief consideration is given to analogous vibrational levels of the $^1A_2$ state of H_2CS and of the $^3A_2$ state of D_2CO in the vibronic context of this paper. (20 refs.)

100349 Adequate representation of the dipole moment function for diatomic molecules and the matrices of vibration-rotation transition moments. I.I.Tugov (Service de Phys. Atomique, CENS, Gif-sur-Yvette, France), V.P.Chernyavsky.
J. Mol. Spectrosc. (USA), vol.99, no.2, p.302-20 (June 1983).
An exponential representation of perturbations is used as a basis of the perturbed Morse oscillator approach which is applied, in a matrix form, for calculating the radial matrix elements for diatomic molecules. An analytic procedure is developed to deduce an exponential-power series expansion for the dipole moment function $m(r)$ from experimental spectral intensities. It is shown that for real anharmonic molecules, the series expansion in powers of $e^{\alpha r}$ (α being the Morse parameter) is an adequate form for representing transition operators, just as the usual series expansion in powers of internuclear distance r is adequate for the case of a harmonic oscillator, and it is equivalent to a series expansion in vibrational wavefunctions. An exponential-power series expansion is derived as well for a model dipole moment function which has a correct long-range dependence and limit. To exemplify the accuracy and efficiency of the technique proposed, the (40×40) matrices of vibration-rotation transition moments $\langle vJ|M(r)|v'J'\rangle(v, v'=0, 1, ..., 39)$ have been calculated for the ground state of CO. Typical results of these computations are presented (up to $v=35$, $J=100$, and $v'-v=1$-4) to illustrate the dependence of vibration-rotation interaction functions on the vibrational and rotational quantum numbers. (26 refs.)

100350 The application of the nonrigid bender Hamiltonian to a quasilinear molecule. P.Jensen, P.R.Bunker (Herzberg Inst. of Astrophys., Nat. Res. Council of Canada, Ottawa, Ontario, Canada).
J. Mol. Spectrosc. (USA), vol.99, no.2, p.348-56 (June 1983).
The nonrigid bender Hamiltonian can be set up using only Van Vleck perturbation theory, for any triatomic molecule (linear, quasi-linear, or bent). It can be used to calculate the rotation-vibration energies of the molecule to high $J(\simeq 10)$ from the bending potential energy function and the stretch and stretch-bend force constants. (12 refs.)

100351 Vibration-rotational and rotational intensities for CO isotopes. C.Chackerian,Jr. (NASA Ames Res. Center, Moffett Field, CA, USA), R.H.Tipping.
J. Mol. Spectrosc. (USA), vol.99, no.2, p.431-49 (June 1983).
Dipole moment matrix elements have been computed for the five most abundant isotopes of CO. The wave functions utilized were obtained from a direct solution of the Schrodinger equation with an accurate RKR potential. The dipole moment function, in the form of a Pade approximant, was chosen to reproduce the experimental measurements near equilibrium, to have the proper united and separated atom limits, and to have the correct long-range asymptotic functional dependence on internuclear separation. Predictions for the 5-0 and 6-0 rotationless matrix elements and Herman-Wallis coefficients are given, and their dependence on the isotopic reduced mass is discussed. For the pure rotational band, $v=v'=0$, explicit Einstein A values and transition frequencies were calculated for the three most abundant isotopes for J up to 55. Because of the accuracy of the spectral frequencies, and the ubiquity of the CO molecule, it is reasonable to expect that some of these lines, in particular, in the fundamental band of $^{12}C^{16}O$, can serve as laboratory standards for intensity measurements. (29 refs.)

100352 The harmonic force field and absolute infrared intensities of butyne-2. T.Koops, T.Visser, W.M.A.Smit (Analytical Chem. Lab., Univ. of Utrecht, Utrecht, Netherlands).
J. Mol. Struct. (Netherlands), vol.100, p.95-123 (July 1983).
The frequencies, harmonic force field and absolute IR intensities for butyne-2-d_0 and butyne-2-d_6 are reported. The final set of 'harmonized' fundamental frequencies for butyne-2-d_0 and butyne-2-d_6 obeys the Teller-Redlich product rule very well. Starting values for the force constants were obtained from the harmonic force field of propyne, and diagonal force constants were adjusted in order to reproduce the experimental 'harmonized' frequencies for the d_0 and d_6 compounds. The integrated IR intensities were measured according to the Wilson-Wells-Penner-Weber method, using nitrogen as a broadening gas. Thirteen sets of $\delta u/\delta S$ values were obtained from the experimental intensities, using an iterative least-squares-fitting procedure. This number could be reduced to one by use of several selection criteria. The signs of the remaining set appeared to be in complete agreement with the best set for propyne as reported by both Kondo and Koga (1978) and by Bode et al. (1980). The final $\delta\mu/\delta S$ parameters were transformed into atomic polar tensors. Both kinds of intensity parameters are discussed and compared with corresponding parameters for related molecules. (42 refs.)

100353 Vibrational anharmonicity constants for PuF_6. K.C.Kim, W.B.Person, B.J.Krohn (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
J. Mol. Struct. (Netherlands), vol.100, p.125-8 (July 1983).
The fundamental vibrations of PuF_6 cluster are in two distinct group-vibrational modes, near-local modes at 589K ± 50 cm^{-1} for the stretching modes and 195 ± 15 cm^{-1} for the bending modes. This clustering results in a corresponding 'bunching up' of the density of states. One of the consequences of this behaviour is that 'hot band' absorption intensity pools into stronger absorption features appearing shifted at regular intervals from the fundamental. This observed structure in the 16-μm region for PuF_6 has been interpreted to yield values for two empirical anharmonicity constants $X_{3j}(j=1, 2, 3)$ and $X_{3k}(k=4, 5, 6)$. (4 refs.)

100354 Ethene thiol: a vibrational analysis. V.Almond, S.W.Charles, J.N.Macdonald, N.L.Owen (School of Phys. & Molecular Sci., Univ. Coll. of North Wales, Bangor, Wales).
J. Mol. Struct. (Netherlands), vol.100, p.223-39 (July 1983).
Describes a detailed study of the internal rotation and vibrational spectrum of ethene thiol, and complements a recent study of its microwave spectrum and rotational isomerism (see Taminoto, 1978 and 1979). (23 refs.)

100355 Conformational and vibrational analysis with the aid of normal coordinate calculations. G.A.Crowder (Dept. of Chem., West Texas State Univ., Canyon, TX, USA).
J. Mol. Struct. (Netherlands), vol.100, p.415-32 (July 1983).
Many organic compounds exist as equilibrium mixtures of two or more molecular conformations, and vibrational spectroscopy can be used to obtain information about the structure of those conformations. Normal coordinate calculations are often an aid to those conformational studies and to making vibrational assignments for the different conformers. Sometimes those calculations are partially inconclusive, and a few results are briefly discussed in which both conclusive and inconclusive results were obtained from calculations. Calculations are then applied to some 1,2-dichloro-and 1,2-dibromoalkanes. Previous calculations on 1,2-dichloropropane and 1,2-dichlorobutane are revised, and calculations are reported for 1,2-dibromopropane, 1,2-dibromopropane-d_6, and 1,2-dibromobutane. Spectra are given for the last two of these compounds. A modified valence force field was determined for each family of 1,2-dihaloalkane that should be transferable to other members of the family. (44 refs.)

100356 Vibrational spectra and chemical structure of hetero-metal complexes and clusters with thiometalate ligands. A.Muller, W.Jaegermann, W.Hellmann (Fakultat fur Chem., Univ. Bielefeld, Bielefeld, Germany).
J. Mol. Struct. (Netherlands), vol.100, p.559-70 (July 1983). In German.
The thioanions of the early transition metals, e.g. $MoOS_3^{2-}$, WOS_3^{2-}, MoS_4^{2-} and WS_4^{2-}, form hetero-metal complexes, which are interesting because of their electronic properties and their relevance to problems of bioinorganic chemistry. Their vibrational spectra are discussed in relation to the molecular structure of the compounds and especially to the wide variety of the coordination types of the thiometalate ligands. It is demonstrated that vibrational spectroscopy (especially Raman and resonance Raman) is a powerful tool for the determination of the local symmetry of the thioanions in polynuclear coordination compounds. (25 refs.)

100357 Vibrational structure of the $n\pi^*$-type quasiline phosphorescence spectra of solid solutions of organic molecules. E.A.Gastilovich, V.G.Klimenko.
Opt. & Spectrosc. (USA), vol.54, no.1, p.51-4 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.90-5 (Jan. 1983).
The question of the Franck-Condon and Herzberg-Teller mechanisms of electronic-vibrational interactions and the change in the configuration of molecules in the excited electronic state of $^3n\pi^*$ molecules containing one and two C=O groups (anthraquinone, xanthone, anthrone) has been discussed on the basis of the vibrational structure of the electronic-vibrational spectra of solutions in *n*-paraffins at 4.2K and also the symmetry and forms of the vibrations revealed in the phosphorescence spectra. Conclusions have been reached about the local character of the electronic-vibrational excitation of molecules in the lower triplet state $^3n\pi^*(A_2)$, and a numerical estimate of the change in the configuration of the molecules in this electronic state has been obtained. (12 refs.)

100358 Effect of isotope substitution on the shift of the centers of vibrational-rotational bands of polyatomic molecules. A.D.Bykov, Yu.S.Makushkin, O.N.Ulenikov.
Opt. & Spectrosc. (USA), vol.54, no.1, p.57-61 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.100-6 (Jan. 1983).
A method to calculate the shifts of the centers of vibrational-rotational bands of normal polyatomic molecules is presented in this paper; it is based on an application of perturbation theory. Formulas are derived for the shift of the band centers; to illustrate the usability of these formulas calculations are performed for water, ozone, and methane molecules. (15 refs.)

100359 Theoretical spectroscopy of small molecules. J.Romelt (Univ. Bonn, Bonn, Germany).
Phys. Bl. (Germany), vol.39, no.7, p.226-32 (July 1983). In German.
Based on the Schrodinger equation grass root calculations of the spectra of small molecules, such as O_2, were attempted. Computer programmes make the problem of multi-electron systems manageable. Systems with up to 25 correlated electrons (e.g. butadiene benzene, furane, pyrrol) at about 100 orbitals and up to 10^6 configurations can be handled. (16 refs.) *R.S.*

100360 On vibrational energy localization at high levels of excitation. Vibrational excitons. A.A.Ovchinnikov, N.S.Erikhman (L.Ya. Karpov Physicotech. Sci.-Res. Inst., Moscow, USSR).
Sov. Phys.-Usp. (USA), vol.25, no.10, p.738-55 (Oct. 1982). Translation of: *Usp. Fiz. Nauk (USSR)*, vol.138, no.2, p.289-320 (Oct. 1982).
This review discusses the properties of highly excited vibrational states of polyatomic molecules and molecular crystals. One can describe small vibrations of molecules with the concept of normal modes. In molecules having several identical valence bonds (C_6H_6, H_2O, etc.) the normal modes that describe the vibrational excitations of these bonds amount to vibrations whose energy is more or less uniformly distributed over all the bonds, with a degree of delocalization of the energy over the bonds that increases with increasing level of excitation. On the other hand, an extensive set of physical phenomena exists (e.g. dissociation of molecules) in which local excitations, a considerable fraction of which are spatially localized, play an important role. A localized state corresponds to a complicated superposition of normal modes. Hence the concept of normal vibrations is inadequate for describing vibrations (or, better expressed, movements) of a highly excited molecule. One can conveniently describe such movements of the molecule in the representation of local modes (LM). As a rule, one takes an LM to mean simply the coordinate of a valence bond of the molecule, e.g. O-H, C-H, etc. A large number of papers has been published recently on the experimental study of LM and infrared spectra, relaxation experiments, selective photochemistry, etc. This review

casts light on these experimental data on the basis of the theory of LM. (95 refs.)

33.20 MOLECULAR SPECTRA GROUPED BY WAVELENGTH RANGES

(for magneto-optical and electro-optical spectra, see 33.45; for fluorescence and phosphorescence spectra, see 33.50; for photoelectron spectra, see 33.65)

100361 The rate constant for the 'dimol' transition of singlet oxygen $O_2(a^1\Delta_g)$, and the likely symmetry of the emitting species. P.Borrell (Dept. of Chem., Keele Univ., Keele, England), N.H.Rich.
Chem. Phys. Lett. (Netherlands), vol.99, no.2, p.144-7 (29 July 1983).
A comparison has been made of the value of the rate constant for the simultaneous 'dimol' emission of $O_2(^1\Delta_g)$, calculated from the absorption spectrum, with those from emission measurements. It is suggested that the emitting $(O_2)_2$ species has D_{2h} symmetry and that the transition is $^1B_{2u}$-^1A_g. The best value is $k=(3.3\pm0.6)\times10^{-2}$ dm^3 mol^{-1} s^{-1} at 295K. The temperature dependence is also discussed. (12 refs.)

100362 Valence-shell photoabsorption by CO_2 and its connections with electron-CO_2 scattering. P.M.Dittman, D.Dill (Dept. of Chem., Boston Univ., Boston, MA, USA), J.L.Dehmer.
Chem. Phys. (Netherlands), vol.78, no.3, p.405-23 (1 Aug. 1983).
Photoabsorption cross sections and photoelectron asymmetry parameters, calculated with the multiple-scattering model (MSM), are reported for the $4\sigma_g$, $3\sigma_u$, $1\pi_u$ and $1\pi_g$ valence levels of CO_2. The results are discussed in the context of photoabsorption and electron energy-loss measurements and other theoretical calculations. Further comparisons are made with previously reported MSM calculations of elastic electron-CO_2 scattering. The close connection between the sets of shape resonances in the electron-scattering and photoabsorption by CO_2 is emphasized with plots of continuum eigenchannel wavefunctions for shape-resonant and nonresonant eigenchannels of σ_u symmetry. (75 refs.)

100363 The vibrational numbering of bands in the spectra of polyatomic molecules. J.C.D.Brand (Dept. of Chem., Univ. of Western Ontario, London, Ontario, Canada), J.H.Callomon, K.K.Innes, J.Jortner, S.Leach, D.H.Levy, A.J.Merer, I.M.Mills, C.B.Moore, C.S.Parmenter, D.A.Ramsay, K.Narahari Rao, E.W.Schlag, J.K.G.Watson, R.N.Zare.
J. Mol. Spectrosc. (USA), vol.99, no.2, p.482-3 (June 1983).
In vibrational assignments of bands of polyatomic molecules, extensive use has been made of the nomenclature introduced by Brand, Callomon, and Watson (1963), e.g. $2_0^2 4_0^1$, $6_0^1 16_1^1$. The principal numbers refer to the vibrations excited and the superscripts and subscripts refer to the number of quanta involved in the upper and lower states, respectively. No confusion has arisen when these symbols are written but there has been some confusion when these symbols are spoken. This unfortunate situation may have been caused by the need in some journals to stagger the superscripts and subscripts. The authors recommend that, when spoken, the superscript should precede the subscript in conformity with the recognized convention in molecular spectroscopy that the upper state precedes the lower state. The also recommend that, when staggering is necessary in print, the same order be followed, e.g. ${4^1}_0$. Reading from left to right, the assignment is then read as four-one-zero, in conformity with standard spectroscopic usage for molecules. (3 refs.)

100364 Towards numerical vibrational spectroscopy. L.A.Gribov (Vernadsky Inst. for Geochem. & Analytical Chem., Acad. of Sci., Moscow, USSR).
J. Mol. Struct. (Netherlands), vol.100, p.13-39 (July 1983).
From the mathematical standpoint, it is possible to reduce a spectral study to the solution of the so-called inverse spectral problems. In practice, the inverse problem is solved through consistent comparison of the spectrum of the model with the experimental spectrum, the degree of closeness between theoretical and experimental spectra providing a quality criterion for the solution. The model may be characterized by different levels of complexity. This paper discusses the course of recent developments in theoretical spectroscopy, the present state of the art, and forecasts future union of experimental and theoretical methods. (16 refs.)

100365 Collisional selection rules in the rotational spectrum for asymmetric-top molecules. V.K.Konyukhov.
Sov. Phys.-Lebedev Inst. Rep. (USA), no.10, p.17-20 (1982). Translation of: *Sb. Kratk. Soobshch. Fiz. AN SSSR Fiz. Inst. P.N. Lebedeva*, no.10, p.20-3 (1982).
The author classifies the energy levels and wave functions of a rigid asymmetric top by using the irreducible representations of the group D_{2h}. The collisional selection rules are estimated. (4 refs.)

33.20B Radiofrequency and microwave spectra

(for NMR spectra, see 33.25; for EPR spectra, see 33.30)

100366 Microwave spectra of ortho-cloroaniline. A.Nonat, A.Bouchy, G.Roussy (Univ. de Nancy, Vandoeuvre-les-Nancy, France).
C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.15, p.1147-50 (25 April 1983). In French.
Microwave spectra of the normal species of o-chloroaniline in the ground state and in the first excited state of vibration associated with the inversion of the amine group have been identified. The rotational constants obtained for the ground state are (MHz): $A=2340.031\pm0.017$, $B=1546.979\pm0.007$ and $C=1014.233\pm0.005$. The ^{35}Cl nuclear quadrupole coupling constants were fitted as (MHz): $\chi_+=67.68\pm0.04$ and $\chi_-=2.34\pm0.08$. (4 refs.)

100367 Microwave structures of cyanocyclopropane and cyclopropylacetylene. Effects of cyclopropyl π conjugation on structure. M.D.Harmony, R.N.Nandi, J.V.Tietz, Jong-In Choe (Dept. of Chem., Univ. of Kansas, Lawrence, KS, USA), S.J.E.Getty, S.W.Staley.
J. Am. Chem. Soc. (USA), vol.105, no.12, p.3947-51 (15 June 1983).
Microwave spectra of two isotopic forms of cyanocyclopropane and four isotropic forms of cyclopropylacetylene have been observed and analyzed. When these data were combined with previous measurements, complete heavy-atom substitution structures were determined. Among other parameters, the bond distances (Å) are as follows: for cyanocyclopropane, $C_1C_2=1.529\pm0.005$, $C_2C_3=1.500\pm0.003$, $C_1C_4=1.420\pm0.006$, $C_4N=1.161\pm0.004$; for cyclopropylacetylene, $C_1C_2=1.527\pm0.006$, $C_2C_3=1.503\pm0.007$, $C_1C_4=1.422\pm0.006$, $C_4C_5=1.211\pm0.004$, $C_5H=1.055\pm0.003$. The structural results have been compared to those in related molecules and are in accord with a simple theoretical model of π-electron donation from the cyclopropane ring to the π systems of the substituents. These data also point to the conclusion that cyclopropyl is a better donor than vinyl when these groups are conjugated with cyano or ethynyl. (32 refs.)

100368 Measurement of the $J=0\rightarrow1$ rotational transitions of three isotopes of ArD^+. W.C.Bowman, G.M.Plummer, E.Herbst, F.C.De Lucia (Dept. of Phys., Duke Univ., Durham, NC, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.2093-5 (15 Aug. 1983).
The authors report the observation of all three isotopic species of ArD^+ detected in samples containing the argon isotopes in their natural abundances. The absorption frequencies were measured using standard millimeter and submillimeter techniques. (14 refs.)

100369 Microwave substitution structure of the amine group in meta-chloroaniline $C_6H_4ClNH_2$. A.Nonat, A.Bouchy, G.Roussy (Lab. de Spectroscopie, Univ. de Nancy I, Vandoeuvre les Nancy, France).
J. Mol. Spectrosc. (USA), vol.99, no.2, p.407-14 (June 1983).
Microwave spectra of amine-deuterated species of 3-^{35}Cl-aniline, $C_6H_4ClNH_2$, have been observed. The two amino hydrogen atoms are found to be out of the plane of the aromatic ring, and appear to be farther out of the plane

when the amine group is deuterated. It has also been shown that the H_{trans} c coordinate (0.300 Å) is larger than the cis one (0.281 Å). (7 refs.)

100370 Microwave spectrum and selenol internal rotation of 2-propaneselenol. J.Nakagawa, A.Nagayama, M.Hayashi (Dept. of Chem., Hiroshima Univ., Hiroshima, Japan).
J. Mol. Spectrosc. (USA), vol.99, no.2, p.415-30 (June 1983).
Microwave spectra of 2-propaneselenol and its deuterated species were measured and assigned for the gauche and trans isomers. The double minimum splittings of the gauche isomers were directly observed from b-type transitions, which were assigned with the aid of a double resonance technique. Rotational constants and torsional splitting of the gauche isomer of the parent species were determined to be $A=7802.50\pm0.75$, $B=2847.68\pm0.04$, $C=2242.03\pm0.03$, $\Delta A=-2.52\pm0.74$, $\Delta B=0.02\pm0.05$, $\Delta C=-0.34\pm0.03$, and $\Delta\nu=368.91\pm0.94$ MHz, where ΔA, and ΔB, and ΔC are the differences of the rotational constants between the (+) and (−) states. From the torsional splittings and the energy differences of the two isomers of the parent and SeD species, Fourier coefficients of the selenol internal rotation potential function were determined to be $V_2=-88\pm15$, $V_3=1543\pm29$ cal/mole on the assumption of $V_1=0$. Dipole moments and their components were also obtained for the two isomers. (12 refs.)

100371 The millimeter wave spectrum of silyl fluoride. R.J.Butcher (Cavendish Lab., Univ. of Cambridge, Cambridge, England), J.H.Carpenter.
J. Mol. Spectrosc. (USA), vol.99, no.2, p.476-8 (June 1983).
The microwave spectrum of SiH_3F in its ground and several excited vibrational states has been investigated by Georghiou et al. (1976) have reinvestigated the $J=2$-1 transitions and measured some higher frequency millimeter-wave transitions. This work, which is complementary to a study of the infrared laser Stark spectrum had two aims: to obtain accurate experimental values of D_J and D_{JK} for all three isotopes and to identify lines of the ν_2 and ν_5 states, which are strongly coupled by Coriolis resonance. Measurements were made using the Newcastle millimeter-wave spectrometer. Harmonics were generated from a klystron at 29 GHz. (4 refs.)

100372 Microwave spectrum and structure of difluoro(trifluorosilyl)borane, SiF_3BF_2. P.R.R.Langridge-Smith, A.P.Cox (Dept. of Phys. Chem., Univ. of Bristol, Bristol, England).
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.7, p.1089-106 (July 1983).
The microwave spectrum of $^{28}SiF_3{}^{11}BF_2$ has been thoroughly examined in the region 24-40 GHz. Transitions have been assigned with the five lowest-lying torsional states and the earlier analysis of the spectrum refined. An improved value for the barrier to internal rotation about the Si-B bond has been determined as $V_6=2.178\pm0.005$ cal mol^{-1} (9.11 ± 0.02 J mol^{-1}). The spectra of the isotopic species $^{28}SiF_3{}^{10}BF_2$ and $^{29}SiF_3{}^{11}BF_2$ have also been assigned allowing the zero-point average Si-B bond length to be determined as 2.027 ± 0.005 Å, significantly longer than that expected for a single bond. The remaining r_z structural parameters are determined to be: Si-F=1.567 ± 0.005 Å, B-F=1.312 ± 0.005 Å, ∠FBF=$118.5\pm0.5°$, ∠FSiB=$110.9\pm0.2°$. The structure and bonding of SiF_3BF_2 are compared with those of related molecules. (28 refs.)

33.20E Infrared spectra

100373 Intermediate infrared absorption of dianion $(2TCNQ)^{2-}$. K.Kral (Inst. of Phys., Czechoslovak Acad. Sci., Praha, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.7, p.791-801 (1983).
Quadratic electron-phonon coupling is implemented into the theory of the infrared absorption of the dianion $(2TCNQ)^{2-}$ and its importance is discussed. A simple rule for the energies of the vibrational transitions in the infrared spectra and their intensities is derived. (14 refs.)

100374 The use of ^{18}O substitution in the characterization of $MReO_4$ molecules. The IR spectrum of matrix-isolated $CsReO_4$. L.Bencivenni, H.M.Nagarathna, K.A.Gingerich (Dept. of Chem., Texas A&M Univ., College Station, TX, USA).
Chem. Phys. Lett. (Netherlands), vol.99, no.3, p.258-61 (5 Aug. 1983).
The molecular structure of gaseous $CsReO_4$ has been studied by matrix isolation IR spectroscopy. The ^{18}O substitution experiments indicate a bidentate structure of C_{2v} symmetry in which the perrhenate anion is slightly distorted from the tetrahedral geometry. (10 refs.)

100375 Emission spectra of supersonically cooled methyldiacetylene cations. S.Leutwyler, D.Klapstein, J.P.Maier (Phys.-Chem. Inst., Univ. Basel, Basel, Switzerland).
Chem. Phys. (Netherlands), vol.78, no.2, p.151-66 (15 July 1983).
The $\tilde{A}^2E\rightarrow\tilde{X}^2E$ ($\Sigma=+1/2, -1/2$) electronic transitions of rotationally/vibrationally cooled $CH_3-C\equiv C-C\equiv C-H^+$ cation, as well as the d_1-/d_3-/d_4-substituted species, were studied by emission spectroscopy. Ion emission was obtained by electron impact on the neutral species seeded in a helium supersonic free jet. Vibrational frequencies in both electronic states are inferred to within ±1 cm^{-1}. Spin-orbit splittings are observed and interpreted on the basis of nonlinear vibronic couplings. Rotational subbands are observed, yielding rotational and Coriolis parameters as well as rotational temperatures. (22 refs.)

100376 Emission spectra of supersonically cooled dimethyldiacetylene cations. D.Klapstein, R.Kuhn, S.Leutwyler, J.P.Maier (Phys.-Chem. Inst., Univ. Basel, Basel, Switzerland).
Chem. Phys. (Netherlands), vol.78, no.2, p.167-73 (15 July 1983).
The $\tilde{A}^2E_u\rightarrow\tilde{X}^2E_g$ emission spectra of 2,4-hexadiyne (dimethyldiacetylene) cation and its d_3- and d_6-deuterated analogues were excited by electron impact on a seeded helium supersonic free jet. Vibrational analyses are made and vibrational frequencies in both states are inferred to ±1 cm^{-1}. Spin-orbit splittings are observed especially in degenerate overtone bands. The observed rotational contours allow a partial rotational analysis. (15 refs.)

100377 A quantitative analysis of the ν_s (IR) bands of H-bonds. I. Theory. Y.Marechal (Dept. de Recherche Fondamentale, CENG, Grenoble, France).
Chem. Phys. (Netherlands), vol.79, no.1, p.69-83 (15 Aug. 1983).
The author establishes a simple relation between the experimental shape of the ν_s bands (X-H...Y) appearing in the IR spectra of H-bonds and the shape that these ν_s bands would exhibit after a complete elimination of their irrelevant features due to Fermi resonances. The author writes the Hamiltonian governing ν_s vibrations which are strongly modulated by low-frequency vibrations and interact at the same time with other modes whose binary combinations or overtones have energies comparable to ν_s. The analysis of the spectrum corresponding to such a Hamiltonian allows one to establish such a relation at the price of reasonable hypotheses which are discussed in detail. These hypotheses are the consequences of the two following statements: because ν_s bands are broad and smooth the high-resolution effects are ignored, because spectra without Fermi resonances exhibit no particular features it is unlikely that relaxation effects due to Fermi resonances may be significant. Such a relation is easily amenable to computation which will be made, for a definite example, in the following article. (33 refs.)

100378 Spectroscopic evidence for proton transfer within the bimolecular complex HI-NH_3 trapped in cryogenic matrices. L.Schriver, A.Schriver, J.P.Perchard (Lab. de Spectrochimie Moleculaire, Univ. Pierre et Marie Curie, Paris, France).
J. Am. Chem. Soc. (USA), vol.105, no.12, p.3843-8 (15 June 1983).
The infrared spectra for the 1:1 complexes of HI and either NH_3 or $N(CH_3)_3$ (TMA) isolated in four different matrices (Ar, O_2, N_2, C_2H_4) have been obtained at 10K. These complexes are mainly characterized by the stretching vibration (ν_s) of the proton along the I-N axis, the frequency of which strongly varies with the nature of the matrix: for HI-NH_3, 1255 (Ar), 1310 (O_2), 1847-1967 (N_2), and 2315 cm^{-1} (C_2H_4); for HI-TMA, 1889 (Ar), 1880-1920 (O_2), 2100-2132 (N_2), and 2315 cm^{-1} (C_2H_4). A comparison with the known spectra of HX-NH_3 (X=F, Cl, Br) and HX-TMA (X=Cl, Br) (1:1) complexes shows that the hydrogen bond is stronger with HI than with other hydro acids, in which the hydrogen atom of HI has tipped toward nitrogen. Thermodynamic arguments about the enthalpy of reaction of proton transfer within a NH_3/HX pair support this conclusion. The matrix frequency shift shows that the rate of proton transfer is strongly matrix dependent and is believed to be complete in an ethylene matrix, for which the ν_s frequencies are the same for both HI-NH_3 and HI-TMA complexes. Such a sensitivity of the proton potential curve to the surroundings had been predicted in recent theories of solvent effects. (24 refs.)

100379 Carbon dioxide activation by lithium metal. I. Infrared spectra of $Li^+CO_2{}^-$, $Li^+C_2O_4{}^-$ and $Li_2{}^{2+}CO_2{}^{2-}$ in inert-gas matrices. Z.H.Kafafi, R.H.Hauge, W.E.Billups, J.L.Margrave (Dept. of Chem., Rice Univ., Houston, TX, USA).
J. Am. Chem. Soc. (USA), vol.105, no.12, p.3886-93 (15 June 1983).
Lithium atoms react spontaneously with carbon dioxide to form $Li^+CO_2{}^-$ and $Li_2{}^{2+}CO_2{}^{2-}$ in inert gas matrices. Reaction of Li and CO_2 in an argon matrix leads also to the formation of $Li^+C_2O_4{}^-$. Two geometrical isomers of $Li^+CO_2{}^-$ have been isolated in solid argon. One has a ring structure in which the metal interacts symmetrically with the two oxygen atoms, while in the second isomer the lithium atom is bonded to only one of the two oxygens. $Li^+CO_2{}^-(C_s)$ rearranges upon photolysis with a Nernst glower IR source to the symmetric $Li^+CO_2{}^-(C_{2v})$. Similarly $Li^+C_2O_4{}^-$ photolytically converts to an $LiCO_2$:CO_2 adduct. $Li_2{}^{2+}CO_2{}^{2-}$ is produced under high concentration of the alkali metal as a result of the reaction of dilithium or two lithium atoms with carbon dioxide. Lithium oxalate ($Li_2C_2O_4$) is formed in concentrated matrices. All three expected intraionic infrared-active modes of $CO_2{}^-$ as well as a Li^+-$CO_2{}^-$ interionic mode have been identified for both $Li^+CO_2{}^-$ geometrical isomers. Isotopic shifts have been measured for lithium-6-, carbon-13-, and oxygen-18-enriched products. A $CO_2{}^-$ valence bond angle equal to 125.7° has been calculated. Normal coordinate analyses have been carried out on $LiCO_2(C_{2v})$ and $LiCO_2(C_s)$ by using 22 and 30 measured frequencies, respectively, for all the isotopomers of the two geometrical isomers. (35 refs.)

100380 Orientational ordering, site structure, and dynamics for octahedral molecules in low temperature matrices: SF_6 and SeF_6 in rare gas solids. L.H.Jones, B.I.Swanson (Los Alamos Lab., Univ. of California, Los Alamos, NM, USA).
J. Chem. Phys. (USA), vol.79, no.3, p.1516-22 (1 Aug. 1983).
From polarization studies of high resolution IR spectra of SF_6 and SeF_6 trapped in noble gas solids the authors show that much of the structure observed for the stretching mode represents site symmetry split components for low symmetry trapping sites, the triply-degenerate ν_3 mode being split into a doubly-and singly-degenerate mode. Most of the sites showing polarization are orientationally ordered with the singly-degenerate component perpendicular to the substrate. They attribute the driving force for ordering to guest-host interaction potentials which result in registry between the molecules and the (111) growth plane during deposition. The observed orientational ordering combined with high temperature annealing studies has allowed the identification of the symmetry of certain trapping sites and further analysis of vibrational dephasing dynamics. Several sites with the same nominal symmetry and structure can be tracked through the matrices discussed herein. The implications of the ordering of impurity structure in a host lattice formed by vapor deposition are discussed. (23 refs.)

100381 Infrared intensities of H_3O^+, H_2DO^+, HD_2O^+, and D_3O^+. M.E.Colvin, G.P.Raine, H.F.Schaefer,III. (Dept. of Chem., Univ. of California, Berkeley, CA, USA), M.Dupuis.
J. Chem. Phys. (USA), vol.79, no.3, p.1551-2 (1 Aug. 1983).
Saykally and co-workers have recently (1983) observed the infrared spectra of HCO^+ and $HN_2{}^+$ and their spectroscopic technique shows promise for the detection of a large number of other polyatomic molecular ions. An immediate target is H_3O^+, for which the subtleties of the rotation-inversion problem may make assignments difficult. In this respect, the availability of theoretical predictions for the infrared intensities may be of some help in unraveling the observed vibrational spectra. Moreover, since the deuterated molecules H_2DO^+ and HD_2O^+ remove the problems associated with C_{3v} symmetry, the identification of these species may in fact be simpler. The authors report infrared intensities for all four isotopic molecules H_3O^+, H_2DO^+, HD_2O^+, and D_2O^+. (12 refs.)

100382 IR spectroscopic study and characterisation of chlorine oxides, $(ClO)_2$, ClO_2, Cl_2O_4 and Cl_2O_3 produced in the chlorine-ozone reactions. R.C.Loupec, J.Potier (Univ. des Sci. & Tech. du Languedoc, Montepellier, France).
J. Chim. Phys. & Phys.-Chim. Biol. (France), vol.80, no.5, p.449-54 (May 1983).
The nonphotochemical reaction of (O_2+O_3) with Cl_2 at −78, −44, −40°C essentially gives chlorine chlorate which is characterized by ν(ClOCl) at 785 and 745 cm^{-1}. Water traces lead to ClO_2 but also to $HClO_3$, HCl and to small quantities of other chlorine oxides by a water catalysed process. In the darkness and in the gas phase, ($p=3$ atm and $t=15$°C), pure ozone reacts with chlorine and gives a ClO_2 rich mixture containing also a high proportion of chlorine chlorate with chlorine perchlorate traces; chlorine chlorate is characterized by $\nu_S(ClO_2)=1015$ cm^{-1} $\nu_{as}(ClO_2)=1280$ cm^{-1} and the two bridge vibrations νClOCl at 735 and 695 cm^{-1}. Reaction mechanisms are proposed. (31 refs.)

100383 Sequential two-photon spectroscopy of some ion-pair states of IBr. J.C.D.Brand, U.D.Deshpande, A.R.Hoy, S.M.Jaywant, E.J.Woods (Dept. of Chem., Univ. of Western Ontario, London, Ontario, Canada).
J. Mol. Spectrosc. (USA), vol.99, no.2, p.339-47 (June 1983).
Molecular constants of the first $E0^+$ ion-pair state of IBr vapor have been determined using polarization-labeling spectroscopy applied to the sequential transitions $E0^+ \leftarrow B'0^+ \leftarrow X0^+$, while the second $f0^+$ ion-pair state is reported and characterized for the first time. Preliminary data for the first $\Omega=1$ ion-pair state, accessed in the sequence $1(^3P_2) \leftarrow A(\Omega=1) \leftarrow X0^+$, indicate that T_e is $\lesssim 30$ cm^{-1} higher in energy than that of the E state. (18 refs.)

100384 Absolute frequency measurements of the 2-0 band of CO at 2.3 μm; calibration standard frequencies from high resolution color center laser spectroscopy. C.R.Pollock, F.R.Petersen, D.A.Jennings, J.S.Wells (Time Frequency Div., NBS, Boulder, CO, USA), A.G.Maki.
J. Mol. Spectrosc. (USA), vol.99, no.2, p.357-68 (June 1983).
The absolute frequencies of 20 lines of the 2-0 band of CO near 4260 cm^{-1} have been measured by heterodyne frequency measurement techniques. Eleven of the lines were measured by saturated absorption techniques which produced linewidths of about 3 MHz. New rovibrational constants have been fitted to these measurements. A table of calculated transition frequencies is given with estimated absolute uncertainties as small as 0.0000023 cm^{-1} (70 kHz) near the band center. The pressure shifts of three lines have been measured and fall in the range from -0.9 to -3 kHz/Pa (-122 to -400 kHz/Torr). It is suggested that the generally accepted frequencies of the 1-0 band of CO should be lowered by 7 MHz. (28 refs.)

100385 Laser Stark spectroscopy of silyl fluoride in the 10-μm region: analysis of the ν_2 and ν_5 bands. R.Escribano (Inst. de Estructura de la Materia, Madrid, Spain), R.J.Butcher.
J. Mol. Spectrosc. (USA), vol.99, no.2, p.450-75 (June 1983).
The $\nu_2=1$ and $\nu_5=1$ states of silyl fluoride are strongly mixed by Coriolis coupling. About 1100 Stark tuned resonances were measured in these bands using $^{12}CO_2$ and $^{13}CO_2$ lasers. These data were combined with 13 new millimeter wave measurements and 900 Fourier transform infrared measurements in a suitable model. Apart from the main Coriolis coupling ζ_{25}, it was necessary to include estimates of two further Coriolis terms to obtain a satisfactory interpretation of the data. Many vibration-rotation parameters and the dipole moments are determined. (18 refs.)

100386 Diode laser spectrum of OCS in a DC discharge. W.Klebsch, K.Yamada, G.Winnewisser (Phys. Inst., Univ. zu Koln, Koln, Germany).
J. Mol. Spectrosc. (USA), vol.99, no.2, p.479-81 (June 1983).
During the last few years unstable molecular species such as radicals, ions, and highly excited states were detected by both microwave and high-resolution infrared spectroscopy in plasmas excited by DC and RF discharges. The authors present new OCS spectra, observed in highly excited vibrational states, mostly assigned to the 20°0-10°0 'hot' band, centered around 2040 cm^{-1}. (6 refs.)

100387 The infrared vibration-rotation spectrum of trans and cis nitrous acid. C.M.Deeley, I.M.Mills (Dept. of Chem., Univ. of Reading, Reading, England).
J. Mol. Struct. (Netherlands), vol.100, p.199-213 (July 1983).
Infrared spectra of the trans and the cis isomers of nitrous acid, both HONO and DONO, have been observed in the gas phase using a Fourier transform interferometer with a resolution of about 0.05 cm^{-1} from 400 to 500 cm^{-1}. Rotational analyses are reported on eleven of the fundamentals and some overtones. (20 refs.)

100388 Diode laser spectra of cis-HONO near 850 cm^{-1} and trans-HONO near 1700 cm^{-1}. A.G.Maki, R.L.Sams (NBS, Washington, DC, USA).
J. Mol. Struct. (Netherlands), vol.100, p.215-21 (July 1983).
Tunable diode laser spectra have been measured for the ν_4 band of cis-HONO near 850 cm^{-1} and the ν_2 band of trans-HONO near 1700 cm^{-1}. The ν_4 band is completely unperturbed and 355 well-resolved transitions have been fit with a standard deviation of 0.0027 cm^{-1}. Rotational and centrifugal distortion constants are given for both bands. (19 refs.)

100389 Infrared and Raman spectra and normal coordinate calculations for methylisothiocyanate. J.R.Durig, J.F.Sullivan, H.L.Heusel (Dept. of Chem., Univ. of South Carolina, Columbia, SC, USA), S.Cradock.
J. Mol. Struct. (Netherlands), vol.100, p.241-57 110 19 (July 1983).
The infrared spectra (3200-50 cm^{-1}) of gaseous and solid CH_3NCS and CD_3NCS and the Raman spectra (3200-10 cm^{-1}) of the liquids and solids have been recorded. The spectra have been interpreted on the basis of a 'pseudo-symmetric top' with C_{3V} symmetry. An assignment of the fundamental vibrations in both molecules, based on their infrared band contours, depolarization values and group frequencies, is given and discussed. Particularly interesting is the low-frequency region where band maxima were observed at 152 and 80 cm^{-1} for CH_3NCS and 139 and 71 cm^{-1} for CD_3NCS in the infrared spectra of the gases. A normal coordinate analysis has also been carried out based on C_{3V} symmetry. Considerable mixing was found between the C_α-N stretch and NCS symmetric stretch in both isotopic species. The other normal modes in CH_3NCS are reasonably pure but, for the CD_3NCS molecule, considerable mixing was found between the CD_3 stretches and NCS antisymmetric stretch. The proposed vibrational assignment and the results of the normal coordinate calculations are discussed and compared with the results obtained for similar molecules. (9 refs.)

100390 Molecular complexes of the hydrogen halides studied by matrix isolation infrared spectroscopy. A.J.Barnes (Dept. of Chem. & Appl. Chem., Univ. of Salford, Salford, England).
J. Mol. Struct. (Netherlands), vol.100, p.259-80 (July 1983).
Spectroscopic studies of base-hydrogen halide complexes are reviewed, including previously unpublished data for complexes of hydrogen chloride and hydrogen bromide with a variety of bases in argon matrices. The variation of the HX stretching relative frequency shift with the hydrogen halide and with the medium (gas phase, argon matrix or nitrogen matrix) and correlations of the HX stretching and hydrogen bond bending frequencies with the proton affinity of the base and with the hydrogen bond stretching force constant or dissociation energy of the complex are discussed. (166 refs.)

100391 FTIR spectra of base-hydrogen fluoride hydrogen-bonded complexes in solid argon. L.Andrews (Dept. of Chem., Univ. of Southampton, Southampton, England).
J. Mol. Struct. (Netherlands), vol.100, p.281-303 (July 1983).
Hydrogen fluoride and base molecules ranging from CO_2 to NH_3 have been codeposited at 12K with excess argon. Fourier-transform infrared spectra of the samples before and after sample warming to allow reagent diffusion and association provide identification of 1:1 and 1:2 hydrogen-bonded complexes. Strong ν_s and ν_1 absorptions of the HF submolecule in the complexes vary with the proton affinity of the base and characterize the strength of the hydrogen-bonded interaction. Base submolecule modes show small displacements from the base molecule spectrum depending upon the structure of the complex. (37 refs.)

100392 Matrix isolation infrared spectra of the complexes between methylacetate and water or hydrochloric acid. G.Maes, Th.Zeegers-Huyskens (Dept. of Chem., Univ. of Leuven, Heverlee, Belgium).
J. Mol. Struct. (Netherlands), vol.100, p.305-15 (July 1983).
The hydrogen-bonded complexes between methylacetate (MeAc) and water or hydrochloric acid have been studied by infrared spectrometry in a low temperature Argon matrix. The $\nu_{C=O}$, $\nu_{C\text{-}O}$ and $\nu_{C\text{-}C}$ vibrational modes of MeAc show a splitting to the low and to the high frequency side of the free molecule. This suggests that water and HCl interact with the keto and either oxygens. This conclusion is supported by the appearance of two main absorptions in the ν_{HCl} region. These results are discussed as a function of the gas-phase basicity of the two oxygen atoms, derived from the O(1s) core electron binding energies and from the ionization potentials. (23 refs.)

100393 Matrix-isolation infrared and ultraviolet spectroscopic studies of less stable conformers of 1,3,5-hexatriene. Y.Furukawa, H.Takeuchi, I.Harada, M.Tasumi (Dept. of Chem., Univ. of Tokyo, Tokyo, Japan).
J. Mol. Struct. (Netherlands), vol.100, p.341-50 (July 1983).
The infrared spectra of the 3-trans and 3-cis isomers of 1,3,5-hexatriene in low-temperature Ar matrices deposited from a high-temperature nozzle or deposited under irradiation of the Hg 253.7 nm light show a number of new bands. Correspondingly, the ultraviolet spectra of the 3-trans isomer observed under similar experimental conditions show a new absorption at 276 nm. Most of these new infrared bands and the new ultraviolet absorption are attributable to less stable isomers which have the planar s-cis conformation [or gauche conformation(s) close to the planar s-cis] about either one or both of the two C-C bonds. (24 refs.)

100394 Vibrational spectra and vibrational states of simple gas-phase hydrogen-bonded dimers. D.J.Millen (Dept. of Chem., Univ. Coll. London, London, England).
J. Mol. Struct. (Netherlands), vol.100, p.351-77 (July 1983).
Outlines the growth of evidence and ideas about infrared band broadening for simple, gaseous, moderately strong, hydrogen bonded dimers B...H-A, to draw attention to areas in need of further development and to collect together experimental information available at the present time about vibrational states associated with such dimers. The band associated with the modified H-A stretching mode, ν_s, is observed for several dimers not only to be broad, but to have sub-band structure, which is satisfactorily interpreted as arising from combination bands of ν_s with the low frequency stretch-mode ν_σ, giving a progression $\nu_s \pm n\nu_\sigma$ as a result of strong anharmonic coupling. For weaker dimers with lower values of ν_σ the sub-band structure is less evident, and may appear only as shoulders, while for still weaker dimers the sub-bands may be merged into a featureless broad band. A major factor contributing to the breadth of the individual sub-bands in the band structure is the presence of hot-bands, especially a long series based on successive excited states of the low-frequency bending mode ν_β. A link is indicated with the interpretation of band-broadening for moderately strong hydrogen-bonded complexes in the liquid state. The anharmonic coupling of ν_s and ν_σ is again a central feature but there is a new factor, namely the coupling of ν_σ through a fluctuating potential with the surroundings, which has the result that the ν_s mode rapidly loses phase coherence resulting in a broad structureless band. (61 refs.)

100395 The conformation and vibrational spectra of isocyanato and isothiocyanatocyclohexane. C.E.Sjogren, P.Klaeboe (Dept. of Chem., Univ. of Oslo, Oslo, Norway).
J. Mol. Struct. (Netherlands), vol.100, p.433-52 (July 1983).
The IR spectra of isocyanato and isothiocyanatocyclohexane ($C_6H_{11}NCX$) as liquids and as amorphous and crystalline solids at low temperatures have been recorded in the region 4000-50 cm^{-1}. High pressure (0-30 kbar) IR spectra of the neat samples were obtained in a diamond anvil cell and various high-pressure solid phases were studied. Raman spectra of the compounds as liquids and as low-temperature solids were obtained. Isocyanatocyclohexane crystallized directly as anisotropic solids containing equatorial molecules at low temperature and axial molecules at high pressure. isothiocyanatocyclohexane formed a possibly plastic phase between 225 and 260K where both equatorial and axial conformers are present. A solid high-pressure phase (1-3 kbar) at ambient temperature appeared anisotropic and contained both the *e* and *a* conformers. Below 225K (atmospheric pressure) and above 10 kbar (ambient temperature) anisotropic crystals were formed which both contained equatorial conformers only. Normal coordinate analyses were carried out for the equatorial and axial conformers of the two molecules with different orientations (C_s and C_1 symmetries) of the side chain. Force constants were transferred from various halo and pseudohalocyclohexanes. Tentative assignments of the fundamentals belonging to both the *e* and *a*-conformers are presented. (28 refs.)

100396 Infrared study of molecular rotation in liquids. J.Vincent-Geisse (Lab. de Recherches Phys., Univ. Pierre et Marie Curie, Paris, France).
J. Mol. Struct. (Netherlands), vol.100, p.539-57 (July 1983).
The study of molecular rotation in liquids by infrared spectroscopy performed in the author's laboratory is reviewed. A number of examples are presented, showing the variety of phenomena encountered in the study of rotational motion of molecules in the liquid state. Many of these phenomena are well understood in simple cases and the nature of the rotation involved may be correctly identified. Problems which remain to be clarified are discussed. (60 refs.)

100397 Spectroscopy of two-photon transitions in C_2H_4 using the degenerate four-photon interaction method. V.N.Varakin, V.M.Gordienko (M.V. Lomonosov State Univ., Moscow, USSR).
JETP Lett. (USA), vol.37, no.4, p.224-6 (20 Feb. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.4, p.188-90 (20 Feb. 1983).
Two-photon resonances with the overtone modes νex_7 and ν_8 of C_2H_4 are investigated by the degenerate four-photon interaction (DFI) method in an amplitude-polarization variant. The spectrum of multiphoton absorption (MPA) onthe lines of the *P* branch of the (00°1-10°0) band of the CO_2 laser is interpreted. (4 refs.)

100398 Infrared spectroscopic studies of hydrogen bonding in triethylammonium salts. II. Association of triethylammonium salts with bases. A.A.Mashkovsky, A.A.Nabiullin, S.E.Odinokov (Pacific Inst. of Bio-organic Chem., Far East Sci. Centre, Acad. of Sci., Vladivostok, USSR).
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.7, p.951-60 (July 1983).
For pt.I see ibid., vol.75, p.629 (1979). Parameters of the i.r. $\nu(N^+H)$ stretching mode bands of triethylammonium perchlorate, fluoroborate and iodide dissolved in pure (base B) and binary (B+chloroform) solvents have been measured. A dynamic equilibrium $Et_3N^+H...A^- + B \rightleftharpoons [Et_3N^+H...B]A^-$ is shown to exist in the solutions. Association constants K_a and enthalpies $-\Delta H$ of this process have been determined by measuring the total areas of the i.r. absorption $\nu(N^+H)$ bands in both hydrogen-bonded complexes. The dependence of K_a values on the strength of the base B and its dipole moment is discussed. Electrostatic interactions are shown not to contribute to the enthalpy of transition from the ionic pair $Et_3N^+H...A^-$ to the ion-molecular

complex $Et_3N^+H...B$, the latter forming a contact pair with the anion A^-. The results do not reveal any differences in the spectral manifestations of hydrogen bonding in intermolecular, ion-molecular complexes and ionic pairs. (12 refs.)

100399 Spectrophotometric investigation of fluorinated neodymium β-diketonates. V.S.Khomenko, T.A.Rasshinina, M.O.Lozinskii, Yu.A.Fialkov.
J. Appl. Spectrosc. (USA), vol.37, no.4, p.1169-73 (Oct. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.4, p.618-23 (Oct. 1982).
In the case of complex formation in the series of rare earth elements (REE), especially Nd^{3+}, Ho^{3+}, and Er^{3+}, under the influence of ligands, changes in the intensity, position and splitting of the absorption bands are observed in the spectra. An investigation of this phenomenon permits a study of the mutual influence of ligands in heteroligand complexes and an elucidation of the change in the nature of the bond of the ligand in o-diketonate complexes of the REE. The work is devoted to an investigation of the nephelauxetic effect, which is expressed in a shift of the bands in the absorption spectra of complexes of the REE on account of a decrease in the interelectronic repulsion in the 4f-electron shell as a result of its expansion during the formation of partially covalent metal-ligand bonds. The parameter of covalency of the bond was estimated chiefly according to the transition $^4I_{9/2}$-$^2P_{1/2}$ of the Nd^{3+} ion, which is not split in fields of any symmetry. It was of interest to bring in the data of mass spectrometric investigation to determine the mutual influence of ligands on the properties of the complexes. A measurement of the diffuse reflection spectra of polycrystalline neodymium compounds was performed. The mass spectra were recorded on a mass spectrography at an energy of ionizing electrons 70 eV. The spectra of the ions were recorded from 200 up to 1000 m/e. (11 refs.)

100400 Enthalpies of the association of pentachlorophenol and several carboxylic acids with bases. A.A.Mashkovskii, A.A.Nabiullin, S.E.Odinokov.
J. Appl. Spectrosc. (USA), vol.37, no.4, p.1174-8 (Oct. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.4, p.623-8 (Oct. 1982).
The enthalpies of the H-complexes of polychlorosubstances (PCIS) and of several strong H-complexes of carboxylic acids have been measured by making use of the total integral intensities of the ν(OH) bands for the measurement of the temperature dependence of the association constants (K_a). The values of $-\Delta H_T$ measured encompass a range from 2 to 14 kcal/mole and show that the spectral method is applicable to the determination of the energy of the H-bond ($-\Delta H_s$) in up to the strongest (up to the limits of protonation of the base) H-complexes. (13 refs.)

100401 *l*-resonance effects in the hot bands $3\nu_5 \leftarrow 2\nu_5$, $(\nu_4+2\nu_5) \leftarrow (\nu_4+\nu_5)$ and $(2\nu_4+\nu_5) \leftarrow 2\nu_4$ of acetylene. J.Hietanen (Dept. of Phys., Univ. of Oulu, Oulu, Finland).
Mol. Phys. (GB), vol.49, no.5, p.1029-38 (10 Aug. 1983).
In the infrared spectrum of C_2H_2 around the fundamental ν_5, the hot bands starting from the levels $2\nu_5$, $2\nu_4$ and $\nu_4+\nu_5$ have been investigated. From the analysis of about 20 different bands, 40 molecular constants describing the bending modes ν_4 and ν_5 have been derived. (6 refs.)

100402 Detection of the hydronium ion (H_3O^+) by high-resolution infrared spectroscopy. M.H.Begemann, C.S.Gudeman, J.Pfaff, R.J.Saykally (Dept. of Chem., Univ. of California, Berkeley, CA, USA).
Phys. Rev. Lett. (USA), vol.51, no.7, p.554-7 (15 Aug. 1983).
The first high-resolution measurement of the ν_3 vibration (doubly degenerate asymmetric stretch) of the hydronium ion (H_3O^+) is reported. An analysis of sixty transitions in the symmetric and antisymmetric inversion states yields effective band origins of 3530.165(55) and 3513.840(47) cm^{-1}, respectively. (9 refs.)

100403 Raman spectroscopic studies on the dynamics of a molecular 'probe' (methyl iodide) in hydrocarbon solvents. W.F.Pacynko, J.Yarwood (Dept. of Chem., Univ. of Durham, Durham, England), D.J.Gardiner.
Chem. Phys. (Netherlands), vol.78, no.3, p.319-22 (1 Aug. 1983).
The authors report the rates of rotational and vibrational relaxation as a function of chain length in a series of model lubricants (*n*-alkanes from C_6 to C_{16}) and in an industrially important traction fluid (Santotrac-40). The 'probe' molecule (CH_3I) dynamics reflect the changes of microstructure of these fluids as the chain length increases. The methyl iodide molecules can rotate rather freely between the hydrocarbon chains (for relatively short chains) but tend to form more continuous regions of 'pure' liquid for the longest chains. The dynamic properties do not follow the macroscopic viscosity of the solvent but can be correlated instead with the effective 'free' volume available in the fluid. It is suggested that such measurements could lead to valuable information about the desired properties of these industrially important fluids. (6 refs.)

100404 On the second rotational isomeric form of butadiene-1,3. Yu.N.Panchenko, A.V.Abramenkov, V.I.Mochalov, A.A.Zenkin (Dept. of Chem., M.V. Lomonosov Moscow State Univ., Moscow, USSR), G.Keresztury, G.Jalsovszky.
J. Mol. Spectrosc. (USA), vol.99, no.2, p.288-93 (June 1983).
Eleven lines of the 'hot' band progression of the torsional overtone $2\nu_{13}$ have been measured in the Raman spectra of cis, cis-1,4-d_2-butadiene-1,3 and d_6-butadiene-1,3. The potential of Carreira (J. Chem. Phys. 62, 3851-3854 (1975)) ($V_1=600$, $V_2=2068$, $V_3=273$, and $V_4=-49$ cm^{-1}) and that of Bock et al. (J. Chem. Soc. Perkin II, 26-34 (1979)) ($V_1=347.3$, $V_2=1790.0$, $V_3=612.8$, and $V_4=179.8$ cm^{-1}) have been used to interpret the results obtained. For the accepted expansion of the Pitzer function $F(\phi)$, it is shown that the potential of Bock et al. reproduces the frequencies of the torsional overtones of these two molecules and h_6-butadiene-1,3 more closely. The importance of data on isotopic molecules in the calculation of potential curves from spectroscopic information is emphasized. (19 refs.)

100405 Vibrational study of strong C-H...X hydrogen bonds in solid complexes of boron decachlorocarboranes. L.A.Leites, L.E.Vinogradova (Inst. of Organo-Element Compounds, Acad. of Sci., Moscow, USSR), J.Belloc, A.Novak.
J. Mol. Struct. (Netherlands), vol.100, p.379-92 (July 1983).
Solid complexes of boron decachloro-*o*-carborane and boron decachloro-*m*-carborane ($B_{10}Cl_{10}C_2H_2$) with some oxygen and nitrogen bases have been investigated by infrared and Raman spectroscopy. Complexes containing C-H . . O hydrogen bonds are characterized by a relative CH stretching frequency shift up to 12% and a halfwidth of the νCH band up to 220 cm^{-1}. C-H . . N hydrogen bonds, with trimethylamine for example, are stronger with a relative shift of about 18% and $\nu_{1/2}$ of about 500 cm^{-1}. Triethylamine complexes, however, form a NH^+ . . C^- proton transfer hydrogen bond while pyridine can give either C-H . . N or C^- . . ^+HN hydrogen-bonded adducts depending on the solvent and temperature. the CH . . $N \leftrightarrows C^-$ . . ^+HN equilibrium appears to be shifted towards ion-pair formation at considerably smaller enthalpy values compared to the O-H . . $N \leftrightarrows O^-$ . . ^+HN system. CH and NH stretching frequencies are correlated with the acidity of the donor and the basicity of acceptor molecules. (23 refs.)

100406 Collision induced light scattering in gaseous H_2S. G.Briganti, V.Mazzacurati, G.Ruocco, G.Signorelli (Dipartimento di Fisica, Univ. La Sapienza, Roma, Italy), M.Nardone.
Mol. Phys. (GB), vol.49, no.5, p.1179-86 (10 Aug. 1983).
Rotational and interaction induced contributions in the light scattering spectrum of gaseous H_2S are identified and discussed as a function of density. The intensity of the latter is shown to obey a density squared dependence and to be in agreement with that predicted by the first order dipoled induced dipole (DID) model for point polarizable scatterers. (25 refs.)

100407 The nature of scattering centers in resonance stimulated Raman scattering by dyes and shape of the emitted spectra. V.I.Petrov, Ya.S.Bobovich.
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.139-43 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.264-72 (Feb. 1983).
An investigation was made of the resonance stimulated Raman scattering (RSTRS) spectra of the polymethine dye 3, 3′-diethylthiatricarbocyanine iodide when the pump frequency was scanned along the long-wavelength edge of the absorption band. A change in the relative intensities of the 505 and 510 cm^{-1} RSTRS lines was observed near the purely electronic transition. The character of this change suggests that this line may be assigned to scattering by unexcited dye molecules. The mechanism for enhancement of RSTRS and the shape of the bands in the spectra due to interference between two types of secondary radiation—RSTRS and stimulated luminescence—are discussed. Experimental data illustrating the different cases of formation of the RSTRS line profile are discussed. An analysis is made of the criteria that can be used to determine the electronic state in which RSTRS takes place. (16 refs.)

100408 The $B^2\Sigma^+$-$X^2\Sigma^+$ system of SrF: precise spectroscopic constants from a combined fit of microwave and sub-Doppler optical spectra. W.E.Ernst, J.O.Schroder (Inst. fur Molekulphys., Freie Univ. Berlin, Berlin, Germany).
Chem. Phys. (Netherlands), vol.78, no.3, p.363-8 (1 Aug. 1983).
Doppler-free polarization spectroscopy has been used to measure 295 lines in the (0,0), (1,1) and (2,2) bands of the $B^2\Sigma^+$-$X^2\Sigma^+$ system of SrF. These optical data were combined with the results of separate microwave measurements of the $X^2\Sigma^+$ state in a weighted least-squares fit. The accuracy of spectroscopic constants of the $B^2\Sigma^+$ state is remarkably improved by the reduction of the upper-state-lower-state correlations. A more reliable determination of the vibrational dependence of rotational and spin-rotation parameters became possible. (13 refs.)

100409 Anion radicals of bacteriochlorophylls c, d, and e. Likely electron acceptors in the primary photochemistry of green and brown photosynthetic bacteria. J.Fajer, I.Fujita, A.Forman, L.K.Hanson (Dept. of Energy & Environment, Brookhaven Nat. Lab., Upton, NY, USA), G.W.Craig, D.A.Goff, L.A.Kehres, K.M.Smith.
J. Am. Chem. Soc. (USA), vol.105, no.12, p.3837-43 (15 June 1983).
Representative redox, optical, ESR and ENDOR data and molecular orbital calculations are reported for the anion radicals of the homologous bacteriochlorophylls and bacteriopheophorbides c, d, and e. The chromophores (Chlorobium chlorophylls) have previously been identified or are suspected to exist in the reaction centers of green (c and d) and brown (e) photosynthetic bacteria which appear to straddle green plants and purple bacteria on an evolutionary

scale. An early role in the light-driven electron-transport chain of these bacteria is proposed for the Chlorobium chlorophylls. Diagnostic optical and electron paramagnetic spectral signatures are presented for the anion radicals which distinguish them from subsequent acceptors and would identify them in vivo. (46 refs.)

100410 A new spectrum of the PO_2 radical. R.D.Verma, C.F.McCarthy (Dept. of Phys., Univ. of New Brunswick, Fredericton, NB, Canada).
Can. J. Phys. (Canada), vol.61, no.8, p.1149-59 (Aug. 1983).
A new spectrum in the region 3115-2680 Å has been obtained in absorption by a flash discharge technique, and is attributed to the PO_2 radical. Vibronic and *K* structure analyses are performed which show conclusively that the new spectrum is analogous to the 2490 Å system of NO_2, and thus represents the $2^2B_2 \leftarrow \tilde{X}^2A_1$ transition of the PO_2 radical. The vibronic assignments are confirmed by an isotopic study of the spectrum using oxygen-18. The various frequencies obtained are: $\omega_1^{0,}=936\pm1$ cm^{-1}, $\omega_2^{0,}=396\pm1$ cm^{-1}, and $v_2''=505\pm4$ cm^{-1}. A predissociation is observed from which an upper limit to the energy of dissociation into $P+O_2$ is set at 35500 ± 100 cm^{-1}. (11 refs.)

100411 Electronic spectra of n-aminoazo dyes adsorbed on surfaces of alumosilicate catalysts and their quantum chemical interpretation. V.V.Goncharuk, A.G.Grebenyuk, L.I.Savranskii.
J. Appl. Spectrosc. (USA), vol.37, no.4, p.1160-5 (Oct. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.4, p.607-13 (Oct. 1982).
The elucidation of the rules for selection of active acid-base catalysts requires knowledge of the nature of the acid centers at which one reaction or another takes place. The most widely applied technique for the study of the nature of the acid centers is electronic spectroscopy of dye molecules adsorbed on the catalyst surface, which undergo significant changes in their optical properties due to the interaction with the acid centers on the surface. Application of electronic spectroscopy is limited by the difficulties in the interpretation of the absorption bands. On the basis of the experimental data alone it is not possible to give a strict and unique interpretation of the observed spectra, since one and the same type of center on the catalyst surface may be manifested by spectral phenomena which differ greatly from one another when the centers interact with different functional groups of the dye. Therefore, the role of quantum chemistry is increased, which, by operating on the experimental data, may provide a universal method for the description of the elementary steps of adsorption and catalysis. The authors have performed an experimental spectrophotometric study of the interaction of p-aminoazobenzene, o-tuluolazotoluidine, and phenylazonaphthylamine with the surface of catalysts consisting of opaque kaolinite in the forms monocation-substituted with Mg, Ca, Sr, and Ba, and they have carried out quantum chemical calculations for various models of the interaction of the dyes with the acid centers, in particular with protons of various types. 33.20N Vacuum ultraviolet spectra

100412 Investigation of $\pi\pi^*$ absorption bands of pyridine, pyrazine, and pyrimidine dissolved in liquefied gases. 270-185-nm region. G.Ya.Zelikina, T.B.Mamchenko, T.G.Meister.
Opt. & Spectrosc. (USA), vol.54, no.1, p.48-50 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.85-9 (Jan. 1983).
The $\pi\pi^*$ absorption bands of solutions of pyridine, pyrazine (1,4-diazine), and pyrimidine (1, 3-dyazine) in liquefied krypton, xenon, and Freon-14 (CF_4) have been recorded for the first time at different temperatures. Because of the similarity of the π electronic systems of the molecules investigated and benzene in the ground electronic state, the resulting spectra are compared with the spoectra of benzene. It was concluded, on the basis of this comparison, that the π electron systems of pyridine molecules in $\pi\pi^*$ excited states $^1B_{2u}$ and $^1B_{1u}$ as well as of pyrazine and pyrimidine in the $^1B_{1u}$ state are similar to that of benzene. On excitation of the diazines to the $^1B_{2u}$ state their π electronic systems differ markedly from that of benzene (in the corresponding electronic states). (15 refs.)

33.20R X-ray spectra

100413 Molybdenum K-edge extended X-ray absorption fine structure (EXAFS) studies of synthetic Mo-Fe-S clusters containing the MoS_4 unit: development of a fine adjustment technique based on models. Boon-Keng Teo (Bell Labs., Murray Hill, NJ, USA), M.R.Antonio, B.A.Averill.
J. Am. Chem. Soc. (USA), vol.105, no.12, p.3751-62 (15 June 1983).
The Mo K-edge extended X-ray absorption fine structure (EXAFS) spectra of the binuclear dianionic complexes $[S_2MoS_2FeL_2]^{2-}$ (1, L=SPh; 2, L=Cl; 3, L=OPh; Et_4N^+ salts), the trinuclear complexes $[S_2MoS_2FeS_2Fe(S\text{-}p\text{-}CH_3C_6H_4)_2]^{3-}$ (4, Et_4N^+ salt), $[S_2MoS_2FeS_2MoS_2]^{3-}$ (5, Et_4N^+ salt) and $[Cl_2FeS_2MoS_2FeCl_2]^{2-}$ (6, Ph_4P^+ salt), as well as the NH_4^+ salt of $[MoS_4]^{2-}$ (7), have been measured in the transmission mode. Data analysis using theoretical amplitude and phase functions provided better than 1 and 2% accuracy for the Mo-S and Mo-Fe distances, respectively. To improve the accuracy as well as to provide a reliable measure of the number of neighbors, a technique for fine adjustment based on models (FABM) was developed. The FABM technique relies upon a detailed exploration of the multidimensional parameter correlation space in the curve fitting, from which a simple method has been devised to alleviate parameter correlation problems. Terminal and bridging Mo-S distances for 1-5 can also be determined quite accurately from the average M0-S distance and the distance spread estimated from the Debye-Waller factor as determined by EXAFS. The EXAFS technique also allows accurate determination of metal-ligand distances in $[S_2MoS_2FeCl_2]^{2-}$, for which a twofold static disorder results only in average distances being obtainable from single-crystal X-ray crystallography. (46 refs.)

100414 X-ray spectroscopic studies of copper compounds and complexes in aqueous solution and polycrystalline form. P.N.Koul (Dept. of Phys., Regional Engng. Coll., Kashmir, India), B.D.Padalia.
X-ray Spectrom. (GB), vol.12, no.3, p.128-31 (July 1983).
K-absorption edge-shifts of copper in $CuCl_2$-$2H_2O$ $CuSO_4$-$5H_2O$, $Cu(NO_3)_2$-$3H_2O$, $Cu(en)_3Cl_2$, $Cu(en)_3SO_4$ and $Cu(en)_3(NO_3)_2$ in aqueous solutions as well as in polycrystalline form were measured using the X-ray absorption spectroscopic techniqiue. Effective charge on copper ions are estimated using the method of Gianturco and Coulson. The study reveals interesting results regarding the nature of chemical bonding. An attempt is made to interpret the results in the light of the available data on these samples. (21 refs.)

On a site-selective EXAFS experiment using optical emission .... See Entry 102992

33.25 NUCLEAR MAGNETIC RESONANCE AND RELAXATION; NUCLEAR QUADRUPOLE RESONANCE (NQR)

100415 Molecular solutes in nematic liquid crystals: orientational order and electric field gradients. G.N.Patey, E.E.Burnell (Dept. of Chem., Univ. of British Columbia, Vancouver, BC, Canada), J.G.Snijders, C.A.de Lange.
Chem. Phys. Lett. (Netherlands), vol.99, no.3, p.271-4 (5 Aug. 1983).
The difference between liquid-crystal and gas-phase values for the nuclear quadrupole coupling constant in D_2 and HD is used to obtain the mean electric field gradient in various liquid crystals. Order parameters for small molecules dissolved in liquid crystals are calculated assuming that the orientational order arises from the interaction of the molecular quadrupole moment with the average field gradient. The results obtained are in good agreement with experimental values for hydrogen and several other solutes. (26 refs.)

100416 Empirical force field calculations. XXII. Preferred conformations and barriers, to rotation in (2,2-dimethylpropyl)benzene and (1-tert-butyl-2,2-dimenthylpropyl)benzene. J.M.A.Baas, J.B.Vergouwe, M.A.Hoefnagel, B.van de Graaf (Lab. of Organic Chem., Delft Univ. of Technol., Delft, Netherlands).
Delft Prog. Rep. (Netherlands), vol.8, no.2, p.139-46 (June 1983).
The conformational preference of (2,2-dimethylpropyl)benzene (1) and (1-tert-butyl-2,2-dimethylpropyl)benzene (2) has been studied by ^{13}C NMR spectroscopy and by molecular mechanics. It appears that the aliphatic side chain of 2 is located asymmetrically with respect to the ortho and meta positions of the aromatic ring and exchanges slowly between equivalent positions ($\Delta G_{445}^{\neq}=99$ kJ mol^{-1}). The $\Delta H^{\neq}$-values of the barriers to rotation around the aryl-alkyl bonds in 1 and 2 are estimated with molecular mechanics calculations using two empirical force fields: 1: 24.8 and 20.3 kJ mol^{-1}; 2: 96.5 and 98.9 kJ mol^{-1}. (20 refs.)

100417 Solid-state NMR studies of the reactions of silica surfaces with polyfunctional chloromethylsilanes and ethoxymethylsilanes. D.W.Sindorf, G.E.Maciel (Dept. of Chem., Colorado State Univ., Fort Collins, CO, USA).
J. Am. Chem. Soc. (USA), vol.105, no.12, p.3767-76 (15 June 1983).
The silylation of silica surfaces by dimethyldichlorosilane, methyltrichlorosilane, dimethyldiethoxysilane, and methyltriethoxysilane has been studied by solid-state ^{29}Si and ^{13}C NMR, by use of cross polarization (CP) and magic-angle spinning (MAS). An earlier formalism for the quantitative analysis of the NMR data has been extended for use with polyfunctional silylating agents and applied in detail to dimethyldichlorosilane reactions. Silylation with ethoxysilane reagents is less amenable to quantitative interpretation but appears to parallel closely the behavior of analogous chlorosilane reagents. With ethoxysilane reagents ^{13}C NMR is quite useful, especially for determining the fate of ethoxy groups. In all of the cases studied, the products are characterized primarily by single silane-to-surface attachments of each silane silicon atom. The presence of adsorbed water is found to play an important role in the course and rate of the silylation reactions, especially those employing ethoxysilane reagents. The NMR data are used to address the question of 'horizontal' and 'vertical' polymerization within the 'silane phase' on the silica surface. (18 refs.)

100418 EPR evidence on molecular and electronic structure of nitrogen trifluoride radical cation. A.M.Maurice, R.L.Belford (School of Chem. Sci., Univ. of Illinois, Urbana, IL, USA), I.B.Goldberg, K.O.Christe.
J. Am. Chem. Soc. (USA), vol.105, no.12, p.3799-802 (15 June 1983).
Computer simulations of the EPR spectra of rigid $^{14}NF_3^+$. and $^{15}NF_3^+$. trapped in powdered NF_4AsF_6 at 25K show characteristics of a trigonal pyramid with the following principal values for the coupling matrices: $|g(\|,\perp)|=2.003$; $|A(^{14}N)(\|,\perp)|=324$, 187 MHz; $A(^{15}N)(\|,\perp)|=451$, 260 MHz; $A(^{19}F)(z,x,y)=880$, 340, 360 MHz; α, the angle between parallel axes for A_F and A_N, $=15°$. The nitrogen p:s spin-density ratio (computed from the nitrogen hyperfine splittings) is consistent with $sp^{2.5}$ nitrogen hybrids in the NF bonds and with a pyramid angle of about 105°. Although the same pyramid angle appears to agree with the orientation of the principal axis of the fluorine hyperfine coupling matrix ($|\alpha|=15°$, pyramid angle$=90°+|\alpha|$), electronic structure computations imply that α is negative and that the agreement is fortuitous. Some comparisons are made with isoelectronic radicals BF_3^- and CF_3—the latter being essentially tetrahedral with sp^3 hybridization. (19 refs.)

100419 ^{13}C NMR of arylgermanes and arylgermyl anions. Main-group elements as anionic π-donor substituents. II. R.J.Batchelor, T.Birchall (Dept. of Chem., McMaster Univ., Hamilton, Ontario, Canada).
J. Am. Chem. Soc. (USA), vol.105, no.12, p.3848-52 (15 June 1983).
^{13}C NMR spectra of the compounds $(C_6H_5)_nGeH_{4-n}$ and $(C_6H_5)_nGeH_{3-n}Na$ (*n*-1, 2, 3) as well as $(p\text{-}CH_3C_6H_4)_3GeM$ (M=H, Na) have been recorded and assigned. Comparison of the chemical shifts with those of analogous group 5B compounds demonstrates that the extent of delocalization of the negative charge of the germyl anions into the aromatic rings is significantly less than that found in the anions of phenyl-substituted phosphines and arsines. The distribution of π electrons in monosubstituted benzenes whose

substituents are anionic centers appears to be the result of the balance between mesomeric effects and a polarization dependent upon the degree to which the negative charge is localized on the substituent atom. The magnitudes of these effects depend somewhat on the extent and nature of solute-solvent interaction, ion pairing, and association in the solutions of these salts which in turn are a function of the polarity of the solvent. (22 refs.)

100420 Carbon-13 magnetic resonance of hydroaromatics. II. Conformation of tetralin and tetrahydroanthracene and their methyl derivatives. F.G.Morin, W.J.Horton, D.M.Grant, D.K.Dalling, R.J.Pugmire (Dept. of Chem. & Fuels Engng., Univ. of Utah, Salt Lake City, UT, USA).
J. Am. Chem. Soc. (USA), vol.105, no.12, p.3992-8 (15 June 1983).
For pt.I see ibid., vol.103, p.4817 (1981). Carbon-13 chemical shift data have been acquired for 36 methylated tetralines and tetrahydroanthracenes. A least-squares regression analysis has been undertaken on the ring carbons of compounds of unequivocal conformation to determine methyl substituent paramters for the two distinct aliphatic positions and the results have been used to estimate the position of equilibrium of conformationally mobile compounds. 1-methyltetralin exists in essentially equally populated conformers, at room temperature but that the 2-methyl derivative is dominated by the conformation with an equatorial methyl group. Substituent parameters are compared with those previously determined for methylated cyclohexanes. A similar analysis of the methyl chemical shifts was unsuccessful owing, in part, to the highly flexible nature of the saturated ring. (38 refs.)

100421 Multiple conformational states of a Pro-Pro peptide. Solid-state and solution conformations of Boc-Aib-Pro-Pro-NHMe. H.Balaram, B.V.V.Prasad, P.Balaram (Molecular Biophys. Unit, Indian Inst. of Sci., Bangalore, India).
J. Am. Chem. Soc. (USA), vol.105, no.12, p.4065-71 (15 June 1983).
The solid-state and solution conformations of the model peptide Boc-Aib-Pro-Pro-NHMe have been studied by X-ray diffraction and NMR. The peptide adopts a poly(proline II) conformation in the solid state. Two molecules are observed in the asymmetric unit differing in the geometry (cis/trans) of the urethane group. The molecules are held together in the crystal by a complex network of hydrogen bonds involving three molecules of water, which cocrystallize. Dissolution of single crystals at low temperature (~233K) permits NMR observation of the solid-state conformer. In solution, the peptide undergoes a trans-cis isomerization of the Pro-Pro bond. Low-temperature NMR measurements allow the detection of three conformational states of the Pro-Pro segment. Both cis′ and trans′ rotational isomers about the C^{α}-CO (ψ) bond of Pro-3 are detectable at low temperatures. Theoretical calculations suggest an appreciable activation barrier to ψ rotation. Temperature and solvent dependence of NH chemical shifts provide evidence for an intramolecular hydrogen bond, involving the NHMe group in the cis Pro-Pro conformer. Energy calculations suggest the possibility of a type VI β-turn conformation stabilized by a 4→1 hydrogen bond between the Aib-1 CO and NHMe groups. (37 refs.)

100422 Calculation of the diamagnetic spin-orbit contribution to the nuclear spin-spin coupling tensors in the water molecule. V.Galasso (Istituto di Chimica, Univ. di Trieste, Trieste, Italy), P.Lazzeretti, E.Rossi, R.Zanasi.
J. Chem. Phys. (USA), vol.79, no.3, p.1554-6 (1 Aug. 1983).
The note is aimed at investigating some previously unexplored aspects of the basis dependence of the theoretical estimates. This is performed by retaining a Gaussian set of expansion for the case of ^{1}J(O,H) and ^{2}J(H,H) in the water molecule, with particular attention to size, flexibility, contraction, and role of polarization functions. (22 refs.)

100423 Tensorial analysis of the hyperfine interaction operator by extensive use of Racah algebra and of translational invariance. L.Brehamet (IRF DB/SBPh, CENS, Gif-sur-Yvette, France).
J. Math. Phys. (USA), vol.24, no.8, p.1968-72 (Aug. 1983).
Strict application of Racah algebra gives an efficient way of deriving the tensorial form of the hyperfine interaction one-electron operator involved in NMR spin coupling effects. In particular, this procedure avoids the use of classic explicit arguments of integration around the origin to find the Fermi-contact term. The linear momentum is retained in its explicit translationally invariant form as long as possible during the calculations. This allows the tensorial expansion of the operator to be obtained rapidly at any origin of coordinates. The reduced matrix elements of interest are given by new general closed expressions in the *j-j* coupling scheme. (27 refs.)

100424 Evaluation of ^{1}H nuclear magnetic resonance spin-lattice relaxation times facilitated by analogous ^{13}C studies, illustrated by studies of 1,3,5-trimethylbenzene. J.Homer, E.R.V.Cedeno (Chem. Dept., Univ. of Aston, Birmingham, England).
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.7, p.1021-9 (July 1983).
It is shown that in certain situations ^{13}C n.m.r. spin-lattice relaxation time and n.O.e. studies may be used to separate ^{1}H relaxation times into intra- and inter-molecular components. The approach, which applies only when the carbon and hydrogen atoms are considered subject to the same overall molecular motion, does not depend on the theoretical evaluation of any parameters intrinsically involved in the characterization of the relaxation times. However, it is shown that simple geometrical calculations can facilitate the evaluation of equivalent rotational correlation times from both ^{13}C and ^{1}H intramolecular relaxation rates and that the constituents of the latter can be readily isolated. The overall approach is illustrated by studies of the aryl carbon and hydrogen nuclei of 1,3,5-trimethylbenzene dissolved in carbon tetrachloride and in mixtures of cyclohexane and tetramethyl silane. (17 refs.)

100425 The determination of absolute configuration using nuclear magnetic resonance techniques. R.L.Rinaldi (Dept. of Chem., Case Western Reserve Univ., Cleveland, OH, USA).
Prog. Nucl. Magn. Resonance Spectrosc. (GB), vol.15, pt.4, p.291-352 (1982).
This review of NMR techniques for determining absolute configurations of chiral organic compounds covers the literature extensively through to the end of 1981. It is not intended to be an exhaustive compilation of NMR studies, and for this apologies are made to the many authors whose worthwhile achievements are not included. After a brief description of the primary technique used for absolute configurational assignments, measurement of optical activity, short summaries of the major NMR reagents utilized for configurational assignments are given. These NMR reagents include diamagnetic chiral solvating agents (CSA), chiral lanthanide shift reagents (CLSR), chiral derivatizing agents (CDA), and the use of both archiral and chiral paramagnetic shift reagents to enhance the observed chemical shift differences of diastereomeric derivatives. The main section of this review is the organized according to the major functional group categories which have been studied. To limit the size of this review to an acceptable length, studies involving the determinations of relative configurations of diastereomeric compounds are not included; only diastereomeric derivatives which have been prepared specifically for the purpose of assigning absolute configurations of enantiomeric compounds are considered. (130 refs.)

100426 Study of the structure of branched oligoesters by NMR spectroscopy method. P.P.Sukhanov, V.S.Minkin, V.I.Kimel'blat, V.V.Zykova, V.P.Dorozhkin.
Vysokomol. Soedin. Ser. A (USSR), vol.25, no.7, p.1370-6 (July 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*
The structure of branched oligoesters synthesized by polycondensation using a trifunctional branching agent—1,1,1-trimethylpropane—is analysed basing on the high resolution NMR data. Features of chemical structure related to various densities of branching points and compositions of reaction mixture are shown. (11 refs.)

100427 ^{19}F NMR study of direction of opening of epoxide ring in non-catalytic interaction of α-oxides with phenols and alcohols. B.A.Komarov, V.P.Volkov, G.N.Boiko, E.S.Naidovskii, B.A.Rozenberg.
Vysokomol. Soedin. Ser. A (USSR), vol.25, no.7, p.1431-5 (July 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*
Trifluoroacetates of products of non-catalytic interaction of phenylglycidyl ester with phenol and alcohols have been studied by ^{19}F NMR. Reactions were performed in the absence of solvent at 140 and 180°. Independently of conditions and degree of conversion besides the normal opening of epoxide cycle the abnormal one was shown to proceed with the ratio of these processes being 4:3. (15 refs.)

33.30 ELECTRON PARAMAGNETIC RESONANCE AND RELAXATION

100428 Flash photolysis electron spin resonance and CIDEP studies of radicals derived from nitrogen heterocyclics. I. The diazanaphthalenes. S.Basu, K.A.McLauchlan, A.J.D.Ritchie (Phys. Chem. Lab., Univ. of Oxford, Oxford, England).
Chem. Phys. (Netherlands), vol.79, no.1, p.95-103 (15 Aug. 1983).
Radicals formed by hydrogen abstraction from suitable quenchers by the excited states of four isomeric diazanaphthalene molecules have been identified and their chemically-induced electron spin polarization (CIDEP) behaviour studied. Quinoxaline and quinazoline react via their spin-polarized triplet states, phthalazine via its unpolarized triplet state and cinnoline through both its singlet and polarized triplet states. The phase of the latter polarization was not as expected. A feature has been the deliberate generation of a phenoxy radical with a clearly-resolved hyperfine structure for use as a probe of complex CIDEP behaviour. Its analysis has been significant in elucidating the reactions of both excited states and radicals. (19 refs.)

33.35 DOUBLE RESONANCES AND OTHER MULTIPLE RESONANCES

100429 Rotational inelastic transitions in OCS using a tunable diode laser and a frequency doubled CO_2 laser. A.Picard-Bersellini, B.J.Whitaker, Ph.Brechignac (Lab. de Photophysique Moleculaire, CNRS, Orsay, France).
J. Chem. Phys. (USA), vol.79, no.3, p.1556-7 (1 Aug. 1983).
The self-perturbation of the OCS molecule in the gas phase has been extensively studied by line broadening measurements in the MW and IR regions for a large number of rotational levels. MW-MW double resonance has also been widely used and more recently IR-MW double resonance. Other types of experiment which analyze transient optical coherences have provided information on the dephasing relaxation time of MW transitions T_2. The authors report the first observation of transient IR-IR double resonance in this molecule. (20 refs.)

100430 Pulsed ENDOR spectroscopy of the interior protons of free-base porphin in its lowest photoexcited triplet state, in an *n*-octane single crystal. W.A.J.A.van der Poel, D.J.Singel, J.Schmidt, J.H.van der Waals (Huygens Lab., Univ. of Leiden, Leiden, Netherlands).
Mol. Phys. (GB), vol.49, no.5, p.1017-28 (10 Aug. 1983).
Through the use of the pulsed ENDOR technique, the authors have obtained the magnetic resonance spectra of the interior protons of free-base porphin in its lowest photoexcited triplet state in a single crystal of *n*-octane. The values of the components, in the fine structure principal axis system, of the proton-electron hyperfine interaction have been ascertained, and clearly illustrate a departure from D_{2h} molecular symmetry. The measured tensors have been used to obtain the spin densities at the porphin nitrogen atoms, and the locations of the protons within the ring. (35 refs.)

33.35H MODR and PMDR (microwave optical double resonance and phosphorescence microwave double resonance)

100431 Resonance Raman detected triplet state magnetic resonance. R.H.Clarke, D.J.Graham, E.B.Hanlon, P.Mitra (Dept. of Chem., Boston Univ., Boston, MA, USA).
J. Chem. Phys. (USA), vol.79, no.3, p.1549-50 (1 Aug. 1983).
The authors have recorded the zero-field magnetic resonance transitions of the photoexcited triplet state of chlorophyll *b* (chl *b*) by monitoring the microwave induced changes of the resonance Raman spectral band intensities. This

experiment offers an extension of optically detected magnetic resonance (ODMR) techniques whose applicability to investigations of the triplet states of organic molecules has been widely recognized. Resonance Raman detected ODMR is expected to offer an advantage over the traditional phosphorescent and nonphosphorescent ODMR techniques in cases involving large, complex molecular systems, where the utilization of Raman scattering bands may provide high resolution, optical filtering capabilities superior to alternative methods detecting on broadband emissive or absorptive features. (2 refs.)

100432 Laser spectroscopy and microwave-optical double resonance ICL $A^3\Pi(1)$ $\nu=19$ of a supersonic expansion. S.G.Hansen, J.D.Thompson, C.M.Western, B.J.Howard (Phys. Chem. Lab., Univ. of Oxford, Oxford, England).
Mol. Phys. (GB), vol.49, no.5, p.1217-29 (10 Aug. 1983).
The 19-0 band of the $I^{35}Cl$ $A^3\Pi(1)$-$X^1\Sigma^+$ system is examined at sub-Doppler resolution using a single mode dye laser and a supersonic jet. Complex hyperfine structure is resolved and assigned with the aid of microwave-optical double resonance spectroscopy. Twenty-two microwave transitions were observed within the excited vibronic state and the subsequent analysis results in values for the rotational constant, Ω-doubling constant, two electric quadrupole constants and a magnetic hyperfine constant. (23 refs.)

Precise determination of the $^{171}Yb^+$ ground state hyperfine separation ....See Entry 100588

33.40 MÖSSBAUER SPECTRA

100433 Hartree-Fock-Slater LCAO calculation of the Mossbauer parameters of some antimony compounds. W.Ravenek, J.W.M.Jacobs, A.van der Avoird (Inst. of Theoretical Chem., Univ. of Nijmegen, Nijmegen, Netherlands).
Chem. Phys. (Netherlands), vol.78, no.3, p.391-404 (1 Aug. 1983).
Describes a (non-empirical) Hartree-Fock-Slater ($X\alpha$) LCAO study of the Mossbauer parameters in a series of thirteen Sb compounds: SbX_3(X=F, Cl, Br, I), $Sb(CH_3)_NCl_{3-N}$(N=1, 2, 3), SbX_5 (X=F, Cl) and $Sb(CH_3)_3X_2$(X=F, Cl, Br, I), in relation with the chemical bonding in these compounds. The calculated isomer shifts agree very well with the experimental data: correlation coefficient 0.99, $\Delta R/R=-1.08\times10^{-3}$. The quadrupole splitting for the Sb(III) compounds is consistently (correlation coefficient 0.97) too small by a factor of 2.7, for the Sb(V) compounds the results are more scattered and even smaller. The proportionality factor could be partly due to the uncertainty in the ^{121}Sb nuclear quadrupole moment and partly to the neglect of core polarization effects in the (frozen core) HFS LCAO calculations. Test calculations on HCl, which are also reported, show that the HFS LCAO method can yield accurate core polarization corrections to the quadrupole splitting (Sternheimer factors), but only at the cost of an expensive numerical integration scheme. The results suggest further that the structures of some of the Sb compounds might be different from what has previously been proposed. (68 refs.)

100434 Mossbauer and infrared studies of matrix-isolated iron-carbonyl complexes. C.H.F.Peden, S.F.Parker (Dept. of Chem., Univ. of California, Santa Barbara, CA, USA), P.H.Barrett, R.G.Pearson.
J. Phys. Chem. (USA), vol.87, no.13, p.2329-36 (23 June 1983).
The matrix-isolated binary carbonyls, $Fe(CO)_x$, $x\leq5$, and $Fe_2(CO)_y$, $y=8,9$, formed upon cocondensation of iron atoms with noble gas/CO gas mixtures have been investigated by infrared and Mossbauer spectroscopies. Assignments for the Mossbauer absorptions of these species are made. New information on the C-O stretching frequencies of $Fe(CO)_2$ has been obtained. The very low infrared stretching frequency (1898 cm^{-1}) and the negative Mossbauer isomer shift (−0.60 mm/s) of Fe(CO) are evidence for a large $d\pi\rightarrow\pi^*$ interaction for this fragment. (50 refs.)

33.45 MAGNETO-OPTICAL AND ELECTRO-OPTICAL SPECTRA; DICHROISM

100435 Circular dichroism studies on azole nucleosides. The solution conformation of 5-amino-1-β-D-ribofuranosylimidazole-4-carboxamide, bredinin, pyrazofurin, ribavirin, and related nucleosides. D.W.Miles (Dept. of Chem., Univ. of Utah, Salt Lake City, UT, USA), G.R.Revankar, R.K.Robins.
J. Phys. Chem. (USA), vol.87, no.13, p.2444-50 (23 June 1983).
The circular dichroism (CD) and UV absorption spectra of certain five-membered heterocycles are reported. The study includes 5-amino-1-β-D-ribofuranosylimidazole-4-carboxamide (AICAR) and important nucleoside chemotherapeutic agents such as bredinin, pyrazofurin, and ribavirin. Certain other closely related imidazole and triazole nucleoside analogues are included. The glycosidic conformations are determined by the comparison of the CD data with theoretical predictions of rotational strength as a function of the glycosidic conformation. The optically active electronic transitions are characterized by the effects of substituent perturbation on their structure as reflected by transition monopole maps and the signed character of the rotational strength-torsion angle wheels. (31 refs.)

100436 Magnetic circular dichroism and anomalous fluorescence spectra of azulenothiophenes. H.Yamaguchi, H.Shimoishi, M.Ata (Dept. of Chem., Kumamoto Univ., Kumamoto, Japan), H.Baumann, C.Morini, K.Yamane.
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.7, p.1155-63 (July 1983).
The magnetic circular dichroism and electronic absorption spectra of azuleno[1,2-*b*]thiophene and azuleno[2,1-*b*]thiophene, which are iso-π-electron systems of benz[*a*]azulene, have been measured. The absorption bands of both azulenothiophenes are interpreted by using these observed spectra and the results of molecular-orbital calculations. The anomalous fluorescence spectra have been observed for both azulenothiophenes and benz[*a*]azulene. From the assignment of the absorption spectra, it has been concluded that these compounds emit the fluorescence from the second excited singlet state. (32 refs.)

33.45B Zeeman and Stark effects

100437 Optical Stark effects on pure-spin Raman transitions in molecular oxygen. A.Owyoung, R.A.Hill, P.Esherick (Sandia Nat. Labs., Albuquerque, NM, USA).
Opt. Lett. (USA), vol.8, no.8, p.425-7 (Aug. 1983).
Fully resolved pure-spin Raman transitions near 2 cm^- have been observed in $^3\Sigma_g$ gound-state molecular oxygen using stimulated Raman techniques. Anomalous differences between polarized and depolarized spectra are fully explained in terms of optical Stark effects. (13 refs.)

Two-photon optical multistability ....See Entry 100833

33.50 FLUORESCENCE, PHOSPHORESCENCE; RADIATIONLESS TRANSITIONS (INTERSYSTEM CROSSING, INTERNAL CONVERSION)

100438 Solvent and pH dependence of fluorescence spectra of 9-phenanthrylamine. M.Swaminathan, S.K.Dogra (Dept. of Chem., Indian Inst. of Technol., Kanpur, India).
Can. J. Chem. (Canada), vol.61, no.6, p.1064-6 (June 1983).
Fluorimetric titrations were carried out for various forms of 9-phenanthrylamine and pK_a* values were determined. An unusual behaviour observed in the fluorimetric titration of the neutral form at moderate proton concentration is due to the quenching of the S_1 state of PNH_2 by H^+. (12 refs.)

100439 Coriolis interactions and intramolecular vibrational redistribution in jet-cooled pyrimidine. K.T.Chen, B.E.Forch, E.C.Lim (Dept. of Chem., Wayne State Univ., Detroit, MI, USA).
Chem. Phys. Lett. (Netherlands), vol.99, no.2, p.98-100 (29 July 1983).
Evidence is presented which indicates that the second-order Coriolis interactions play an important role in intramolecular vibrational redistribution. (6 refs.)

100440 Kinetics of excited-state proton transfer of doubly protonated 3-aminoacridine. B.S.Vogt, S.G.Schulman (Coll. of Pharmacy, Univ. of Florida, Gainesville, FL, USA).
Chem. Phys. Lett. (Netherlands), vol.99, no.2, p.157-60 (29 July 1983).
3-aminoacridine has been used to extend the quantitation of excited-state proton-transfer kinetics in concentrated acid media to ≈13 M sulfuric acid. The hydration requirement of the reaction and the reasons for its not attaining equilibrium within the lifetime of the excited state are discussed. (13 refs.)

100441 Oscillatory continuum emission from IBr. M.MacDonald, J.P.T.Wilkinson, C.Fotakis, M.Martin, R.J.Donovan (Dept. of Chem., Univ. of Edinburgh, Edinburgh, Scotland).
Chem. Phys. Lett. (Netherlands), vol.99, no.3, p.250-2 (5 Aug. 1983).
Optical excitation of IBr at 193 nm (ArF laser) leads to strong fluorescence in the region 280-460 nm. This fluorescence is dominated by two oscillatory continua resulting from bound-free radiative transitions. (10 refs.)

100442 Photoinduced electron transfer between aromatic hydrocarbons and arene diazonium salts in micellar solutions. H.-J.Timpe, G.Israel, H.G.O.Becker (Tech. Univ. Carl Schorlemmer Leuna-Merseburg, Merseburg, Germany), I.R.Gould, N.J.Turro.
Chem. Phys. Lett. (Netherlands), vol.99, no.3, p.275-80 (5 Aug. 1983).
In micellar sodium dodecylsulfate (SDS) solution ground-state charge-transfer complexes between aromatic hydrocarbons and diazonium salts can be detected by UV absorption. The hydrocarbon fluorescence quenching occurs by both static and dynamic mechanisms and can be described by an established kinetic scheme. (20 refs.)

100443 Non-Condon scheme of radiationless transitions for the Morse oscillator model. A.L.Sobolewski (Inst. of Phys., Polish Acad. of Sci., Warsaw, Poland).
Chem. Phys. (Netherlands), vol.78, no.2, p.265-78 (15 July 1983).
The nonadiabatic coupling matrix elements responsible for radiationless deactivation of an electronically excited molecule are calculated without invoking the Condon approximation. Assuming the Morse potential surfaces for vibrational motion along the local and totally symmetric normal coordinates, the vibronic part of the radiationless rate constant is calculated. It is shown that the rate constant in the non-Condon scheme exceeds that obtained in the Condon approximation by about two orders of magnitude. The calculated dependence of the radiationless rate constant in the energy gap is in good agreement with the experimentally observed energy gap law for intersystem crossing $T_1\rightarrow S_0$ rate constants in aromatic hydrocarbons. (35 refs.)

100444 Viscosity dependence of internal conversion rates of polyatomic molecules. K.-E.Susse, D.-G.Welsch, I.Madzgalla (Sektion Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany).
Chem. Phys. (Netherlands), vol.78, no.3, p.443-62 (1 Aug. 1983).
A microscopic theory of the dependence of internal conversion rates (R) on viscosity (η) is developed by extending usual theories of vibronic energy relaxation. The viscosity dependence of R is assumed to arise from the viscosity dependence of the damping rates γ of soft (torsional) modes of intramolecular vibration (frequencies ω). From the theory developed R is found to increase with η when $\gamma\ll\omega$. Then $\gamma\gtrsim\omega$ the rate R is found to decrease with η. In this case the dependence of R on η can often be approximated in a wide range of η according to $R\propto\eta^{-\alpha}$. The value of α depends on certain microscopic parameters, and $0\leq\alpha<1$ and $\alpha\geq1$ might be found. In particular, the oster-Nishijima result ($\alpha=1$) (1956) is included as a limiting case. A comparison between theory and experiment is given, which shows the theoretical results to be in full agreement with the experimental ones. (30 refs.)

100445 Nonexponential fluorescence decay of tryptophan, tryptophyglycine, and glycyltryptophan. M.C.Chang, J.W.Petrich, D.B.McDonald, G.R.Fleming (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA).
J. Am. Chem. Soc. (USA), vol.105, no.12, p.3819-24 (15 June 1983).
The photophysics and spectroscopy of tryptophyglycine, tryptophylalanine, glycyltryptophan, alanyltryptophan, glycyltryptophylglycine, and tryptophan itself has been investigated by using steady-state and subnanosecond spectroscopy. For tryptophan and the peptides where the tryptophyl residue is N-terminal the authors demonstrate the involvement of the state of protonation on both the excited-state dynamics and the absorption and emission spectra. The deprotonated amino group gives rise to red-shifted absorption and emission spectra and to a longer fluorescence decay time compared with the protonated form. pK_a values over a range of temperatures were determined for tryptophan (23°C, 9.50), tryptophylglycine (23°C, 7.84), and tryptophylalanine (23°C, 7.79). The temperature dependence of the amplitude of the long-decay component in tryptophylglycine is attributable to the temperature dependence of the ground-state pK_a. Examination of the Arrhenius plots for tryptophan, tryptophylglycine, and glycyltryptophan clarifies the role of the protonated amino group in fluorescence quenching. The authors suggest that the role of the protonated amino group in the fluorescence quenching of the N-terminal tryptophyl compounds is not proton transfer to the indole ring but an enhancement of charge transfer from the indole ring to the adjacent carbonyl group. (45 refs.)

100446 On the origin of nonexponential fluorescence decay in tryptophan and its derivatives. J.W.Petrich, M.C.Chang, D.B.McDonald, G.R.Fleming (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA).
J. Am. Chem. Soc. (USA), vol.105, no.12, p.3824-32 (15 June 1983).
The nonexponential fluorescence decay of tryptophan and its derivatives is discussed in terms of a simple model based on conformers about the C^{α}-C^{β} bond and the relative rates of charge transfer from indole to various electrophiles. Accurate predictions concerning the relative fluorescence lifetimes and the form of the fluorescence decay law are made for tryptophan and 17 of its derivatives, including three new derivatives synthesized specifically to test the model. (52 refs.)

100447 Laser-induced fluorescence excitation spectra of $NeCl_2$: evidence for a long-lived vibrationally excited van der Waals molecule. D.E.Brinza, B.A.Swartz, C.M.Western, K.C.Janda (Arthur Amos Noyes Lab. of Chem., California Inst. of Technol., Pasadena, CA, USA).
J. Chem. Phys. (USA), vol.79, no.3, p.1541-2 (1 Aug. 1983).
The authors report the fluorescence excitation spectra of $NeCl_2$ associated with the (9-1), (10-1), and (11-1) vibrational bands of the $B^3\Pi(0_u{}^+)$-$X^1\Sigma_g{}^+$ electronic transition of Cl_2, as well as with bands originating from vibrationally 'cold' Cl_2. They believe this to be the first observation of spectra in which the lower level is a metastable, vibrationally excited van der Waals molecule. (8 refs.)

100448 Collisional quenching of $A\ {}^2\Sigma^+$ OH at elevated temperatures. P.W.Fairchild, G.P.Smith, D.R.Crosley (Molecular Phys. Lab., SRI Internat., Menlo Park, CA, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.1795-807 (15 Aug. 1983).
Thermally averaged cross sections σ_Q for collisional quenching of the $A\ {}^2\Sigma^+$ state of the OH molecule have been measured near 1100K. The OH was produced and detected in a laser pyrolysis/laser fluorescence experiment, in which a mixture of SF_6, H_2O_2, and the collision partner M was heated by a pulsed CO_2 laser. Thermal decomposition of the peroxide produces OH which is then excited by a tunable laser; the real-time decay of the fluorescence signal at different pressures of M furnishes σ_Q. These σ_Q at elevated temperatures are generally less than the room temperature values. This result, the size of σ_Q, and its variation with M suggest the importance of attractive forces in the collisional quenching. The experimental results have been compared with a theoretical calculation of σ_Q based on multipole attractive forces with a repulsive centrifugal barrier. Good correlation is obtained for eight of the 11 quenchers studied: the experimental values of σ_Q for N_2 and SF_6 are conspicuously low. (22 refs.)

100449 Coriolis effects on intramolecular vibrational relaxation: rotational contour dependence of pyrimidine fluorescence. B.E.Forch, K.T.Chen, H.Salgusa, E.C.Lim (Dept. of Chem., Wayne State Univ., Detroit, MI, USA).
J. Phys. Chem. (USA), vol.87, no.13, p.2280-2 (23 June 1983).
The rotational contour dependence of the fluorescence of pyrimidine indicates that the second-order Coriolis interactions play an important role in intramolecular vibrational relaxation. (16 refs.)

100450 K_2 ground-state relaxation studies from transient process kinetics. M.P.Auzin'sh, R.S.Ferber, I.Ya.Pirags (Latvian State Univ., Riga, Latvian SSR).
J. Phys. B (GB), vol.16, no.15, p.2759-71 (14 Aug. 1983).
Relaxation parameters of the optically depopulated $(\nu'', J'')X^1\Sigma_g{}^+$ level of the K_2 molecule with $\nu''=1$ and $J''=72$ have been determined for thermal collisions with He, Ne, Ar, Kr and Xe atoms, using the method of laser-induced fluorescence kinetic monitoring. Rate constants of about 10^{-9} cm^3 s^{-1} and effective cross sections between 0.5×10^{-14} and 1.6×10^{-14} cm^2 have been obtained. Rectangular modulation of the He-Ne laser 628.8 nm intensity, exciting the transition $(1,72)X^1\Sigma_g{}^+\rightarrow(8,72)B^1\Pi_u$, was employed making it change periodically from depopulating to probing. The time dependence of the probe-beam-induced fluorescence directly reflects the transient process restoring the thermally equilibrated populations of the lower level (ν'', J''). The kinetic equations were solved in the classical-limit $J''\rightarrow\infty$ approximation, allowing for participation of two relaxation processes, namely collisions and collisionless exchange of molecules inside and outside the laser beam in their thermal motion. It is shown that the assumption of additive rates for both processes can lead to distortion of the concentration dependence of total relaxation rate. A description of the transient process is also given within the framework of irreducible tensor operators, permitting the authors to consider separately the contribution of population relaxation and of alignment. For the rovibronic state $(8,72)B^1\Pi_u$ from measurements of the degree of polarisation of the fluorescence it was found that cross sections for population and alignment relaxation coincide within 3% and would fit into the limits of the experimental error. (15 refs.)

100451 Nuclear hyperfine splittings for copper monofluoride in the $a^3\Sigma^+$ state. C.R.Brazier, J.M.Brown, M.R.Purnell (Dept. of Chem., Southampton Univ., Southampton, England).
J. Mol. Spectrosc. (USA), vol.99, no.2, p.279-87 (June 1983).
Lines in the (0,0) band of the $a^3\Sigma^+$-$X^1\Sigma^+$ system of CuF have been recorded at Doppler-limited resolution by laser-induced fluorescence. Nuclear hyperfine structure associated with the Cu nucleus is clearly resolved in many rotational lines. The features have been measured and used to determine molecular parameters for ^{63}CuF in the $a^3\Sigma^+$ state. The implications of the hyperfine parameters for the electronic wavefunction are discussed and are shown to be consistent with recent theoretical calculations. (13 refs.)

100452 Contraction of, and hole burning in a phosphorescence line corresponding to the forbidden $T_1 \Leftarrow S_0$ transition in the spectrum of pyrene in a glassy matrix. A.A.Gorokhovskii, V.V.Pal'm (Inst. of Phys., Acad. of Sci., Estonian SSR).
JETP Lett. (USA), vol.37, no.5, p.237-41 (5 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.5, p.201-4 (5 March 1983).
For the first time, a hole has been burned photochemically in the inhomogeneously broadened O-O spectrum of the $T_1 \leftarrow S_O$ transition of a complex organic molecule, specifically, the system of pyrene in a glassy matrix of butyl bromide (Py-BrBu), at 1.8 and 4.2K. The results are compared with the resonant laser excitation of the phosphorescence spectrum. (8 refs.)

100453 Direct observation of picosecond relaxation of high-lying electronic states of certain dye molecules in solution. A.M.Freiberg, K.E.Timpmann (Inst. of Phys., Acad. of Sci., Estonian SSR).
JETP Lett. (USA), vol.37, no.5, p.247-50 (5 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.5, p.209-12 (5 March 1983).
The picosecond decay times of the fluorescence from the second excited electronic state have been measured directly for certain polymethine dyes in solution. The decay times depend on the excitation conditions. (8 refs.)

100454 Anisotropy in light emission by Zn porphin molecules in n-octane single crystals. S.M.Arabei, K.N.Solov'ev, G.D.Egorova, S.F.Shkirman.
J. Appl. Spectrosc. (USA), vol.37, no.4, p.1154-7 (Oct. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.4, p.600-4 (Oct. 1982).
A method has been developed of determining the polarizations of individual vibronic transitions in a polyatomic molecule and the symmetries of the corresponding vibrations from the anisotropy in emission and absorption of Shpolskii single crystal systems. It is of interest to apply the method to porphin metal complexes, which represent simple model compounds for the biologically important tetrapyrrole pigments. The authors present results for Zn porphin obtained from the fluorescence anisotropy. The method involves analyzing the behavior of the relative intensities of the quasilines when the orientation of the n-alkane single crystal is varied. This intensity behavior occurs because of the identical orientations of the molecules in the impurity centers of a particular type together with certain features of the electric dipole anisotropy. The intensities of the components in the head multiplet may be reduced on rotating the crystal, and the same applies to the corresponding quasilines for the totally symmetric vibrations whose transition moments are polarized parallel to the purely electronic one. At the same time there will be an increase in the intensity for the quasilines for the vibrations lacking total symmetry, whose transition moments are polarized perpendicular to the purely electronic one. One can also obtain the converse picture: an increase in intensity for the totally symmetric vibration and weakening for the others. These experiments enable one to classify the vibrations by symmetry type. (10 refs.)

100455 Liquid-crystalline solvents as mechanistic probes. X. Dynamics of intramolecular quenching of pyrenyl fluorescence in the liquid-crystalline and isotropic phases of a cholesteric solvent. V.C.Anderson, B.B.Craig, R.G.Weiss (Dept. of Chem., Georgetown Univ., Washington, DC, USA).
Mol. Cryst. & Liq. Cryst. (GB), vol.97, no.1-4, p.351-63 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
For pt.IX see J. Phys. Chem., vol.86, p.4642 (1982). The effect of cholesteric order in a 59.5/15.6/24.9 (w/w/w) mixture of cholesteryl oleate/cholesteryl nonanoate/cholesteryl chloride (*C/M*) on the intramolecular fluorescence quenching of 1,3-bis(1-pyrenyl) propane (*P3P*) has been explored. A comparison with fluorescence quenching of N,N-dimethyl-4-[3-(1-pyrenyl)propyl]aniline (*P3D*) in *CM* is made. From the Arrhenius activation parameters for quenching in the cholesteric and isotropic phases, it is concluded that the motions which take the ground state conformers of *P3P* to their quenching transition state are nearly impervious to macroscopic *CM* mesophase order: in the cholesteric phase, $E_a{}'=10.5\pm0.4$ kcal mol^{-1} and $\Delta S^{\ddagger}=1\pm1$ eu; in the isotropic phase, $E_a{}'=10.0\pm0.2$ kcal mol^{-1} and $\Delta S^{\ddagger}=0\pm0.5$ eu. 33.65 PHOTOELECTRON SPECTRA

100456 High-resolution UV photoelectron spectrum of CO_2. I.Reineck, C.Nohre, R.Maripuu, P.Lodin, S.H.Al-Shamma, H.Veenhuizen, L.Karlsson, K.Seigbahn (Inst. of Phys., Uppsala Univ., Uppsala, Sweden).
Chem. Phys. (Netherlands), vol.78, no.3, p.311-18 (1 Aug. 1983).
The highly-resolved HeI photoelectron spectrum of CO_2 is presented and its vibrational structure studied in detail. In the $\tilde{X}^2\Pi_g$ ionic state the ν_3 antisymmetric mode is excited in double quanta (ν_1, ν_2, $\nu_3=0$, 0, 2) with energy $h\nu_3=181$ meV. In the $\tilde{C}^2\Sigma_g{}^+$ state a single quantum of the same mode is excited ($h\nu_3=189$ meV) in combination with a ν_1 excitation. Vibronic interaction with vibrational levels in the $\tilde{B}^2\Sigma_u{}^+$ state of the ion is suggested to promote this (1, 0, 1) excitation. It is established that inelastic scattering processes contribute to the vibrational structure in the $\tilde{C}^2\Sigma_g{}^+$ band. The spin-orbit splitting in the $\tilde{X}^2\Pi_g$ is 19 ± 1 meV and 10 ± 2 eV in the $\tilde{A}^2\Pi_u$ state. Vibronic structure is resolved in the $\tilde{X}^2\Pi_g$ band where the Renner-Teller coupling constant is $\varepsilon=0.21\pm0.02$ and the vibrational energy of the ν_2 mode as 60 ± 7 meV. In the $\tilde{A}^2\Pi_u$ state the ν_2 energy is found to be $h\nu_2\approx60$ meV from the observed hot-band structure. (21 refs.)

33.70 INTENSITIES AND SHAPES OF MOLECULAR SPECTRAL LINES AND BANDS

100457 On the Franck-Condon factor evaluation in harmonic approximation. B.P.Zapol'.
Latv. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR), no.3, p.41-5 (1983). In Russian.
Analytical expressions for Franck-Condon factor's amplitude in the harmonic approximation (i.e. for overlap integral of two linear harmonic oscillator wave functions) have been obtained. These expressions are useful for arbitrary values of oscillator's quantum numbers, frequencies and equilibrium positions; unlike Ansbacher's (1959) formula they never lead to any divergencies in intermediate results. (19 refs.)

100458 Line shape and moment analysis in depolarized induced light scattering. U.Bafile, R.Magli (Istituto di Fisica Superiore, Firenze, Italy), F.Barocchi, M.Zoppi, L.Frommhold.
Mol. Phys. (GB), vol.49, no.5, p.1149-66 (10 Aug. 1983).
The authors compare the two methods of deriving interaction-induced pair polarizabilities from collision-induced, depolarized spectra, namely classical line shape and moment analysis. They discuss their limitations and show that the joint use of line shape and moment analysis leads to the determination of an empirical pair polarizability anisotropy model which has maximal consistency with the available experimental results. They have applied the combined method to the pair spectrum of argon at room temperature (298K) as an example. (25 refs.)

100459 Semiempirical approach to the determination of the probabilities of electronic-vibrational-rotational radiative transitions of diatomic molecules. B.P.Lavrov, M.V.Tyutchev, V.I.Ustimov.
Opt. & Spectrosc. (USA), vol.54, no.1, p.2-3 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.4-6 (Jan. 1983).
The rigorous quantum-mechanical calculation and the correct purely experimental determination of the probabilities of electronic-vibrational-rotational radiative transitions (EVR RT) are extremely difficult. The authors therefore propose a new semiempirical approach to the problem. In this approach, a more or less theoretical analysis is used to express the complete set of probabilities being considered in terms of a finite (usually small) number of parameters describing the perturbation of the combining states and the vibrational-rotational interaction. The parameters appearing in the theoretical equations are determined using a limited amount of experimental data on the relative probabilities of the transitions and the radiative lifetimes of the levels. (3 refs.)

100460 Study of spectra of carbon-containing compounds behind a shock wave front. Determination of the oscillator strength of the $A^1\Pi$-$X^1\Sigma$ transition of the C_3 molecule. A.P.Monyakin, L.A.Kuznetsova.
Opt. & Spectrosc. (USA), vol.54, no.1, p.44-7 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.79-84 (Jan. 1983).
Absorption spectra of carbon-containing compounds behind the front of a shock wave (SW) propagated in a (C_3F_6+Ar) or (CH_4+Ar) mixture have been studied. Behind both the incident and the reflected SW, bands of the Swan system of the C_2 molecule and the pseudocontinuum of the $A^1\Pi$-$X^1\Sigma$ transition of the C_3 molecule were observed, superposed on the continuous absorption which increased in the short-wavelength region. It is shown that the continuous absorption was due to condensed carbon formed in the wall layer. It was also established that condensed carbon can exist in the flow core behind the reflected SW owing to the absence of chemical equilibrium in the system. On the basis of quantitative measurements of the intensity of the pseudocontinuum, the oscillator strength of the $A^1\Pi$-$X^1\Sigma$ transition of the C_3 molecule was determined, $f_e=0.044\pm0.020$. 33.80 PHOTON INTERACTIONS WITH MOLECULES

100461 Coherence in the quasi-continuum model. B.W.Shore (Lawrence Livermore Nat. Lab., Livermore, CA, USA).
Chem. Phys. Lett. (Netherlands), vol.99, no.3, p.240-3 (5 Aug. 1983).
It is shown that the diagonalization of internal molecular couplings to produce a photoabsorption quasicontinuum does not produce an incoherent absorption coefficient but maintains phase coherence in dipole moments. (35 refs.)

100462 Light scattering from gaseous nitrous oxide: effects of correlation between molecular and intermolecular axes upon the depolarization ratio in terms of the anisotropic potential choice. A.Chave, B.Dumon, A.Idrissi, M.Thibeau (Lab. d'Optique des Fluides, Univ. d'Angers, Angers, France).
Opt. Commun. (Netherlands), vol.47, no.1, p.36-41 (1 Aug. 1983).
The Rayleigh depolarized ratio of light scattered from gaseous nitrous oxide has been measured at pressure up to 50 bar and 293K with a 30 mW He-Ne laser (632.8 nm). The molecular specific scattering of this polar gas (including the effects of the orientational pair correlations (OPC), the collision induced scattering (CIS), and their interferences) are estimated in the DID approximation, assuming a Stockmayer intermolecular potential. The authors stress the importance of the conditions of symmetry. (20 refs.)

100463 Vacuum-ultraviolet stimulated emission from two-photon-excited molecular hydrogen. H.Pummer, H.Egger, T.S.Luk, T.Srinivasan, C.K.Rhodes (Dept. of Phys., Univ. of Illinois, Chicago, IL, USA).
Phys. Rev. A (USA), vol.28, no.2, p.795-801 (Aug. 1983).
Intense vacuum-ultraviolet stimulated emission in molecular hydrogen, on both the Lyman and Werner bands, following excitation by two-quantum absorption at 193 nm on the $X^1\Sigma_g^+ \rightarrow E,F^1\Sigma_g^+$ transition, has been observed. The shortest wavelength seen in the stimulated-emission spectrum was 117.6 nm corresponding to the $C^1\Pi_u \rightarrow X^1\Sigma_g^+$ (2-5) Q(2) transition. The $C^1\Pi_u$ state appears to be populated with a mechanism involving electron collisions. The radiative cascade mechanism found to lead to the vacuum-ultraviolet emissions on the Lyman band also causes strong infrared stimulated emission to occur on the $E,F^1\Sigma_g^+ \rightarrow B^1\Sigma_u^+$ band. Two entirely separate radiative excitation channels are observed to play important roles in the state-selective molecular population of the $E,F^1\Sigma_g^+$ level. One involves two 193-nm quanta in the $X \leftarrow E,F$ amplitude while the other process combines a 193-nm quantum with a first Stokes-shifted photon in H_2. The optical Stark effect was seen to play a significant role in the excitation process with shifts of molecular resonances as large as $\sim$45 cm^{-1}. Substantial deviations from Born-Oppenheimer behavior, resulting in a dramatic shift of the stimulated spectrum depending upon the excited-state rotational quantum number, were clearly observed for molecular levels close to the potential maximum separating the inner and outer wells of the $E,F^1\Sigma_g^+$ state. The maximum energy observed in the strongest stimulated line was $\sim$100 μJ, a value corresponding to an energy conversion efficiency of $\sim$0.5%. The pulse duration of the stimulated emission is estimated from collisional data to be $\sim$10 ps, a figure indicating a maximum converted vacuum-ultraviolet power of $\sim$10 MW. (34 refs.)

100464 Ultrafast physical effects in cyanine dyes subjected to tunable picosecond excitation. R.Gadonas, R.Danelyus, A.Piskarskas, S.Rentsch (V. Kapsukas State Univ., Vilnius, Lithuanian SSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.186-9 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.341-6 (Feb. 1983).
An analysis is made of the possibility of employing picosecond absorption spectroscopy based on continuously tunable excitation and probe sources in the investigation of complex kinetic processes. The results are presented of an investigation of various cyanine dyes. Calculations are made of the extinction coefficient of the excited state of one of the dyes. It is shown that the photoisomer 1,1′-diethyl-2,2′-monocarbocyanine, not observed previously, is formed within less than 50 psec. (12 refs.)

33.80E Autoionization, photoionization, and photodetachment

100465 K_2 Rydberg state analysis by two- and three-photon ionization. M.Broyer, J.Chevaleyre, G.Delacretaz, S.Martin, L.Woste (Inst. de Phys. Experimentale, Ecole Polytech. Federale de Lausanne, Lausanne, Switzerland).
Chem. Phys. Lett. (Netherlands), vol.99, no.3, p.206-12 (5 Aug. 1983).
The technique of resonant two- and three-photon ionization has been used to determine highly excited Rydberg states Ryb_n beyond and below the ionization limit. The extrapolation $n \rightarrow \infty$ yielded the K_2^+ molecular constants $\omega_e=73.4$ cm^{-1}, $\omega_e x_e=0.2$ cm^{-1}, IP=32775.5 cm^{-1} and $B_e=0.041$ cm^{-1}. Phenomena like rotational autoionization and field ionization of Ryb_n states are discussed. (14 refs.)

100466 Studies of the photoionization cross section of the 2π level of nitric oxide. M.E.Smith, R.R.Lucchese, V.McKoy (Arthur Amos Noyes Lab. of Chem. Phys., California Inst. of Technol., Pasadena, CA, USA).
J. Chem. Phys. (USA), vol.79, no.3, p.1360-3 (1 Aug. 1983).
The authors present photoionization cross sections and asymmetry parameters for the 2π level of nitric oxide which are obtained from the direct solution of the $e+NO^+$ collisional equations at the static-exchange level. These cross sections differ significantly from those obtained previously using a moment theory approach [J.J. Delaney, I.H. Hillier, and V.R. Saunders, J. Phys. B,

vol.15, p.1477 (1982)]. The calculated cross sections show a broad nonresonant feature at a photon energy of 29 eV which is not as pronounced as observed experimentally. The σ shape resonance in our cross section occurs at 14 eV which is about 5 eV below the feature in the measured cross sections attributed to this shape resonance. The probable role of autoionization and vibrational averaging on these cross sections is also discussed. (14 refs.)

100467 Zero-core-contribution calculation of a polyatomic photodetachment cross section: NO_2^-. W.B.Clodius, R.M.Stehman, S.B.Woo (Phys. Dept., Univ. of Delaware, Newark, DE, USA).
Phys. Rev. A (USA), vol.28, no.2, p.760-5 (Aug. 1983).
The zero-core-contribution method is extended to polyatomic anions and applied to the calculation of the photodetachment cross section of NO_2^-. Good agreement with experiment is found except near the threshold. The results near threshold are sensitive to the approximations used in the calculations. (15 refs.)

100468 Zero-core-contribution calculation of photodetachment characteristics of heteronuclear diatomic anions. W.B.Clodius, R.M.Stehman, S.B.Woo (Phys. Dept., Univ. of Delaware, Newark, DE, USA).
Phys. Rev. A (USA), vol.28, no.2, p.1160-3 (Aug. 1983).
The zero-core-contribution method is extended to study the photodetachment of heteronuclear diatomic molecules. Total photodetachment cross sections are calculated for the ions OH^-, SH^-, and SeH^-. The anisotropy factor β is also calculated for OH^-. The agreement with measured values of these quantities is good. (21 refs.)

33.80G Diffuse spectra; predissociation, photodissociation

100469 Semiclassical theory of predissociation induced by rotational (Coriolis) coupling. H.Nakamura (Div. of Theoretical Studies, Inst. for Molecular Sci., Okazaki, Japan).
Chem. Phys. (Netherlands), vol.78, no.2, p.235-41 (15 July 1983).
The dynamical-state representation and the multichannel quantum-defect theory of predissociation are used to formulate a semiclassical theory of predissociation of a diatomic molecule induced by Coriolis coupling. It is demonstrated that the simple perturbation theory becomes invalid when the rotational angular momentum quantum number is large, and that the nonperturbative formula developed in this paper should be employed. (18 refs.)

100470 Separation of deuterium by IR multiphoton decomposition of chlorodifluoromethane. IR multiphoton absorption by and decomposition of CF_2DCl/CF_2HCl mixture. K.O.Kutschke, M.Gauthier, P.A.Hackett (Div. of Chem., Nat. Res. Council of Canada, Ottawa, Canada).
Chem. Phys. (Netherlands), vol.78, no.3, p.323-30 (1 Aug. 1983).
IR multiphoton absorption by various pressures of CF_2HCl or of 1% CF_2DCl in CF_2HCl was studied at several 9P and 10R lines of the CO_2 laser using temporally unmodified pulses. Values of $\langle n \rangle$ for the individual molecules, and thus the optical selectivities, obtained from these data indicate that the molecule is not a promising candidate for deuterium separation in these frequency ranges. A measurement of D-isotope depletion during the multiphoton decomposition of the same mixture at 9P42 (1025.2 cm^{-1}) gave a minimum estimate of the isotopic selectivity of the dissociation process of 35. (36 refs.)

100471 Shape resonances and the photodissociation cross section of MgH near threshold. S.S.Bhattacharyya, D.Basu (Dept. of General Phys. & X-rays, Indian Assoc. for the Cultivation of Sci., Calcutta, India).
Chem. Phys. (Netherlands), vol.79, no.1, p.129-35 (15 Aug. 1983).
The photodissociation cross section of MgH has been calculated from the $\nu=0$ level of the ground electronic state $X\ {}^2\Sigma^+$ through the transition to the $B'\ {}^2\Sigma^+$ electronic state. The structure of the photodissociation cross-section curve against wavelength has been investigated near the theshold. It is shown that the shape resonances arising from the quasi-bound states play an important part in determining the form of the photodissociation cross-section curve near the threshold. (17 refs.)

100472 Cluster spectroscopy. J.Geraedts, S.Stolte, J.Reuss (Dept. of Phys., Catholic Univ. Nijmegen, Nijmegen, Netherlands).
Helv. Phys. Acta (Switzerland), vol.56, no.1-3, p.529-40 (1983). (Proceedings of the 3rd General Conference of the Condensed Matter Division of the EPS, Lausanne, Switzerland, 28-30 March 1983).
The authors study pre-dissociation of dimers in a molecular beam which is irradiated by IR lasers, e.g. Co_2-lasers or colour center lasers. Pre-dissociation spectra generally yield broad lines with little or no structure; with respect to the monomer band origins there occur apparently random lineshifts to the blue and/or to the red, which they explain. (36 refs.)

100473 Production of $O(^1D)$ and $O(^3P)$ by vacuum ultraviolet photodissociation of molecular oxygen. G.A.Germany, G.J.Salamo, R.J.Anderson (Dept. of Phys., Univ. of Arkansas, Fayetteville, AR, USA).
J. Appl. Phys. (USA), vol.54, no.8, p.4573-7 (Aug. 1983).
A pulsed fluorine excimer laser operating at 1576Å wavelength, 10 ns pulse width, 10 Hz repetition rate, and ~0.2 MW average output power is used to photodissociate ground state molecule oxygen, $O_2(X^3\Sigma_g^-)$. The dissociation products, $O(^1D)$ and $O(^3P)$, are produced with unit quantum efficiency and ~0.4 eV translation energy. Time-resolved techniques are used to monitor the $O(^1D_2) \rightarrow O(^3P_2)$ radiative transition over the O_2 pressure range 10-400 m Torr. The $O(^1D)$-O_2 quenching rate constant is determined to be $(3.7\pm0.3)\times10^{-11}$ $cm^3\ s^{-1}$. The $O(^1D)/O_2$ dissociation fraction is estimated to be 0.4% to ~50% corresponding to $O(^1D)$ densities as high as 3×10^{15} cm^{-3}. (18 refs.)

100474 Photodissociation processes in the OH molecule. E.F.van Dishoeck (Center for Astrophys., Cambridge, MA, USA), A.Dalgarno.
J. Chem. Phys. (USA), vol.79, no.2, p.873-88 (15 July 1983).
A systematic investigation of the excited states that may participate in the photodissociation of the OH molecule has been carried out by ab initio calculations which use two different self-consistent field with configuration-interaction methods. Potential energy curves for states of ${}^2\Sigma^+$, ${}^2\Sigma^-$, ${}^2\Pi$, and ${}^2\Delta$ symmetries have been computed and the transition dipole moments connecting the states have been obtained. Photodissociation cross sections for absorption from the $v''=0$ vibrational level of the ground $X^2\Pi$ state into the repulsive $1^2\Delta$, $B^2\Sigma^+$, and $2^2\Pi$ states are reported. It is shown that the $1^2\Delta$ and $B^2\Sigma^+$ states, together with the $1^2\Sigma^-$ state considered in an earlier study, are important channels for photodissociation. Photodissociation may take place also following absorption into bound electronic states and absorption oscillator strengths for these transitions have been determined. The mechanisms by which the bound states can be dissociated are discussed and estimates of the dissociation efficiencies of the mechanisms are made. Absorption into the bound $3^2\Pi$ state may be an important dissociation channel. Calculations of the interstellar photodissociation rate have assumed that photodissociation proceeds by absorption into the $C^2\Sigma^+$ state for which a large oscillator strength had been adopted. The authors find that the $C^2\Sigma^+$ channel is not significant in photodissociation and they present new estimates of the interstellar photodissociation rates. Their calculations demonstrate that OH is dissociated by the absorption of Lyman alpha radiation, a channel of particular significance in shocked interstellar gas and in cometary atmospheres. (22 refs.)

100475 Resonances in molecular collisions: importance of mode decoupling in the exit channel of attractive potentials. K.C.Kulander (Max-Planck-Inst. fur Quantenoptik, Garching, Germany).
J. Chem. Phys. (USA), vol.79, no.3, p.1279-85 (1 Aug. 1983).
Two model, collinear triatomic systems are investigated in which the intrafragment vibrational modes are decoupled from the interfragment bond distance in the dissociation channel. Resonances are found in both systems whose amplitudes are predominately outside the interaction region. The consequences of the existence of such resonances on reaction probabilities, dissociation rates, and absorption properties of states near the dissociation limit are discussed. (22 refs.)

100476 Dissociation dynamics of vibrationally excited van der Waals clusters: $I_2XY \rightarrow I_2X+Y$ (X, Y=He, Ne). G.C.Schatz, V.Buch, M.A.Ratner, R.B.Gerber (Dept. of Chem., Northwestern Univ., Evanston, IL, USA).
J. Chem. Phys. (USA), vol.79, no.4, p.1808-22 (15 Aug. 1983).
The dynamics of sequential dissociation processes of the type $XI_2(\nu)Y \rightarrow X+I_2(\nu')Y \rightarrow X+Y+I_2(\nu'')$ (X,Y=Ne,He) are studied using classical trajectory calculations and a recently presented classical version of the time-dependent self-consistent field (TDSCF) method. The results obtained indicate the presence of significant dynamical correlation effects of the rare-gas atoms on each other despite the negligible direct interaction between them; this is in qualitative agreement with experimental findings. Good agreement is found for the rate constants and the variation with rare gas as well as the branching ratios ($NeI_2He \rightarrow NeI_2+He$ vs. $\rightarrow I_2He+Ne$) calculated from TDSCF and from classical trajectories. Both classical trajectories TDSCF show an essentially impulsive dissociation mechanism, in which dissociation typically follows a considerable number of vibrations, and is due to a relatively rare internal hard collision between an I atom and the rare gas. As in the three-body I_2X case, this mechanism differs from that in the RRKM strong coupling model. Energy- and momentum-gap relations, based on the weak-coupling picture, are found to be relatively successful but fail to describe the dynamics quantitatively. (27 refs.)

100477 Rotational predissociation of $H_2^{+\cdot}$ ions of different precursor origins. A.G.Brenton, J.H.Beynon (Royal Society Res. Unit, Univ. Coll. of Swansea, Swansea, Wales), E.G.Richard, P.G.Fournier.
J. Chem. Phys. (USA), vol.79, no.4, p.1834-45 (15 Aug. 1983).
The rovibronic state of ground state $(1s\ \sigma_g)H_2^{+\cdot}$ that can fragment by the mechanism of rotational predissociation have been predicted theoretically and so have the lifetimes of these states. Six of these predicted quasibound states have previously been detected using a mass spectrometric method in which states are characterized by determining the translational energy released during the fragmentation process. In the present investigation, $H_2^{+\cdot}$ has been prepared, not from hydrogen gas itself, but from a number of organic molecules by electron bombardment. It is shown that by this method, H_2^+ appears in highly rotationally excited states and that the relative population densities of the states varies from compound to compound. The relative lifetimes of the fragmenting states have been investigated by varying the time after formation of the $H_2^{+\cdot}$ ions in which observations of fragmentation are made. A total of nine quasibound states in $H_2^{+\cdot}$ from methane were observed and assigned from theoretical calculations. Bound and quasibound states of $H_2^{+\cdot}$ molecular ions have been calculated in the framework of the Born-Oppenheimer approximation. The energy levels and lifetimes with respect to predissociation of these quasibound states are determined. The effect of adiabatic corrections are estimated and discussed. (54 refs.)

100478 Yield of excited iodine atoms during many-photon dissociation of CF_3I and $(CF_3)_3CI$. I.A.Boriev, A.M.Velichko, E.B.Gordon, A.A.Nadeikin, A.I.Nikitin, V.L.Tal'roze (Inst. of Chem. Phys., Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.5, p.259-61 (5 March 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.5, p.218-20 (5 March 1983).
The yield of iodine atoms in the ${}^2P_{1/2}$ and ${}^2P_{3/2}$ states has been measured directly for the first time during many-photon dissociation of CF_3I and $(CF_3)_3Ci$ by the beam from a CO_2 laser. The yield of excited iodine $I^*({}^2P_{1/2})$ is essentially the same for the two molecules to comparable degrees of dissociation. (7 refs.)

100479 Photodissociation of polymethine dye solutions under laser excitation. A.V.Kazymov, E.N.Kaliteevskaya, T.K.Razumova, E.P.Shchelkina.
Opt. & Spectrosc. (USA), vol.54, no.1, p.63-7 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.111-17 (Jan. 1983).
The general laws of irreversible photodissociation of polymethine dyes under high-power excitation within the longwave absorption band are studied. It is shown that the ratio of the number of dissociated molecules to the number of absorbed photons (B) differs from the photodissociation yield (ϕ) determined by the absorption of radiation by unexcited molecules. This difference is mainly tied to processes of light quenching and transitions with absorption between excited states. In the Stokes region of excitation $B\leq\phi$, while B can be larger than ϕ in the anti-Stokes region. (19 refs.)

100480 Photofragment spectroscopy of N_2^{2+}. P.C.Cosby, R.Moller, H.Helm (Molecular Phys. Lab., SRI Internat., Menlo Park, CA, USA).
Phys. Rev. A (USA), vol.28, no.2, p.766-72 (Aug. 1983).
N_2^{2+} ions, produced by electron impact of N_2, are observed to predissociate into N^++N^+ when irradiated by a dye laser at photon energies between 14900 and 19500 cm^{-1}. Five structured bands in the spectrum are associated with absorptions from $X^1\Sigma_g^+$ (v=0, 1, 2,) into three predissociated levels of the $1^1\Pi_u$ state. The two highest levels of the $1^1\Pi_u$ are believed to dissociate by tunneling through the Coulombic barrier in its potential-energy curve, whereas the lowest level is predissociated by the $1^1\Sigma_u^-$ state. Kinetic-energy analysis of the N^+ photofragments establishes the energy of $X^1\Sigma_g^+$ (v=0) at 4.8 ± 0.2 eV above the N^++N^+ dissociation asymptote and yields an adiabatic appearance potential of 43.6 ± 0.2 eV. Molecular constants for the $X^1\Sigma_g^+$ and $1^1\Pi_u$ states are determined. (27 refs.)

100481 Dissociation of SF_6 molecules in an infrared laser field under gasdynamic cooling conditions. S.S.Alimpiev, G.S.Baronov, S.M.Karavaev, V.A.Martsynk'yan, A.V.Merzlyakov, S.M.Nikiforov, B.G.Sartakov, E.M.Khokhlov, A.L.Shtarkov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.2, p.208-12 (Feb. 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.2, p.376-83 (Feb. 1983).
The method of HF* luminescence was used to measure the energy and spectral dependences of the dissociation yield of SF_6 gas under conditions of gasdynamic cooling to a temperature of ~30°K. Single- and two-frequency illumination in the fields of discretely tunable TEA CO_2 lasers was employed. (13 refs.)

33.80K Multiphoton processes

100482 Narrowing of a two-photon resonance due to elastic collisions. V.P.Chebotayev, V.A.Ulybin (Inst. of Thermophys., Acad. of Sci., Novosibirsk, USSR).
Appl. Phys. B (Germany), vol.B31, no.4, p.249-52 (Aug. 1983).
The lineshape of two-photon absorption in a standing-wave field during elastic collisions is studied. It has been found that the transit broadening of the two-photon resonance on vibrational-rotational molecular transitions is sharply decreased because of an increase in the time of interaction of particles with the electromagnetic field due to elastic collisions. The effect considered allows one to obtain supernarrow optical resonances of two-photon absorption in a low-pressure gas with high intensity. (7 refs.)

100483 Effects of dissociative intermediate states on the vibronic dephasing in visible/ultraviolet multiphoton transitions of gaseous molecules. Y.Fujimura, T.Nakajima (Dept. of Chem., Tohoku Univ., Sendai, Japan), M.Kawasaki, H.Sato, I.Tanaka.
J. Phys. Chem. (USA), vol.87, no.13, p.2277-9 (23 June 1983).
Vibronic dephasing bringing about sequential multiphoton transition via dissociative intermediate states is studied. A linear interaction potential in the repulsive manifold makes a significant contribution to the frequency-dependent dephasing constant. This constant is calculated for the I_2 multiphoton transition via the $^1\Pi_{1u}$ state. (13 refs.)

100484 Observation of proton and electron detachment from an anthracene molecule during pronounced IR many-photon superexcitation. V.N.Bagratashvili, M.V.Kuz'min, V.S.Letokhov, A.N.Shibanov (Inst. of Spectroscopy, Acad. of Sci., USSR).
JETP Lett. (USA), vol.37, no.2, p.112-16 (20 Jan. 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.2, p.92-5 (20 Jan. 1983).
The detachment of a proton and an electron from a large polyatomic molecule (anthracene) has been observed (for the first time) during pronounced IR many-photon superexcitation of the molecule above the dissociation boundary in the electronic ground state. (9 refs.)

100485 Mode-selective multiphoton excitation in a model system. R.E.Wvatt (Inst. for Molecular Sci., Okazaki, Japan), G.Hose, H.S.Taylor.
Phys. Rev. A (USA), vol.28, no.2, p.815-28 (Aug. 1983).
A computational study is made of mode-selective multiphoton excitation in a model nonseparable anharmonic-oscillator system. The time evolution of quantal wave packets on the Henon-Heiles potential surface is treated via Floquet theory; periodicity of the classical laser field, $E_0\cos\omega t$, is utilized to formulate the propagator for the state amplitudes. In a previous study by Hose and Taylor (1982), a criterion was developed by which the quantum states corresponding to the classical quasiperiodic motion are identified. Two types of quasiperiodic states exist in the Henon-Heiles system: Q^I, the normal mode and Q^{II}, a local (bond) mode; highly mode-mixed states are designated as N (nonquasiperiodic). In the present study it is found that efficient multiphoton excitation into a subset of the Q^I states lying between the classical critical energy and the dissociation barrier is obtained, provided that the field strength is not too large and the frequency of the laser is tuned to the fundamental of the Q^I ladder. Implications for mode-selective excitation in real systems are discussed. (40 refs.)

100486 Resonant multiphoton interaction of noise radiation with a generalized two-level system. G.M.Krochik, N.M.Krochik (Sci.-Res. Inst. of Intermediate Organic Products & Dyes, USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.9, p.715-26 (Sept. 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.9, p.998-1011 (Sept. 1982).
Considers the multiphoton interaction of a light field, randomly modulated by a complex Gaussian process, with a generalized two-level system. It is shown that the shift and broadening of the transition line, caused by the quadratic Stark effect and by the presence of multiphoton resonance, saturate in a strong noise field. The resonant transition then becomes asymmetric. The authors study the multiphoton resonant ionization, find the conditions of the applicability of the averaged velocity equations, and establish the regimes which differ from the resonant multiphoton ionization in a monochromatic field. A good agreement of the calculated results with the available results of experiments on the multiphoton processes in noise fields is obtained. (15 refs.)

34.00 ATOMIC AND MOLECULAR COLLISION PROCESSES AND INTERACTIONS

34.10 GENERAL THEORIES AND MODELS

(inc. statistical theories, transition state, stochastic and trajectory models, etc; see also 82.20)

100487 Modified quasiclassical description of collisions of atomic particles at medium and low energies. V.A.Sidorovich, V.S.Nikolaev.
Opt. & Spectrosc. (USA), vol.54, no.1, p.30-3 (Jan. 1983). Translation of: *Opt. & Spektrosk. (USSR)*, vol.54, no.1, p.54-9 (Jan. 1983).
On the basis of a quantum-mechanical treatment of the scattering problem, an extrapolation of the quasiclassical method to the case of scattering of atomic particles at medium and low energies of collision is proposed. The proposed modification of the quasiclassical method refines the well-known Vainshtein-Vinogradov modification and correctly takes into account the region of possible values of transferred momentum. Comparison of the Born cross sections for the 1*s*-2*s* excitation of hydrogen atoms by electrons without consideration of exchange, obtained on the basis of two modifications of the quasiclassical method and in quantum mechanics, shows that the present modification substantially improves the Vainshtein-Vinogradov results in the region of collision energies up to the cross-section maximum and leads to cross sections identical with the quantum-mechanical ones in the entire region of collision energies starting from the reaction threshold. (17 refs.)

34.20 INTERATOMIC AND INTERMOLECULAR POTENTIALS AND FORCES

(for molecular solids, see 31.70K)

100488 Formation of weak hydrogen-bonded complexes as predicted by experimental atomic charges. M.Gussoni (Istituto di Chimica Fisica Applicata dei Materiali, CNR, Genoa, Italy), C.Castiglioni, G.Zerbi.
Chem. Phys. Lett. (Netherlands), vol.99, no.2, p.101-6 (29 July 1983).
A very simple electrostatic model for the binding energy in weak intermolecular interaction is proposed. The model requires the knowledge of atomic equilibrium charges which can be derived from molecular dipole moments and infrared intensities. The binding energy computed with this model for hydrogen-bonded complexes of known geometry agrees very well with the observed one. A further simplification of the model may indicate which of the two molecules forming the complex acts as proton donor when the geometry of the complex is not known. (37 refs.)

100489 Note on a theoretical interpretation of the isotopic ratio $\bar{\nu}_{OH}/\bar{\nu}_{OD}$ versus $\bar{\nu}_{OH}$ in isotopically diluted HDO molecules in solid hydrates. M.J.Wojcik, J.Lindgren, J.Tegenfeldt (Inst. of Chem., Univ. of Uppsala, Uppsala, Sweden).
Chem. Phys. Lett. (Netherlands), vol.99, no.2, p.112-15 (29 July 1983).
A simple intra- and inter-molecular potential for water molecules engaged in hydrogen bonding has been used in a one-dimensional approximation for a theoretical interpretation of the experimental correlation $\bar{\nu}_{OH}/\bar{\nu}_{OD}$ versus $\bar{\nu}_{OH}$ in solid hydrates. The variation in the equilibrium O-H(D) distance has also been considered. (12 refs.)

100490 Study of the additivity of internal and external potentials for simple complexes of the HDO molecule. M.J.Wojcik, J.Lindgren (Inst. of Chem., Univ. of Uppsala, Uppsala, Sweden).
Chem. Phys. Lett. (Netherlands), vol.99, no.2, p.116-19 (29 July 1983).
Additive internal and external potentials for simple complexes of the HDO molecule have been studied by polynomial fitting and solution of the variational problem. Structural and spectroscopic properties calculated allow one to evaluate the applicability of these potentials to study more complex hydrates. (30 refs.)

100491 A study of the valence interaction integrals in effective core potential applications. L.G.M.Pettersson (Inst. of Theoretical Phys., Univ. of Stockholm, Stockholm, Sweden), A.Stromberg.
Chem. Phys. Lett. (Netherlands), vol.99, no.2, p.122-8 (29 July 1983).
The valence interactions in two effective core potential (ECP) methods, the frozen orbital ECP and the method of Sakai and Huzinaga (1982), are shown to yield atomic valence orbital Coulomb and exchange interaction integrals closely approximating all-electron calculations. The ECP approximation is studied in some detail with special application in the ScO molecule. The too short bond distance in ScO when the 3s, 3p orbitals are included in the core is shown to stem from a long-range attraction of the ECP. (23 refs.)

100492 The stability of the RKR inversion procedure to errors in the spectroscopic data: origin of the inner-wall ripple. B.H.Wells, E.B.Smith (Phys. Chem. Lab., Univ. of Oxford, Oxford, England), R.N.Zare.
Chem. Phys. Lett. (Netherlands), vol.99, no.3, p.244-9 (5 Aug. 1983).
The origin of the non-physical inner-wall behaviour frequently encountered in the RKR inversion procedure is discussed. The RKR procedure is found to be

very sensitive to errors in the rotational data, but less demanding on the quality of the vibrational data. (9 refs.)

100493 Rydberg states of van der Waals molecules—a comparison with Rydberg states of atoms and chemically bonded species. P.M.Dehmer (Argonne Nat. Lab., Argonne, IL, USA).
Comments At. & Mol. Phys. (GB), vol.13, no.5, p.205-27 (1983).
The Rydberg spectra of van der Waals molecules are examined using the spectra of the homonuclear and heteronuclear rare gas dimers as examples. Owing to significant interchannel coupling, the molecular spectra often are complex and the simple analogy between atomic and molecular Rydberg structure is of limited use in analyzing the VUV spectra of these species. The more general question of the applicability of the multichannel quantum defect theory (MQDT) for the analysis of rotationally unresolved molecular spectra such as those presented is considered. It is suggested that the Rydberg spectra of certain van der Waals molecules may be midway in complexity between the spectra of simple diatomics such as He_2 or H_2 and the spectra of polyatomics. Analyses of such van der Waals Rydberg spectra using MQDT may help assess the potential and the limitations of this technique. (77 refs.)

100494 Transport properties of ground state nitrogen atoms. J.C.Rainwater (Nat. Engng. Lab., NBS, Boulder, CO, USA), L.Biolsi, K.J.Biolsi, P.M.Holland.
J. Chem. Phys. (USA), vol.79, no.3, p.1462-8 (1 Aug. 1983).
Transport properties of dilute monatomic gases depend on the two body atom-atom interaction potential. When two ground state (^4S) nitrogen atoms interact, they can follow any of four potential energy curves corresponding to the N_2 molecule; the $X^1\Sigma_g^+$, $A^3\Sigma_g^+$, $^5\Sigma_u^+$ and $^7\Sigma_u$ curves. Transport collision integrals for the $^1\Sigma_g^+$ and $^3\Sigma_u^+$ states have been calculated by representing the potentials for these states with the Hulburt-Hirschfelder potential. The $^5\Sigma_g^+$ state has a large local maximum which requires changes in the computational procedure used previously; a modified Hulburt-Hirschfelder potential has been used to represent the potential for this state. Collision integrals for the $^7\Sigma_u^+$ state have been obtained by direct use of a recent theoretical potential for this state. The collision integrals are compared with results obtained in previous studies. (51 refs.)

100495 Density functional calculations for H_2O, NH_3, and CO_2 using localized muffin-tin orbitals. J.E.Muller, R.O.Jones, J.Harris (Inst. fur Festkorperforschung, KFA Julich, Julich, Germany).
J. Chem. Phys. (USA), vol.79, no.4, p.1874-84 (15 Aug. 1983).
